When the operation is completed the potash bulbs and calcium chloride tube are allowed to cool down to the atmospheric temperature and then again weighed. The increase in weight gives the respective amounts of carbon dioxide and water produced. Since carbon dioxide contains in 11 parts by weight 3 of carbon ($\text{CO}_2 = 12 + 2 \times 16 = 44$), $\frac{3}{11}$ of the weight of the CO_2 obtained is due to carbon. Similarly $\frac{1}{9}$ of the weight of the water found is due to hydrogen ($\text{H}_2\text{O} = 2 \times 1 + 16 = 18$). It is customary to express the results in parts per cent. In practice the hydrogen usually comes out a little too high, and the carbon a little too low.

Cupric oxide is sometimes replaced by lead chromate in cases where the substance is difficultly combustible, and more particularly when the compound contains chlorine, bromine, or sulphur. In these latter cases were cupric oxide employed, cupric chloride or bromide would be formed, and might volatilize over into the calcium chloride tube, thus unduly increasing its weight. Sulphur in

presence of cupric oxide is oxidized to SO_2 , and this gas if allowed to pass into the potash bulbs would be absorbed. These sources of error are avoided by the employment of lead chromate, because non-volatile lead chloride or bromide are formed, and sulphur is oxidized to SO_3 , which is fixed as PbSO_4 . When substances rich in nitrogen are burnt with cupric oxide, nitrogen dioxide is likely to be formed, and this on meeting the air and potash in the bulbs is absorbed, and increases the weight of the CO_2 apparatus. To obviate this source of error it is necessary when dealing with nitrogenous bodies to plug the end of the combustion tube with a roll of freshly reduced copper gauze. This being kept at a bright red heat during the entire operation decomposes the oxides of nitrogen, and retaining the oxygen, allows only nitrogen to escape.¹

When the substance to be analyzed is a liquid, a known weight is sealed up in a small glass bulb (fig. 6).

After sealing and weighing (the weight of the empty bulb having been previously determined) the neck of the bulb is broken off, and the broken portion, together with the bulb itself, introduced into the combustion tube, which is afterwards filled up with cupric oxide, &c., in the usual manner. In burning liquids the anterior portion of the combustion tube is, as with solids, first heated to redness; the portion containing the bulb is then gradually warmed so as to expel the liquid, which is thus made to distil slowly over the red-hot cupric oxide which effects its combustion.

The analysis of gaseous organic compounds is effected in *eudiometers*, or in special apparatus, of which several forms have been devised. (See Bunsen's *Gasometry*, Sutton's *Volumetric Analysis*, Thorpe's *Quantitative Analysis*, &c.)

Determination of Nitrogen.—Two methods are in use for determining this element. Will and Varrentrapp's method depends upon the fact that many nitrogenous bodies when heated with caustic alkalis yield their nitrogen in the form of ammonia. A known weight of the substance is intimately mixed with soda-lime,² and then heated in a combustion tube, the ammonia being absorbed by dilute hydrochloric acid contained in a glass apparatus attached to the end of the tube. (See fig. 7.)

In conducting an operation of this kind some soda-lime is first introduced into the tube; the substance is then mixed intimately with more soda-lime in a mortar, and the mixture transferred to the tube; the mortar

Fig. 7.—Determination of Nitrogen by Will and Varrentrapp's method.

A B, combustion tube; a b, soda-lime; b c, mixture; c d, thinsings; d e, soda-lime; e f, asbestos plug; G, acid bulbs.

is next rinsed out with more soda-lime, and the rinsings are added to the contents of the tube, which is finally filled up with pure soda-lime. When charged the tube is tapped so as to secure a free passage for the escaping gas

(as in the combustion for the determination of C and H), and after it is laid in the trough of the gas furnace, the acid bulb is attached to it by means of a tightly fitting cork. The combustion is performed in precisely the same manner as in the process of burning with cupric oxide; when it is completed the tail of the tube is broken off, and air drawn through the apparatus so as to draw the last traces of ammonia into the acid. If the substance contains much nitrogen it is advisable to mix it with some compound which gives off a large quantity of gas when heated in the tube. Sugar or starch are convenient substances for this purpose. This dilution of the ammonia prevents its too rapid absorption by the acid, and thus diminishes the risk of acid being drawn back into the hot tube.

Having by the above process obtained the nitrogen in the form of ammonium chloride, its quantity is determined by precipitation as ammonio-platinic chloride, $(\text{NH}_4)_2\text{PtCl}_6$, the analysis being performed in the same manner as in the quantitative determination of ammonium by means of platinic chloride. In calculating the results the requisite data are furnished by the facts that 223.2 parts of the double salt contain 14 of nitrogen, or 197.5 parts of platinum correspond to 28 of nitrogen. Thus, if w = weight of substance taken, W the weight of double salt obtained, P the weight of platinum, and N the weight of nitrogen, we have $N = \frac{W \times 14}{223.2}$ or $\frac{P \times 28}{197.5}$; also $\frac{100N}{w}$ for the percentage of nitrogen.

Instead of determining the ammonia gravimetrically it may be absorbed by a known quantity of dilute sulphuric acid of standard strength, and the amount of acid neutralized determined by adding litmus, and then a standard solution of soda till complete neutralization is effected as in ordinary acidimetric determinations.

In cases where nitrogen-containing bodies do not yield the whole of that element as ammonia on ignition with soda-lime, Dumas's process is employed. This process depends upon the fact that all nitrogenous substances yield their nitrogen in the free state when burnt with cupric oxide, and in presence of ignited metallic copper. The method is thus carried out.

A combustion tube of suitable length is sealed off at one end, and about 2 or 3 inches of hydrogen sodium carbonate (NaHCO_3) introduced, after which a small quantity of cupric oxide is added. A known quantity of the substance, intimately mixed with cupric oxide, is next introduced, and then a further quantity of pure cupric oxide, the remainder of the tube being finally filled up with 3 or 4 inches of freshly reduced copper gauze plugging. No special precautions need be taken to keep the cupric oxide dry. A gas passage having been secured through the tube in the usual manner, a delivery tube is tightly adapted to the open end of the combustion tube.

The tube is placed in a gas furnace, and the end of the delivery tube plunged beneath the surface of mercury contained in a mercurial trough. The first proceeding is to expel the air from the apparatus. This is effected by heating a portion of the hydrogen sodium carbonate in the posterior part of the combustion tube till a bubble of the gas received into caustic potash solution is wholly absorbed. When the apparatus is entirely filled with carbon dioxide, a graduated receiver containing about $\frac{1}{3}$ of its volume of caustic potash solution, the remainder being filled with mercury, is inverted over the end of the delivery tube as in ordinary cases of gas-receiving over the mercurial trough. The combustion is then proceeded with in the usual manner,—the anterior portion of the tube containing the metallic copper being first heated to redness, and the heat gradually carried back till the combustion is completed, when more of the NaHCO_3 in the posterior part is heated

¹ Although the principles upon which the determination of carbon and hydrogen in organic bodies depends remain unaltered, the process has received several modifications which it is unnecessary to describe in detail. Thus in some laboratories, instead of the potash bulbs, a tube filled with "soda-lime" is employed, and the substance, instead of being mixed with the CuO in the tube, is placed in a small boat of porcelain or platinum, and a slow stream of oxygen kept going during the whole process. Other oxidizers have been also proposed instead of cupric oxide, such as potassium perchlorate or a mixture of sulphuric acid and silver iodate; in which latter process the carbon is determined directly from the amount of CO_2 produced, and the hydrogen indirectly from the amount of oxygen consumed minus the quantity contained in the CO_2 .

² Soda-lime is prepared by slaking quicklime with a strong solution of caustic soda, and then heating till thoroughly dry.

so as to expel the last traces of nitrogen. The CO_2 produced by the combustion and from the NaHCO_3 being absorbed by the potash solution, the graduated receiver contains only the whole volume of pure nitrogen. The receiver and its contents are accordingly transferred to a vessel of water—the mercury and potash solution allowed to be replaced by water, the receiver is raised till the pressure is equalized by the water being at the same level both inside and outside, and the volume of gas is read off, the temperature of the air of the room and the height of the barometer being at the same time noted.

If N = weight of nitrogen in grammes, t° the temperature of the air, h the height of the barometer, e the tension of aqueous vapour at the temperature t° , and V the volume of nitrogen in cubic centimetres—

$$N = V \cdot \frac{0.0012562}{(1 + 0.00367t/273)} \cdot b - e$$

(0.0012562 being wt. of 1 c.c. of N at 0°C . and 760 mm. bar.).

Determination of the Halogen Elements, Sulphur, and Phosphorus.—The halogens are sometimes determined as silver salts, by burning a known weight of the substance with pure quicklime in a combustion tube, dissolving in dilute nitric acid, and adding silver nitrate. Sulphur and phosphorus may be determined by fusing a known quantity of the substance with a mixture of potassium hydroxide and nitrate in a silver dish. The sulphur is by this means oxidized to sulphuric and the phosphorus to phosphoric acid, and, on dissolving the fused mass and acidulating, these acids can be estimated.

By the method of Carius the halogens, sulphur, and phosphorus can be determined, if necessary, in one operation. A known weight of the substance is sealed up in a strong glass tube with about 20 times its weight of nitric acid (sp. gr. 1.4), and the tube then heated for some hours in an oil-bath to a temperature of $140^\circ - 300^\circ \text{C}$. The substance is completely oxidized by this operation, the sulphur and phosphorus being converted into their respective acids, so that their determination then becomes an operation of inorganic analysis. If halogens are present, it is customary to add a few crystals of silver nitrate before sealing up the tube. After the operation the haloid silver salt is filtered off, the excess of silver is removed from the filtrate by HCl , and H_2SO_4 or H_3PO_4 is determined in the ordinary way.

Determination of Oxygen.—Although several processes have been devised for the direct estimation of oxygen (by Bannhauer, Maumend, and Mitscherlich), they are seldom employed in laboratories. This element is usually determined by "difference," i.e., by adding the percentages of the other elements, and subtracting the result from 100.

Formulae and Constitution of Organic Compounds.

Empirical Formula.—Having by the above methods of analysis arrived at the percentage composition of a substance, the next step is to determine its formula. The empirical formula is obtained by dividing each percentage number by the atomic weight of its respective element. Thus, supposing an analysis of common alcohol gave the following percentage numbers:—

Carbon.....	52.15
Hydrogen.....	13.06
Oxygen (by difference).....	34.79
	100.00

Dividing these by the respective atomic weights—

$$\text{C} = \frac{52.15}{12} = 4.3, \text{H} = \frac{13.06}{1} = 13.0, \text{O} = \frac{34.79}{16} = 2.2.$$

These numbers show that the atoms of C, H, and O are

present in numbers having the ratios 2 : 6 : 1, since by the atomic theory the atoms of each element must exist in a compound in integral numbers. The differences between the integral and fractional numbers are justly assignable to the unavoidable "experimental errors" of analysis. Thus the simplest formula that can be given to alcohol from the foregoing analysis is $\text{C}_2\text{H}_6\text{O}$, and it is usual to express the results in the following manner:—

Theory $\text{C}_2\text{H}_6\text{O}$.	Found.
$\text{C}_2 = 24 = 52.17$	C.....52.15
$\text{H}_6 = 6 = 13.04$	H.....13.06
$\text{O} = 16 = 31.79$	O (by difference) 34.79
46 100.00	100.00

This imaginary example may serve to show that the determination of empirical formulae cannot be made according to any fixed set of rules. The errors of experiment are seldom so small as in the supposed illustration, and in cases where these are large, and where the substance contains a large number of atoms in its molecule, great difficulty is often experienced.

Molecular Formula.—The formulae obtained by the method just described express simply the ratios existing between the numbers of atoms in the molecule of a substance, without regard to the actual number of atoms in such a molecule. Reasoning downwards from the law of Avogadro, which has been explained in the foregoing portions of this article, it will be seen that the volume of such molecules as do not undergo dissociation when heated is always equal to the volume of the molecule (2 parts by weight) of hydrogen. To ascertain molecular formula, therefore, all that is necessary is to determine the vapour-density of the substance as referred to hydrogen. Thus the analysis of benzene, a hydrocarbon obtained from coal tar, leads to the formula CH , but there is no evidence to show whether its molecular formula is CH , C_2H_2 , C_3H_3 , C_4H_4 , C_5H_5 , or C_nH_n . By experiment its vapour density is found to be 39, so that its molecular weight is 78. Dividing this number in the ratio C : H, i.e., 12 : 1, we obtain 72 : 6 as the actual ratio of the weights of C and H existing in the molecule. Seventy-two parts of C correspond to $\frac{72}{12} = 6$ atoms, and 6 parts by weight of hydrogen correspond to $\frac{6}{1} = 6$ atoms, so that the molecular formula of benzene is C_6H_6 .

Again, with respect to alcohol. The vapour-density ($\text{H} = 1$) is 23, so that its molecular weight is 46. This number, however, agrees with the molecular weight of a substance having the formula $\text{C}_2\text{H}_6\text{O}$, since $12 \times 2 + 6 + 16 = 46$; hence this formula must be assigned to alcohol, and we have an illustration of a case in which the empirical and molecular formulae are identical.

Determination of Vapour-density.

In practice, the vapour-density is determined by the methods of Dumas or Hofmann.

Dumas's Method.—In Dumas's process the weight of a known volume of vapour is ascertained in the following manner (see fig. 8).

A globular glass flask, as light as possible, with a neck fused into it, is first provided. The capacity of the globe may vary from $\frac{1}{16}$ to $\frac{1}{2}$ litre, according to the amount of substance to be operated upon. The neck is drawn out in the blowpipe flame to a capillary termination of about one millimetre diameter, and then bent up so as to project above the surface of the liquid of the bath in which the globe is to be immersed. The globe is first weighed full of air—the temperature and height of the barometer being noted.

By warming the globe, and plunging the point of the neck into some of the liquid of which the vapour-density is to be determined, a few grammes of the latter are introduced. The globe and its contents are then plunged into a bath of water, paraffin, or fusible metal kept at a constant temperature, at least 26° or 30°C above the boiling-point of the substance. As soon as the vapour ceases to rush out of the capillary orifice of the neck, the point is sealed hermetically by the blowpipe flame, the height of the barometer and the temperature of the bath being observed.

The globe, after being cleaned and allowed to cool, is again weighed, the temperature and height of the barometer being at the same time observed. The capacity of the globe is measured by breaking the point of the neck under mercury, when the metal rushes in to supply the place of the condensed vapour. As the expulsion of air by the escaping vapour is seldom complete, there usually remains a bubble of residual air, which must be allowed for by running in a known quantity of mercury from a burette. The total quantity of mercury is then poured out and its volume measured. The calculation is made from these data by the following approximative method:—

Let m = weight of globe + air at the temperature t of weighing and height of barometer b ;
 m' = weight of globe + vapour at the temperature t' of sealing and height of barometer b' ;
 V = capacity of globe in cubic centimetres;
 λ = weight of V cubic centimetres of air at t and b .
 Then $m - \lambda$ = weight of vacuous globe;
 $m' - (m - \lambda)$ = weight of substance.
 Let H = wt. of V c.c. of hydrogen at t' and b' , then the vapour-density (d) referred to hydrogen is

$$d = \frac{m' - (m - \lambda)}{H}$$

When residual air (r) is found in the globe, $V - r$ = capacity of globe.

In very exact determinations corrections must be made for (1) the expansion of glass, (2) the difference of temperature and pressure between the first and second weighings of the globe, and (3) the difference in density between the drop of fluid remaining in the globe and the density of mercury. For most chemical purposes, however, the above-given approximation formula is sufficiently accurate.

For high temperatures the globe is immersed in the vapours of boiling mercury, cadmium, or zinc, and the apparatus is modified accordingly.

Gay-Lussac and Hofmann's Methods.
 —These methods have for their object the measurement of the volume of a known weight of vapour. Gay-Lussac's method, being available only for substances boiling below 100°C ., has been gradually replaced by Hofmann's modification (fig. 9).

A glass tube about 1 metre in length and 20 mm. diameter, closed at one end, is graduated and calibrated. The tube being filled with mercury, and inverted in a vessel of the same liquid, is surrounded by a wider tube, through which the vapour of any liquid boiling at a constant temperature can be passed, and thus the barometer tube and its contents kept at that temperature.

The substance of which the vapour-density is to be determined is weighed (about $\frac{1}{10}$ gram.) in a minute stoppered bottle, and passed up into the Torricellian vacuum. According to the boiling-point of the substance (which is, of course, much lowered by the reduced pressure), the vapour of alcohol, water, aniline, or any other liquid is passed through the space between the

FIG. 8.—Dumas's Vapour-density Apparatus.

FIG. 9. Hofmann's Vapour-density Apparatus.

AA, graduated barometer tube standing in funnel; h, height of mercury column; BB, outer glass cylinder enclosing barometer tube; t, tube by which hot vapour is introduced; t', tube by which hot vapour and overflow of mercury escape; t is connected with the flask of boiling liquid, and t' with a condenser.

standing in funnel. According to the boiling-point of the substance (which is, of course, much lowered by the reduced pressure), the vapour of alcohol, water, aniline, or any other liquid is passed through the space between the

two tubes till the temperature and volume of vapour remain constant. The height of the mercury column, the temperature to which the vapour is heated, and the height of the barometer in the tube being observed, all the necessary data are obtained.

Let m = weight of substance in grammes;

V = volume (in c.c.) occupied by vapour at temperature t ;

h = height of mercury in tube above mercury in reservoir;

b = height of barometer in room.

Then $b - h$ = pressure upon vapour.

Let H = weight of V c.c. of hydrogen at a pressure $b - h$ and temperature t .

Then the vapour-density (d) referred to hydrogen is

$$d = \frac{m}{H}$$

For exact determinations at high temperatures the tension of every vapour (c) at the temperature (t) must be allowed for, and the pressure upon the vapour then becomes $b - h - c$.

In some cases the substance of which the molecular formula is to be determined does not admit of vaporization being decomposed by heat. With such substances, method other than the determination of the vapour-density must consequently be resorted to. In the case of acids and basic compounds, the problem admits of easy solution. Thus, supposing we desired to determine the molecular weight of acetic acid without having recourse to a vapour-density determination. Having ascertained that the acid contains one atom of hydrogen replaceable by metal in other words, that it is monobasic, the silver salt is prepared, and the amount of silver determined. All the necessary data are then obtained. Thus, supposing analysis to give 64.67 per cent. of metal, the molecular weight of the salt, i.e., the weight containing one atom of silver, will be given by the proportion—

$$64.67 : 100 :: 108 : x.$$

Whence

$$x = 167.$$

The weight of the "acid-radicle" is therefore

$$167 - 108 = 59.$$

And as one atom of H is replaced by the Ag, the molecular weight of the acid is 60.

The empirical formula deduced from the analysis would be $\text{CH}_2\text{O} = 30$, so that the molecular formula is $2(\text{CH}_2\text{O}) = \text{C}_2\text{H}_4\text{O}_2$.

With polybasic acids the problem is somewhat complex, but the solution is effected in a similar manner, i.e., by estimating the metal in a normal salt. Silver salts are employed when obtainable, as they are generally anhydrous and easily purified by crystallization.

As a further illustration we now give an example of the determination of the molecular weight of a basic substance. Supposing analysis of the base triethylamine to have given the following results:—

Carbon,.....	71.29
Hydrogen,.....	14.85
Nitrogen,.....	13.86
	100.00

The base is monacid, forming a hydrochloride containing one molecule of HCl, and this hydrochloride forms a double platinum salt containing two molecules of the hydrochloride to one molecule of platinum; 100 parts of the platinum salt left, on ignition, leave 32.14 parts of platinum, so that, to find out the amount of salt containing one atom of platinum, we have—

$$32.14 : 197.5 :: 100 : x$$

$$\therefore x = 614.5.$$

Putting x for the unknown molecular weight of the base, the molecular weight of the salt is—

$$\begin{aligned} 2\text{HCl} &= 73.0 \\ \text{Pt} &= 197.5 \\ \text{Cl}_2 &= 142.0 \\ \hline 2x + 412.5 &= \end{aligned}$$

It was shown by analysis that 197.5 parts of platinum represented 614.5 parts of the double salt, so that—

$$2x + 412.5 = 614.5 \\ \therefore x = 101.$$

Making use of the percentage numbers given by ultimate analysis, we have the following obvious proportions for finding the weights of the respective elements contained in this molecular weight:—

$$\begin{aligned} 100 : 101 &:: 71.29 : C \\ 100 : 101 &:: 14.85 : H \\ 100 : 101 &:: 13.86 : N \end{aligned}$$

Whence $C = 72.0$, $H = 14.9$, $N = 13.9$, and the numbers of the atoms are:—

$$C = \frac{72.0}{12} = 6, H = \frac{14.9}{1} = 14.9, N = \frac{13.9}{14} = 0.99.$$

By the atomic theory these numbers must be integral, so that the numbers of atoms are 6, 15, and 1; and the molecular formula is $C_6H_{15}N$.

When a base does not readily form double platinum salts, the molecular formula is deduced from the analysis of an anhydrous normal salt. In the case of compounds which are neither acid nor basic, and which do not admit of vaporization, the molecular formula can only be indirectly arrived at by considering the chemical transformations of the compound and its relationship to known substances. A molecular formula obtained by this means implies that, could the substance be vaporized, its molecular volume would correspond to the molecular volume of hydrogen.

Rational, Constitutional, or Structural Formulae.—The molecular formula of an organic compound simply expresses the fact that the molecule of such compound contains so many atoms of each of its constituent elements, and in the earlier stages of the science chemists were contented with such representation of their analytical results. As the science developed, however, it soon became evident that substances might have the same percentage composition, or even the same molecular formula, and yet exhibit under the influence of the same reagents totally distinct characters. These facts, which will be more fully discussed in a subsequent part of this article, led to the necessity of devising some method by which organic formulae could be made to represent the behaviour of the respective compounds under the influence of decomposing agents—in other words, the manner in which the compound was capable of splitting up or of being resolved, and, as a necessary result, the converse fact of representing the manner in which the elements of a compound were grouped together. These *rational, constitutional, or structural formulae* must be regarded solely from a chemical point of view; they are symbolic representations of chemical facts, and in no way represent the physical grouping of the atoms in space. They may be most conveniently defined as artificial epitomes of the reactions of compounds, indicating that when decomposed the compounds separate into such and such groups, and that when it is possible to bring these groups or radicles together, the compound can in most cases be built up or synthesized.

Let us now, by way of illustration, proceed to consider the method of arriving at the constitutional formula of some typical compound.

The molecular formula of acetic acid, as previously shown by its ultimate analysis and the determination of silver in its silver salt, is—

Being a monobasic acid, one of its hydrogen atoms is replaceable by metals. This fact is expressed, as in the case of inorganic acids, by the formula—

But this formula does not express the whole of the decompositions possible to the acid; the residue $C_2H_3O_2$ being capable of further subdivision, the formula may be

further developed. Thus, acetic acid may be formed by the action of acetyl chloride upon water, according to the reaction—

Thus the radicle *acetyl* C_2H_3O is shown to enter into the composition of acetic acid, and the formula therefore becomes—

In confirmation of this formula several reactions might be mentioned in which the acetyl group is left unchanged, while the hydroxyl, HO , is withdrawn and replaced by other elements or radicles. For example—

Next with respect to acetyl itself. When acetic acid is electrolyzed, hydrogen is evolved at the positive pole and carbon dioxide and ethane (C_2H_6) at the negative. Now, ethane can be shown to be identical with di-methyl (CH_3)₂, so that the radicle methyl is thus shown to exist in acetic acid—a fact which receives confirmation from several reactions, two of which may be now considered.

When potassium cyanide acts upon methyl iodide, a substance known as *acetonitrile* ($CH_3.CN$) is produced—

By heating acetonitrile with water or caustic potash solution, acetic acid and ammonia are formed, thus—

When barium acetate is submitted to dry distillation it decomposes in the manner shown by the following equation:—

Thus the most developed formula of acetic acid $CH_3.CO.O.H$, or, as it is more conveniently expressed—

The bracket signifies that the two carbon atoms are directly united.

Graphic Formulae.—Graphic formulae having already been explained (see p. 473), it is here only necessary illustrate their application to organic compounds. The following are typical examples:—

Name of Compound.	Rational Formula	Graphic Formula.
Acetic acid.	$\left\{ \begin{array}{l} CH_3 \\ COOH \end{array} \right.$	$\begin{array}{c} H \\ \\ H-C-H \\ \\ O=C-O-H \end{array}$
Triethylamine.	$N \left\{ \begin{array}{l} C_2H_5 \\ C_2H_5 \\ C_2H_5 \end{array} \right.$	$\begin{array}{c} H \\ \\ H-C-H \\ \\ H-C-H \\ \\ H-C-H \\ \quad \quad \quad \\ H \quad H \quad H \quad H \end{array}$

The globe, after being cleaned and allowed to cool, is again weighed, the temperature and height of the barometer being at the same time observed. The capacity of the globe is measured by breaking the point of the neck under mercury, when the metal rushes in to supply the place of the condensed vapour. As the expulsion of air by the escaping vapour is seldom complete, there usually remains a bubble of residual air, which must be allowed for by running in a known quantity of mercury from a burette. The total quantity of mercury is then poured out and its volume measured. The calculation is made from these data by the following approximative method:—

Let m = weight of globe + air at the temperature t of weighing and height of barometer b ;
 m' = weight of globe + vapour at the temperature t' of sealing and height of barometer b' ;
 V = capacity of globe in cubic centimetres;
 λ = weight of V cubic centimetres of air at t and b .
 Then $m - \lambda$ = weight of vacuum globe;
 $m' - (m - \lambda)$ = weight of substance.
 Let H = wt. of V c.c. of hydrogen at t' and b' , then the vapour-density (d) referred to hydrogen is

$$d = \frac{m' - (m - \lambda)}{H}.$$

When residual air (r) is found in the globe, $V - r$ = capacity of globe.

In very exact determinations corrections must be made for (1) the expansion of glass, (2) the difference of temperature and pressure between the first and second weighings of the globe, and (3) the difference in density between the drop of fluid remaining in the globe and the density of mercury. For most chemical purposes, however, the above-given approximation formula is sufficiently accurate.

For high temperatures the globe is immersed in the vapours of boiling mercury, cadmium, or zinc, and the apparatus is modified accordingly.

Gay-Lussac and Hofmann's Methods.—These methods have for their object the measurement of the volume of a known weight of vapour. Gay-Lussac's method, being available only for substances boiling below 100°C ., has been gradually replaced by Hofmann's modification (fig. 9).

A glass tube about 1 metre in length and 20 mm. diameter, closed at one end, is graduated and calibrated. The tube being filled with mercury, and inverted in a vessel of the same liquid, is practically a barometer with an exaggerated Torricellian vacuum. Surrounding this tube is a wider tube, through which the vapour of any liquid boiling at a constant temperature can be passed, and thus the barometer tube and its contents kept at that temperature.

The substance of which the vapour-density is to be determined is weighed (about $\frac{1}{10}$ gram.) in a minute stoppered bottle, and passed up into the Torricellian vacuum. According to the boiling-point of the substance (which is, of course, much lowered by the reduced pressure), the vapour of alcohol, water, aniline, or amyl alcohol is passed through the space between the

FIG. 9. Hofmann's Vapour-density Apparatus.

AA, graduated barometer tube standing in funnel; h, height of mercury column; BB, outer glass cylinder enclosing barometer tube; t, tube by which hot vapour is introduced; t', tube by which hot vapour and overflow of mercury escape; t is connected with the flask of boiling liquid, and t' with a condenser.

two tubes till the temperature and volume of vapour remain constant. The height of the mercury column, the temperature to which the vapour is heated, and the height of the barometer in the room being observed, all the necessary data are obtained.

Let m = weight of substance in grammes;
 V = volume (in c.c.) occupied by vapour at temperature t ;
 h = height of mercury in tube above mercury in reservoir;
 b = height of barometer in room.
 Then $b - h$ = pressure upon vapour.
 Let H = weight of V c.c. of hydrogen at a pressure $b - h$ and temperature t .

Then the vapour-density (d) referred to hydrogen is

$$d = \frac{m}{H}.$$

For exact determinations at high temperatures the tension of mercury vapour (c) at the temperature (t) must be allowed for, and the pressure upon the vapour then becomes $b - h - c$.

In some cases the substance of which the molecular formula is to be determined does not admit of vaporization being decomposed by heat. With such substances, some method other than the determination of the vapour-density must consequently be resorted to. In the case of acid or basic compounds, the problem admits of easy solution. Thus, supposing we desired to determine the molecular weight of acetic acid without having recourse to a vapour density determination. Having ascertained that the acid contains one atom of hydrogen replaceable by metals, or in other words, that it is monobasic, the silver salt is prepared, and the amount of silver determined. All the necessary data are then obtained. Thus, supposing the analysis to give 64.67 per cent. of metal, the molecular weight of the salt, i.e., the weight containing one atom of silver, will be given by the proportion—

$$64.67 : 100 :: 108 : x.$$

Whence

$$x = 167.$$

The weight of the "acid-radicle" is therefore

$$167 - 108 = 59.$$

And as one atom of H is replaced by the Ag, the molecular weight of the acid is 60.

The empirical formula deduced from the ultimate analysis would be $\text{CH}_2\text{O} = 30$, so that the molecular formula is $2(\text{CH}_2\text{O}) = \text{C}_2\text{H}_4\text{O}_2$.

With polybasic acids the problem is somewhat more complex, but the solution is effected in a similar manner, i.e., by estimating the metal in a normal salt. Silver salts are employed when obtainable, as they are generally anhydrous and easily purified by crystallization.

As a further illustration we now give an example of the determination of the molecular weight of a basic substance. Supposing: analysis of the base triethylamine to have given the following results:—

Carbon,.....	71.29
Hydrogen,.....	14.85
Nitrogen,.....	13.86
	100.00

The base is monacid, forming a hydrochloride containing one molecule of HCl, and this hydrochloride forms a double platinum salt containing two molecules of the hydrochloride to one molecule of platinum; 100 parts of the platinum salt left, on ignition, 32.14 parts of platinum, so that, to find out the amount of salt containing one atom of platinum, we have—

$$32.14 : 197.5 :: 100 : x$$

$$\therefore x = 614.5.$$

Putting x for the unknown molecular weight of the base, the molecular weight of the salt is—

$$\begin{aligned} 2\text{HCl} &= 73.0 \\ \text{Pt} &= 197.5 \\ \text{Cl}_2 &= 142.0 \\ \hline 2x + 412.5 \end{aligned}$$

It was shown by analysis that 197.5 parts of platinum represented 614.5 parts of the double salt, so that—

$$2x + 412.5 = 614.5 \\ \therefore x = 101.$$

Making use of the percentage numbers given by ultimate analysis, we have the following obvious proportions for finding the weights of the respective elements contained in this molecular weight:—

$$\begin{aligned} 100 : 101 &:: 71.29 : C \\ 100 : 101 &:: 14.85 : H \\ 100 : 101 &:: 13.86 : N \end{aligned}$$

Whence $C = 72.0$, $H = 14.9$, $N = 13.9$, and the numbers of the atoms are:—

$$C = \frac{72.0}{12} = 6, H = \frac{14.9}{1} = 14.9, N = \frac{13.9}{14} = 0.99.$$

By the atomic theory these numbers must be integral, so that the numbers of atoms are 6, 15, and 1; and the molecular formula is $C_6H_{15}N$.

When a base does not readily form double platinum salts, the molecular formula is deduced from the analysis of an anhydrous normal salt. In the case of compounds which are neither acid nor basic, and which do not admit of vaporization, the molecular formula can only be indirectly arrived at by considering the chemical transformations of the compound and its relationship to known substances. A molecular formula obtained by this means implies that, could the substance be vaporized, its molecular volume would correspond to the molecular volume of hydrogen.

Rational, Constitutional, or Structural Formulae.—The molecular formula of an organic compound simply expresses the fact that the molecule of such compound contains so many atoms of each of its constituent elements, and in the earlier stages of the science chemists were contented with such representation of their analytical results. As the science developed, however, it soon became evident that substances might have the same percentage composition, or even the same molecular formula, and yet exhibit under the influence of the same reagents totally distinct characters. These facts, which will be more fully discussed in a subsequent part of this article, led to the necessity of devising some method by which organic formulæ could be made to represent the behaviour of the respective compounds under the influence of decomposing agents—in other words, the manner in which the compound was capable of splitting up or of being resolved, and, as a necessary result, the converse fact of representing the manner in which the elements of a compound were grouped together. These *rational, constitutional, or structural* formulæ must be regarded solely from a chemical point of view; they are symbolic representations of chemical facts, and in no way represent the physical grouping of the atoms in space. They may be most conveniently defined as artificial epitomes of the reactions of compounds, indicating that when decomposed the compounds separate into such and such groups, and that when it is possible to bring these groups or radicals together, the compound can in most cases be built up or synthesized.

Let us now, by way of illustration, proceed to consider the method of arriving at the constitutional formula of some typical compound.

The molecular formula of acetic acid, as previously shown by its ultimate analysis and the determination of silver in its silver salt, is—

Being a monobasic acid, one of its hydrogen atoms is replaceable by metals. This fact is expressed, as in the case of inorganic acids, by the formula—

But this formula does not express the whole of the decompositions possible to the acid; the residue $C_2H_3O_2$ being capable of further subdivision, the formula may be

further developed. Thus, acetic acid may be formed by the action of acetyl chloride upon water, according to the reaction—

Thus the radicle *acetyl* C_2H_3O is shown to enter into the composition of acetic acid, and the formula therefore becomes—

In confirmation of this formula several reactions might be mentioned in which the acetyl group is left unchanged, while the hydroxyl, HO , is withdrawn and replaced by other elements or radicals. For example—

Next with respect to acetyl itself. When acetic acid is electrolyzed, hydrogen is evolved at the positive pole and carbon dioxide and ethane (C_2H_6) at the negative. Now, ethane can be shown to be identical with di-methyl (CH_3), so that the radicle methyl is thus shown to exist in acetic acid—a fact which receives confirmation from several reactions, two of which may be now considered.

When potassium cyanide acts upon methyl iodide, a substance known as *acetonitrile* ($CH_3.CN$) is produced—

By heating acetonitrile with water or caustic potash solution, acetic acid and ammonia are formed, thus—

When barium acetate is submitted to dry distillation, it decomposes in the manner shown by the following equation:—

Thus the most developed formula of acetic acid is $CH_3.CO.O.H$, or, as it is more conveniently expressed—

The bracket signifies that the two carbon atoms are directly united.

Graphic Formulæ.—Graphic formulæ having already been explained (see p. 473), it is here only necessary to illustrate their application to organic compounds. The following are typical examples:—

Isomerism.—It has been mentioned that organic substances may have the same percentage composition and molecular formula, and yet exhibit totally distinct chemical and physical characters. To this phenomenon the general term *isomerism* is applied, and the compounds are termed *isomerides*, or are said to be *isomeric*. The differences between isomeric bodies are well explained on the view that such bodies possess different constitutions, or that their elements are grouped in different ways. Constitutional formulæ are thus absolutely indispensable for the representation of isomerides. As will be seen subsequently, there can be several kinds of isomerism, but we shall here restrict the term to two classes of cases.

(1.) *Isomerism proper or Physical Isomerism.*—In these cases the substances are identical in their composition, vapour-density, and chemical behaviour, but exhibit different physical properties. Thus there are several hydrocarbons known as *terpenes*, having the formula $\text{C}_{10}\text{H}_{16}$, which exist in the oils of turpentine, lemon, bergamot, orange, &c., and which exhibit the same behaviour under the influence of chemical reagents, differing only in their odour and action upon polarized light. Again, the empirical formula $\text{C}_4\text{H}_6\text{O}_3$ includes several organic acids (tartaric acid being one of the number) which are physical isomerides differing from one another only in their crystalline form and action upon polarized light.

(2.) *Chemical Isomerism.*—In these cases the compounds are identical in composition and in their molecular formulæ, but differ in physical properties and chemical behaviour in certain reactions.

For instance, by taking one atom of hydrogen from the hydrocarbon propane (C_3H_8) we obtain the radicle propyl (C_3H_7), and if we suppose one atom of hydrogen in marsh gas or methane (CH_4) to be replaced by propyl, we get the hydrocarbon tetraene or diethyl—

Now propyl can be written in two different ways, according as the elements are grouped differently; thus—

The differences are still more strikingly shown by the use of graphic formulæ—

Distinguishing these radicles from each other by the names propyl and pseudopropyl, it is clear that we can have a tetraene containing propyl and another containing pseudopropyl—

These formulæ can, of course, be written in a more condensed form; thus—

or

The graphic formulæ help to show still more clearly that the elements can be grouped only in two different ways—

The fact thus shown possible by formulation is borne out experimentally. Two tetraenes actually exist,—one, which from its mode of formation can be shown to be propyl-methane or diethyl, having a boiling point of 1°C ., the other, which can be shown to be pseudopropyl-methane, boiling at -15°C .

The experimental confirmation does not, however, end here. The same isomerism can be shown to exist among all the derivatives of these two propyla. Thus we have—

NORMAL SERIES.				ISOMERIC SERIES.			
Name of Compound.	Formula.	Boiling point.	Specific gravity.	Name of Compound.	Formula.	Boiling point.	Specific gravity.
Hexane or dipropyl	$\text{C}_3\text{H}_7\cdot\text{C}_3\text{H}_7$	70°	$\cdot669$ at 16°	Di-pseudopropyl	$\begin{cases} \text{CH}(\text{CH}_3)_2 \\ \text{CH}(\text{CH}_3)_2 \end{cases}$	58°	$\cdot67$ at 17°
Propyl chloride or chloropropane	$\text{C}_3\text{H}_7\text{Cl}$	$46\cdot5^\circ$	$\cdot915$ at 0°	Pseudopropyl chloride	$\text{CH}(\text{CH}_3)_2\text{Cl}$	39°	$\cdot874$ at 10°
Propyl bromide or bromopropane	$\text{C}_3\text{H}_7\text{Br}$	71°	$1\cdot35$ at 16°	Pseudopropyl bromide	$\text{CH}(\text{CH}_3)_2\text{Br}$	61°	$1\cdot32$ at 13°
Propyl iodide or iodopropane	$\text{C}_3\text{H}_7\text{I}$	102°	$1\cdot76$ at 16°	Pseudopropyl iodide	$\text{CH}(\text{CH}_3)_2\text{I}$	$89\cdot5^\circ$	$1\cdot70$ at 15°
Propyl alcohol or ethyl carbinol	$\text{C}_3\text{H}_7\cdot\text{OH}$	$97\cdot4^\circ$	$\cdot806$ at 15°	Pseudopropyl alcohol or dimethyl carbinol	$\text{CH}(\text{CH}_3)_2\cdot\text{OH}$	$82\cdot85^\circ$	$\cdot786$ at 16°
Propylamine or amidopropane	$\text{C}_3\text{H}_7\cdot\text{NH}_2$	$49\cdot5^\circ$	$\cdot728$ at 0°	Pseudopropylamine	$\text{CH}(\text{CH}_3)_2\cdot\text{NH}_2$	32°	$\cdot69$ at 18°
Butyric acid	$\text{C}_3\text{H}_7\cdot\text{COOH}$	$162\cdot5^\circ$	$\cdot982$ at 0°	Pseudobutyric acid	$\text{CH}(\text{CH}_3)_2\cdot\text{COOH}$	154°	$\cdot959$ at 0°

Thus every additional atom of carbon brings two acti

units of atomicity into the molecule, and if we suppose these carbon atoms to be saturated by hydrogen, we shall have an ascending series of hydrocarbons, each member of which differs from the one beneath it by $+CH_2$. Such series are known as *homologous series*. The following are examples:—

CH_4 , Methane.	CH_4O , Methylalcohol.	CH_2O_2 , Formic acid.
C_2H_6 , Ethane.	C_2H_5O , Ethyl "	$C_2H_3O_2$, Acetic "
C_3H_8 , Propane.	C_3H_7O , Propyl "	$C_3H_5O_2$, Propionic "
C_4H_{10} , Tetraene.	C_4H_9O , Butyl "	$C_4H_7O_2$, Butyric "
C_5H_{12} , Pentane.	$C_5H_{11}O$, Amyl "	$C_5H_9O_2$, Valeric "
C_nH_{2n+2}	$C_nH_{2n+2}O$	$C_nH_{2n+2}O_2$

Isologous Series.—An inspection of the foregoing formulae will show that hydrocarbons of the general formula C_nH_{2n+2} are the only *saturated* compounds, i.e., the only compounds in which the atom-fixing powers of the carbon atoms are completely satisfied. If an odd number of hydrogen atoms be withdrawn, a compound having a certain odd number of unsatisfied units of atomicity (i.e., a "perissad" radicle) is the result, and such compounds are incapable of existing in the free state. From this and previous considerations it follows, that "all hydrocarbons contain an even number of atoms of hydrogen," and further, "that the sum of the atoms of monad and triad elements contained in the molecule of a carbon compound must also always be an even number" (Schorlemmer).

Compounds containing an even number of unsatisfied units of atomicity, although non-saturated, are capable of existing in the free state. Thus, commencing with the saturated hydrocarbons of the C_nH_{2n+2} series, hydrogen atoms can be withdrawn by pairs, giving rise to a descending series of hydrocarbons, each member of which differs from the one below it by $+H_2$. Such series are termed *isologous series*. The following table shows at a glance the relationship between homologous and isologous series, and at the same time the system of nomenclature used:—

Isologous Series.		Isologous Series.		Isologous Series.		Isologous Series.	
Name of Compound.	Formula.	Name of Compound.	Formula.	Name of Compound.	Formula.	Name of Compound.	Formula.
Methane	CH_4	Ethane	C_2H_6	Propane	C_3H_8	Butane	C_4H_{10}
Methene	CH_2	Ethene	C_2H_4	Propene	C_3H_6	Butene	C_4H_8
		Ethine	C_2H_2	Propine	C_3H_4	Butine	C_4H_6
				Propone	C_3H_2	Butone	C_4H_4
						Butone	C_4H_2

Organic Radicles.—The meaning of the term *radicle* has already been explained (p. 474), so that it is here only necessary to point out the part played by such unsaturated groups of atoms in the formation of organic compounds.

It has already been mentioned that an odd number of hydrogen atoms withdrawn from a saturated hydrocarbon of the C_nH_{2n+2} series leaves an unsaturated group having an odd number¹ of unsatisfied units of atomicity. For example:—

Thus the C_nH_{2n+2} hydrocarbons may be conveniently regarded for some purposes as hydrides of C_nH_{2n+1} radicles, a series the members of which enter largely into the composition of organic compounds of all classes.

Perissad radicles are incapable of existing in the free state because on isolation two semi-molecules unite; for instance—

¹ The names of perissad radicles are made to end in *yl*.

$$\text{Generally } 2(C_nH_{2n+1}) = C_{2n}H_{4n+2}.$$

It is by no means necessary that a group of atoms should be capable of isolation in order to constitute such group an organic radicle. Any unsaturated group which through several reactions remains unchanged may be so regarded.² (See, for example, the previously quoted reactions of acetic acid.)

The following are additional examples of organic radicles:—

Cyanogen $N \equiv C$ —; in the free state, $N \equiv C - C \equiv N$.

Acetyl $(C_2H_3O)' = CO < CH_3$.

Carboxyl $(COOH)'$; in the free state, oxalic acid, $\begin{array}{c} COOH \\ | \\ COOH \end{array}$

While hydrocarbon radicles are positive (see p. 476), cyanogen and the oxygen-containing or acid radicles are negative.

Fatty and Aromatic Groups.—In order to assist in bringing the vast numbers of organic compounds within the scope of some system of classification, chemists frequently adopt the convenient division of them into fatty and aromatic groups.

It will be seen subsequently that most organic compounds may be regarded as derived by substitution from hydrocarbons.³ Starting, then, with the saturated hydrocarbons C_nH_{2n+2} , the isologous series, down to C_nH_{2n-6} , and some of the members of the C_nH_{2n-4} series, with their derivatives, constitute the fatty group, so called because many of its members exist in fatty bodies. The hydrocarbons of the C_nH_{2n-6} , &c., series, with their derivatives, are termed the aromatic group, because many of the compounds are obtained from balsams, essential oils, gums, resins, and other aromatic substances. The chief characteristic of the aromatic group is the comparative stability of its compounds, for, whereas the artriad (i.e., even) radicles of the fatty group act as unsaturated groups entering freely into direct combination with other elements, the aromatic radicles act more like saturated groups entering into direct combination only with difficulty, and forming substitution compounds with comparative ease.

The division here made between fatty and aromatic substances must not be regarded as one having a sharply defined boundary line. In point of fact, the two series merge into one another, and compounds belonging to one group can be transformed into compounds of the other. Thus benzene, the typical hydrocarbon of the aromatic group, can be formed directly from ethine or acetylene, a hydrocarbon of the fatty group, by the polymerization effected by heat:—

Also acetone, a substance directly obtainable from the

² So numerous, indeed, are these radicles in Organic Chemistry that this branch of the science has been named the "Chemistry of compound radicles."

³ "We may therefore define that part of our science which is generally known as Organic Chemistry as the Chemistry of the Hydrocarbons and their Derivatives."—Schorlemmer.

salts of the fatty body acetic acid, when it is heated with sulphuric acid, loses water and is transformed into mesitylene or trimethylbenzene:—

Families of Organic Compounds.—Most of the organic compounds at present known can be referred to certain families which we shall now proceed to enumerate.

I. Hydrocarbons.—These are the parent bodies from which the remaining families are derived. Their arrangement into homologous and isologous series has already been discussed.

II. Alcohols.—Formed from hydrocarbons by the substitution of hydroxyl for hydrogen:—

III. Haloid Ethers.—Formed from hydrocarbons by the substitution of halogen elements for hydrogen:—

IV. Ethers.—Derived from alcohols by the substitution of oxygen for hydroxyl; thus, from

we have

V. Sulphur, Selenium, and Tellurium Alcohols and Ethers.—These compounds are the analogues of the alcohols and ethers, oxygen being replaced by sulphur, &c. The thio-alcohols are known as *mercaptans*:—

VI. Aldehydes.—Derived from hydrocarbons by the replacement of hydrogen by the radicle (COH):—

VII. Ketones.—Derived from aldehydes by the replacement of hydrogen in the COH group by monad hydrocarbon radicles:—

VIII. Organic Acids.—These compounds may be regarded as hydrocarbons in which hydrogen is replaced by carboxyl:—

The organic acids may likewise be regarded as derived from alcohols by the replacement of H_2 by O:—

Corresponding thio-acids are known thus:—

IX. Anhydrides.—Derived from acids by the substitution of oxygen for hydroxyl, and thus bearing the same

relationship to the acids that the ethers bear to the alcohols; thus, from

we have

Corresponding thio-compounds are capable of existing:—

X. Acid Halides.—Derived from acids by the substitution of halogen elements for hydroxyl. These compounds are thus most conveniently formulated as compounds of an oxygenated or acid radicle¹ with the halogens:—

XI. Ethereal Salts or Compound Ethers.—Derived from acids, organic or inorganic, by the substitution of a hydrocarbon radicle for the hydrogen of the hydroxyl:—

The thio-acids also form ethereal salts:—

XII. Organo-metallic Bodies.—Compounds of hydrocarbon radicles with metals:—

XIII. Amines or Compound Ammonias.—These compounds are most conveniently regarded as derivatives of ammonia and its hydrate, and of ammonium haloid salts, hydrogen being replaced by hydrocarbon radicles:—

These compounds may likewise be formulated as hydrocarbon derivatives:—

The phosphorus, arsenic, antimony, and bismuth analogues of ammonia yield derivatives corresponding to the amines:—

¹ The names of all acid radicles, perissad and artiad (i.e., odd and even), end in yl.

XIV. *Amides*.—These compounds are analogous to the amines, being derived from ammonia by the substitution of acid radicles for hydrogen :—

The amides may also be written as compounds of acid radicles with amidogen $(\text{NH}_2)'$, imidogen $(\text{NH})''$, and nitrogen N''' :—

The fourteen families now enumerated, although comprising most of the known organic substances, still leave outstanding a large number of compounds, of which the constitution has not yet been determined, and which consequently cannot be referred to any of the above groups. We propose to consider briefly the individual families in succession, describing the mode of preparation and properties of the most important members of each family, and then proceeding to the consideration of the unclassified organic compounds.

CYANOGEN AND ITS COMPOUNDS.

The compound which in its chemical behaviour most closely resembles inorganic substances, and which forms as it were a connecting link between these and organic bodies, is the radicle cyanogen. Before proceeding, therefore, to the systematic consideration of the great organic families, cyanogen and its compounds may be conveniently treated of.

Cyanogen,¹ CN or Cy, in the free state Cy_2 , is generally prepared by heating the cyanide of some heavy metal (usually mercury) : $\text{HgCy}_2 = \text{Hg} + \text{Cy}_2$. A brown substance, most probably a polymeride of cyanogen, known as *paracyanogen*, is always formed in this reaction.

Cyanogen is a colourless gas, having a pungent odour resembling that of bitter almond oil. It burns in air with a deep purple flame, and is extremely poisonous. The gas is condensable into a liquid under a pressure of about 4 atmospheres. The liquid boils at -21°C , and solidifies at -34°C . Water absorbs about 4 volumes of the gas in the cold. The aqueous solution decomposes on standing, ammonium oxalate being the chief product of the reaction : $\text{C}_2\text{N}_2 + 4\text{OH}_2 = (\text{NH}_4)_2\text{C}_2\text{O}_4$. At the same time small quantities of urea, ammonium carbonate, and cyanide are formed. The addition of a mineral acid to the solution greatly retards the decomposition, oxamide being then produced : $\text{C}_2\text{N}_2 + 2\text{OH}_2 = \text{C}_2\text{O}_2(\text{NH}_2)_2$. Conversely, when oxamide or ammonium oxalate is heated, cyanogen is produced : $(\text{NH}_4)_2\text{C}_2\text{O}_4 - 4\text{OH}_2 = \text{C}_2\text{N}_2$; $\text{C}_2\text{O}_2(\text{NH}_2)_2 - 2\text{OH}_2 = \text{C}_2\text{N}_2$.

¹ From *κυανός*, blue, because of the colour of many of its compounds.

In its chemical relationships cyanogen is the exact analogue of the halogen elements. Its compounds with metals or positive radicles are called *cyanides*.

Compounds of cyanogen with Cl, Br, I, S, OH, and NH_2 are known, and are remarkable for their polymeric modifications. The following is a list of the more important compounds :—

Cyanogen chloride, CNCl	Cyanic acid, CNOH
Cyanuric chloride, $\text{C}_3\text{N}_3\text{Cl}_3$	Cyanuric acid, $\text{C}_3\text{N}_3\text{O}_3\text{H}_3$
Cyanogen bromide, CNBr	Sulphocyanic acid, CNSH
Cyanuric bromide, $\text{C}_3\text{N}_3\text{Br}_3$	Cyanamide, $\text{CN}(\text{NH}_2)$
Cyanogen iodide, CNI	Dicyanamide, $\text{C}_2\text{N}_2(\text{NH}_2)$
Cyanogen sulphide, $\text{C}_2\text{N}_2\text{S}$	Cyanuric amide, $\text{C}_3\text{N}_3(\text{NH}_2)_3$
Cyanogen selenide, $\text{C}_2\text{N}_2\text{Se}$	Ammelide, $\text{C}_3\text{N}_3(\text{NH}_2)(\text{OH})$
	Ammeline, $\text{C}_3\text{N}_3(\text{NH}_2)_2\text{OH}$

Hydrogen Cyanide, or *Hydrocyanic* or *Prussic Acid*, HCN or HCy .—This compound is formed synthetically by passing electric sparks through a mixture of nitrogen and ethine gases : $\text{C}_2\text{H}_2 + \text{N}_2 = 2\text{HCN}$. In practice benzene vapour may be used instead of pure ethine, as it is partially resolved into the latter substance by the action of the spark. The anhydrous acid is also obtained by passing dry hydrogen sulphide over mercuric cyanide. The aqueous solution of the acid is prepared by the action of acids upon metallic cyanides : $\text{HCl} + \text{KCN} = \text{KCl} + \text{HCN}$; by the action of ammonia on chloroform : $\text{NH}_3 + \text{CHCl}_3 = \text{HCN} + 3\text{HCl}$; and also (most conveniently) by heating a mixture of 5 parts of potassium ferrocyanide with 3 parts of sulphuric acid and 4 parts of water.

The pure acid is a colourless liquid, having an odour of bitter almonds; it is a most violent poison. Its boiling-point is 26.5°C and its point of solidification -15°C . The pure acid and its strong aqueous solution are both inflammable, burning in air with a violet flame. Both the anhydrous and aqueous acids are very unstable, the former decomposing into ammonia and a brown substance, and the latter undergoing the same decomposition with the additional formation of ammonium formate. Small quantities of formic or of a mineral acid prevent this decomposition, but on mixture with strong acids, a complete decomposition into formic acid ensues :—

Alkalies induce a similar change, alkaline formate and free ammonia being produced. When ammonium formate is heated, the inverse reaction takes place :—

A polymeride, $\text{H}_3\text{C}_3\text{N}_3$, is known.

Metallic Cyanides.—Cyanogen being a monad radicle forms, like Cl, Br, and I, a series of salts typified by the formulæ $\text{M}'\text{Cy}$, $\text{M}''\text{Cy}_2$, $\text{M}'''_2\text{Cy}_3$, $\text{M}'''\text{Cy}_4$. Of these the most important is potassium cyanide, which can be formed by passing nitrogen over a mixture of red hot carbon and potassium carbonate :—

This salt is also produced by heating potassium ferrocyanide either alone or mixed with potassium carbonate. Most of the metallic cyanides can be prepared by the action of hydrocyanic acid upon the oxides and hydroxides of the metals, or by double decomposition.

The cyanides have a remarkable tendency to form double salts, such, for example, as the double cyanide of potassium and silver, $\text{KCy}.\text{AgCy}$.

Of these double cyanides a certain number are decomposed by the action of a mineral acid yielding free HCy and salts of the acid :—

I. HYDROCARBONS.

Starting with the saturated compounds of the C_nH_{2n+2} series, the isologous series C_nH_{2n} , C_nH_{2n-2} , C_nH_{2n-32} are known.

First Series, C_nH_{2n+2} .—Marsh Gas or Paraffin Series.

The first member of the series is CH_4 (marsh gas or methane), and the homologues down to $C_{18}H_{38}$ (hexadecane) have been obtained. The names and formulæ will be given later on.

General Properties.—The members of the series exhibit a regular gradation in physical properties with each successive addition of CH_2 . Thus, the first four members are gaseous at ordinary temperatures, while the succeeding terms are liquids of increasing specific gravity and viscosity as the series is ascended; those containing 20 or more carbon atoms are solid crystalline bodies. The boiling-point increases as the series is ascended, the difference between the boiling-points of the successive terms of the normal series decreasing regularly by about $4^\circ C.$ as far as $C_{12}H_{26}$, after which there appears to be a constant difference of $19^\circ C.$

The paraffins are chemically distinguished for their in-difference, hence the name applied to the series (*parum affinis*). Being saturated molecules, they are incapable of uniting directly with any other element or radicle. The halogen elements produce by their action on paraffins substitution derivatives (haloid ethers), in which the hydrogen of the hydrocarbon is replaced by the halogen.

These compounds will be again referred to under the family of the haloid ethers. Sulphuric acid is without action on paraffins, and at ordinary temperatures they are scarcely attacked by oxidizing agents; but on heating with these agents they are either entirely oxidized to CO_2 and OH_2 , or, in addition, to acids of the acetic ($C_nH_{2n+1}COOH$) and succinic [$C_nH_{2n}(COOH)_2$] series. Nitric acid exerts no action in the cold, but the concentrated acid attacks the higher members of the series when heated with them, forming nitro-substitution compounds in which hydrogen is replaced by nitryl (NO_2), and, in some instances, acids of the acetic and succinic series and nitriles. The lower members of the series are not acted on by nitric acid, but their nitro-derivatives can be obtained by indirect methods, the general method of preparation being the action of silver nitrite on the iodo-paraffin:—

These nitro-paraffins are interesting as being metameric with the corresponding ethereal salts of nitrous acid; thus—

Generally—

In accordance with the above formulation the two classes of compounds are differently acted on by nascent hydrogen.

The higher members of the series are resolved by prolonged heating in sealed tubes into members lower in the series and members of the isologous series, C_nH_{2n} (olefines), in accordance with the general equation—

Occurrence of Paraffins.—Methane, or marsh gas, is an invariable product of the decomposition of organic matter excluded from the air, and is thus produced at the bottom of stagnant ponds, marshes, &c. This gas is the “fire-damp” of coal mines; it is found in volcanic gases, and the gas issuing from a mud volcano in the Crimea is almost pure methane. The normal paraffins are found in coal formations and other bituminous strata. Thus, American petroleum contains a mixture of all the paraffins from marsh gas to pentadecane ($C_{15}H_{32}$), or even higher members. In boring for rock oil large quantities of methane escape, and from the freshly drawn petroleum ethane and propane are given off as gases at the ordinary temperature of the air. On distilling off the liquid portion (known commercially as “paraffin oil”) the higher members of the series remain as white crystalline solids. Many paraffins occur also in the oil obtained by the destructive distillation of Boghead and cannel coal. Solid paraffins are likewise formed in the destructive distillation of wood, coal, bituminous shale, &c., and are found native, as *fossil wax*, *ozokerite*, *hatchetin*, &c.

General Methods of Formation of Paraffins.

1. By the action of nascent hydrogen upon haloid ethers of C_nH_{2n+1} radicles—

2. By the action of zinc and water upon the iodides of C_nH_{2n+1} radicles—

3. By the action of water upon the organo-metallic bodies of the general formula $Zn(C_nH_{2n+1})_2$ —

4. By heating iodides of C_nH_{2n+1} radicles with zinc—

In this reaction the paraffin is, at the same time, resolved into a lower member of the series containing half the number of carbon atoms, and the corresponding isologue of the C_nH_{2n} series—

5. By the action of sodium on the iodides of C_nH_{2n+1} radicles—

6. By the electrolysis of the fatty acids of the series $C_nH_{2n}O_2$ (see ascertic series)—

7. By heating the dry sodium salts of $C_nH_{2n+1} \cdot COOH$ and $C_nH_{2n} \cdot (COOH)_2$ acids with sodium hydroxide—

8. By the dry distillation of acetates and butyrates several paraffins are formed.

9. Almost all organic compounds yield paraffins when heated in sealed tubes to a very high temperature with excess of strong hydriodic acid.

10. Many paraffins have been obtained by acting on a mixture of the corresponding iodides and ethyl alcohol with copper-coated zinc foil (Gladstone and Tribe's “copper-zinc couple”)—

Formulation and Classification of Paraffins.—All the members of the paraffin series can be regarded as methane, in which one atom of hydrogen is replaced by C_nH_{2n+1} radicles; thus—

They may likewise be formulated as hydrides of $\text{C}_n\text{H}_{2n+1}$ radicles, in accordance with their formation from the haloid ethers of these radicles by the action of nascent hydrogen—

More generally, the paraffins may be regarded as formed by the coalescence of any hydrocarbon radicles, furnishing by their addition the necessary number of carbon and hydrogen atoms; thus—

The number of possible methods of representing a paraffin thus greatly increases with the complexity of the molecule, but it must not be inferred from these formulæ that the radicles represented as composing a paraffin molecule have a separate existence in the compound. Such formulation expresses simply the possible modes of formation by which the compound can be produced. For instance—

a. The ethyl hydride obtained by the action of nascent hydrogen upon ethyl iodide ($\text{C}_2\text{H}_5\text{I} + \text{H}_2 = \text{C}_2\text{H}_6 + \text{HI}$) is identical with the ethene hydride produced by the action of nascent hydrogen on an ethene haloid ether ($\text{C}_2\text{H}_4\cdot\text{I}_2 + 2\text{H}_2 = \text{C}_2\text{H}_6 + 2\text{HI}$), and with the dimethyl formed by heating CH_3I with amalgam [$2\text{CH}_3\text{I} + \text{Zn} = (\text{CH}_3)_2 + \text{ZnI}_2$].

β. The propane (propyl hydride) obtained by the action of nascent hydrogen on propyl iodide, &c. ($\text{C}_3\text{H}_7\text{I} + \text{H}_2 = \text{C}_3\text{H}_8 + \text{HI}$), is identical with the ethyl-methyl produced by the action of a metal on a mixture of the iodides of methyl and ethyl ($\text{CH}_3\text{I} + \text{C}_2\text{H}_5\text{I} + \text{Na} = \text{CH}_3\cdot\text{C}_2\text{H}_5 + 2\text{NaI}$), or by the action of zinc-ethyl on methyl iodide [$\text{Zn}(\text{C}_2\text{H}_5)_2 + 2\text{CH}_3\text{I} = 2\text{CH}_3\cdot\text{C}_2\text{H}_5 + \text{ZnI}_2$].

γ. Methane obtained by the action of nascent hydrogen on methyl iodide is identical with the methenyl hydride formed by the action of nascent hydrogen on chloroform ($\text{CH}^{\text{III}}\text{Cl}_3 + 3\text{H}_2 = \text{CH}^{\text{III}}\cdot\text{H}_3 + 3\text{HCl}$).

Thus it must not be supposed that, because ethane may be written as dimethyl, ethane contains methyl. On treating ethane with chlorine, for example, we do not obtain methyl chloride (CH_3Cl), but substitution products of ethane, $\text{C}_2\text{H}_5\text{Cl}$, and similar relations obtain throughout the series.

Turning to the graphic formulæ made use of in illustrating the formation of homologous series by the continuous coalescence of carbon atoms with the consequent increase of atomicity (p. 552), it will be seen that the homologous series of $\text{C}_n\text{H}_{2n+1}$ radicles can be regarded as derived from the first member, methyl, CH_3 , by the continuous addition

of methene, CH_2 ; and as the paraffins can be regarded as derived from the first member, methane, by the substitution of $\text{C}_n\text{H}_{2n+1}$ radicles for hydrogen, we have the following constitutional formulæ for the four first members:—

Thus, with the increase of the number of atoms in the molecule we have an increased number of hydrocarbon radicles coalescing to form the paraffin; in other words, we have increased complexity of structure, and thus the possible modes of arrangement, or the possible number of isomerides (see p. 550), becomes greater as the number of atoms becomes greater. The three first members, as will be seen from the above formulæ, can only be written in the manner shown, and no isomerides exist. The fourth member, butane or tetrane, as already shown, when treating of isomerism (p. 550), can be written in two ways, and two isomerides are known. Similarly there can be three pentanes, four hexanes, six heptanes, &c.

It has been found by Schorlemmer that all the paraffins of which the constitution is known can be classified under four series, viz:—

1. *Normal paraffins*, in which no carbon atom is combined with more than two other carbon atoms. (See formulæ above.)
2. *Isoparaffins*, in which one carbon atom is combined with three others. Typical formula:—

3. *Neoparaffins* (Odling), in which one carbon atom is combined with four others. Typical formula:—

4. *Mesoparaffins* (Odling), containing the group $[\text{HC}(\text{CH}_3)_2]$ twice. Typical formula:—

With regard to the general properties of a paraffin, as compared with those of its isomerides, it has been observed that the boiling-points and specific gravities of the normal compounds are higher than those of the isomers. With respect to chemical stability, the normal paraffins are more difficultly decomposable than their isomers.

The following list contains the names, formulæ, boiling-points, and specific gravities of the most important paraffins known at the present time:—

NORMAL PARAFFINS.			
Names.	Formulæ.	Boiling-points	Specific gravities.
Methane.....	CH_4	Gaseous.	-600 at 0°C.
Ethane.....	$\text{CH}_3\cdot\text{CH}_3$		
Propane.....	$\text{CH}_3\cdot\text{CH}_2\cdot\text{CH}_3$		
Tetrane.....	$\text{CH}_3\cdot(\text{CH}_2)_2\cdot\text{CH}_3$		
Pentane.....	$\text{CH}_3\cdot(\text{CH}_2)_3\cdot\text{CH}_3$	37° - 39°	-628 „ 18°
Hexane.....	$\text{CH}_3\cdot(\text{CH}_2)_4\cdot\text{CH}_3$	69° - 70°	-663 „ 18°
Heptane.....	$\text{CH}_3\cdot(\text{CH}_2)_5\cdot\text{CH}_3$	98° - 99°	-691 „ 18°
Octane.....	$\text{CH}_3\cdot(\text{CH}_2)_6\cdot\text{CH}_3$	123° - 125°	-716 „ 16°
Nonane.....	$\text{CH}_3\cdot(\text{CH}_2)_7\cdot\text{CH}_3$	147° - 148°	-728 „ 13°
Decane.....	$\text{CH}_3\cdot(\text{CH}_2)_8\cdot\text{CH}_3$	166° - 168°	-739 „ 13°
Endecane.....	$\text{CH}_3\cdot(\text{CH}_2)_9\cdot\text{CH}_3$	180° - 184°	-765 „ 16°
Dodecane.....	$\text{CH}_3\cdot(\text{CH}_2)_{10}\cdot\text{CH}_3$	202°	-774 „ 17°
Tridecane.....	$\text{CH}_3\cdot(\text{CH}_2)_{11}\cdot\text{CH}_3$	216° - 218°	-792 „ 20°
Tetradecane...	$\text{CH}_3\cdot(\text{CH}_2)_{12}\cdot\text{CH}_3$	236° - 240°	?
Pentadecane...	$\text{CH}_3\cdot(\text{CH}_2)_{13}\cdot\text{CH}_3$	255° - 262°	-625 „ 16°
Hexadecane.....	$\text{CH}_3\cdot(\text{CH}_2)_{14}\cdot\text{CH}_3$	278°	Solid.

ISOPARAFFINS.

Names.	Formulae.	Boiling-points.	Specific gravities.
Isotetane or trimethyl-methane	HC $\begin{Bmatrix} \text{CH}_3 \\ \text{CH}_3 \\ \text{CH}_3 \end{Bmatrix}$	-15° C.	
Isopentane or ethyl-dimethyl-methane	HC $\begin{Bmatrix} \text{CH}_3 \\ \text{CH}_3 \\ \text{C}_2\text{H}_5 \end{Bmatrix}$	30°	?
Isohexanes	HC $\begin{Bmatrix} \text{CH}_3 \\ \text{CH}_3 \\ \text{C}_3\text{H}_7 \end{Bmatrix}$	62°	701 at 0° C.
	HC $\begin{Bmatrix} \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \\ \text{CH}_3 \end{Bmatrix}$?	?
	HC $\begin{Bmatrix} \text{C}_4\text{H}_9 \\ \text{CH}_3 \\ \text{CH}_3 \end{Bmatrix}$	90°	683 at 18°
Isoheptanes	HC $\begin{Bmatrix} \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \end{Bmatrix}$	96°	689 at 57°
	HC $\begin{Bmatrix} \text{C}_3\text{H}_7 \\ \text{C}_2\text{H}_5 \\ \text{CH}_3 \end{Bmatrix}$?	?
	HC $\begin{Bmatrix} \text{C}_4\text{H}_9 \\ \text{CH}_3 \\ \text{CH}_3 \end{Bmatrix}$	124°	703 at 12.5°

¹ These compounds have not hitherto been obtained, but are introduced in order to illustrate how the "constitution" theory of isomerism enables the existence of new compounds to be predicted with considerable certainty.

NEOPARAFFINS.

Names.	Formulae.	Boiling-points.	Specific gravity.
Neopentane or tetramethyl-methane	C $\begin{Bmatrix} \text{CH}_3 \\ \text{CH}_3 \\ \text{CH}_3 \\ \text{CH}_3 \end{Bmatrix}$	9.5° C.	?
Neohexane or trimethyl-ethyl-methane	C $\begin{Bmatrix} \text{C}_2\text{H}_5 \\ \text{CH}_3 \\ \text{CH}_3 \\ \text{CH}_3 \end{Bmatrix}$	43°-48°	?
Neoheptanes	C $\begin{Bmatrix} \text{C}_3\text{H}_7 \\ \text{CH}_3 \\ \text{CH}_3 \\ \text{CH}_3 \end{Bmatrix}$?	?
	C $\begin{Bmatrix} \text{C}_2\text{H}_5 \\ \text{C}_2\text{H}_5 \\ \text{CH}_3 \\ \text{CH}_3 \end{Bmatrix}$	86°-87°	696 at 20.5°

² See note to last table.

MESOPARAFFINS.

Names.	Formulae.	Boiling-points.	Specific gravities.
Meso-hexane or tetramethyl-ethane	$\begin{Bmatrix} \text{HC}(\text{CH}_3)_2 \\ \text{HC}(\text{CH}_3)_2 \end{Bmatrix}$	59° C.	670 at 17°
Meso-octane or tetramethyl-tetane	$\begin{Bmatrix} \text{HC}(\text{CH}_3)_2 \\ (\text{CH}_2)_2 \\ \text{HC}(\text{CH}_3)_2 \end{Bmatrix}$	110°	698 at 16°
	$\begin{Bmatrix} \text{HC}(\text{CH}_3)_2 \\ (\text{CH}_2)_3 \\ \text{HC}(\text{CH}_3)_2 \end{Bmatrix}$	132°	724 at 0°
Meso-decane or tetramethyl-hexane	$\begin{Bmatrix} \text{HC}(\text{CH}_3)_2 \\ (\text{CH}_2)_4 \\ \text{HC}(\text{CH}_3)_2 \end{Bmatrix}$	158°	727 at 14°

We now proceed to give a few methods of preparing some of the more important paraffins, which methods do not come under the previously described general processes of formation.

Methane.—This hydrocarbon is found as a constituent of coal-gas where it is produced by the destructive distillation of coal. It is formed synthetically by passing a mixture of carbon disulphide vapour and steam (or sulphuretted hydrogen) over copper heated to redness in a tube :—

Tetane may be prepared by exposing ethyl iodide over mercury to the action of sunlight :—

Isopentane (ethyl-dimethyl-methane) is formed by the dehydration of amyl alcohol by means of zinc chloride.

Neopentane (tetramethyl-methane) is prepared by the action of zinc-methide on trimethyl-iodomethane (katabutyl-iodide) :—

Hexane is produced by the action of hydriodic acid on benzene at 280° :—

Meso-hexane (tetramethyl-ethane) is formed by the action of hydriodic acid on *pinacone* a substance having the formula

produced by the action of sodium amalgam on dimethyl-ketone in presence of water.

Isopentane (tetramethyl-methane) is produced by the action of sodium on a mixture of the bromides of ethyl and amyl.

Solid Paraffin is, when purified, a white wax-like substance, melting between 40° and 60°, and boiling about 370°. It is contained in the tar produced by the distillation of Boghead and cannel coals, and is probably a mixture of several of the higher members of the $\text{C}_n\text{H}_{2n+2}$ series.

Second Series, C_nH_{2n} .—Olefine¹ Series.

General Properties.—These hydrocarbons furnish a good illustration of polymerism, as they form a series which is both homologous and polymeric. Being unsaturated compounds, they act as dyad radicles, uniting with Cl_2 , Br_2 , O , HCl , HBr , HI , ClHO , &c. The haloid compounds of the olefines treated with alcoholic potash give up one halogen atom and furnish mono-haloid derivatives :—

These mono-haloid olefines can again combine with Ha_2 and again lose Ha by the action of KHO :—

In this way 3, 4, ..., n atoms of hydrogen can be replaced by Ha_3 , Ha_4 , Ha_n atoms of halogen, and the final product can again unite with Ha_2 , forming a per-haloid paraffin derivative. For instance :—

The compounds of olefines with hypochlorous acid yield the corresponding alcohols by the action of nascent hydrogen :—

¹ So called from the oily liquids which these hydrocarbons produce when combined with chlorine.

Many olefines combine with sulphuric acid, forming ethereal salts, which are converted by the action of water into sulphuric acid and the corresponding alcohol:—

General Methods of Formation.—1. By heating the $C_nH_{2n+1}OH$ alcohols with dehydrating agents (H_2SO_4 , $ZnCl_2$, &c.):—

2. By electrolyzing $C_nH_{2n}(COOH)_2$ acids:—

3. By heating $N(C_nH_{2n+1})_4HO$ amines:—

4. By the action of copper-coated zinc foil (Gladstone and Tribe's "copper-zinc couple") on the corresponding dibromides:—

Isomerism.—The isomerides of the olefine series have been less completely investigated than those of the paraffins. The formula of the first member (ethene) might be written—

The first is probably the radicle in the free state, and the second the radicle in combination with Cl , Br , &c. The third formula represents a compound unknown in the free state, but known in combination. While the normal series are known as *ethene* compounds, the isomeric series are known as *ethidene* compounds.

Similarly there may be 4 propenes, 9 tetrenes, &c.

The following is a list of the C_nH_{2n} hydrocarbons known at the present time. An idea of the general physical properties will be obtained from the table.

ETHENE SERIES OR OLEFINES.		
Names.	Formulae.	Boiling-points.
Ethene or ethylene.....	C_2H_4	Gaseous
Propene or propylene.....	C_3H_6	-18° C.
Tetrene or tetrylene.....	C_4H_8	3°
Pentene or amylene.....	C_5H_{10}	35°
Hexene or hexylene.....	C_6H_{12}	65°
Heptene or heptylene.....	C_7H_{14}	95°
Octene or octylene.....	C_8H_{16}	120°
Nonene or nonylene.....	C_9H_{18}	140°
Decene or paranylene.....	$C_{10}H_{20}$	160°
Pentadecene or triamylene.....	$C_{15}H_{30}$	248°
Hexadecene or ectene.....	$C_{16}H_{32}$	275°
Vigintene or tetramylene.....	$C_{20}H_{40}$	390° - 400°
Heptavigintene or cerotene.....	$C_{27}H_{54}$? melts at 57°
Trigintene or melene.....	$C_{30}H_{60}$	375° (?) ,, 62°

The numerous isomerides of the higher members of the series cannot be described within the limits of the present article.

The first member, ethene, is a colourless inodorous gas, which can be condensed by cold and pressure. It burns with a brilliant flame, and is the constituent to which coal-gas chiefly owes its luminosity. Several olefines can be synthesized from other hydrocarbons; propene, for instance, by passing methane and carbon monoxide through a red-hot tube:—

Third Series, C_nH_{2n-2} .

General Properties.—These hydrocarbons are capable of acting as tetrad radicles uniting with 4 atoms of Cl , Br , &c., and producing tetra-haloid paraffin derivatives; or the

combination may be limited to 2 atoms, thus forming di-haloid olefines. Similarly they can combine directly with one or two molecules of haloid acids, producing $C_nH_{2n-1}Ha$, or $C_nH_{2n}Ha_2$. These combinations show their relations to the olefines and paraffins. Their relationship to the latter parent hydrocarbons is further shown by the ultimate action of chlorine:—

General Methods of Formation.—1. By the action of an alcoholic solution of potassium hydroxide on mono-haloid olefine derivatives:—

2. By the electrolysis of $C_nH_{2n-2}(COOH)_2$ acids:—

The following is a list of the hydrocarbons of this series:—

ETHINE OR ACETYLENE SERIES.		
Names.	Formula.	Boiling-point.
Ethine or acetylene.....	C_2H_2	Gaseous
Propine or allylene.....	C_3H_4	18° C.
Tetrine or erotonylene.....	C_4H_6	45°
Pentine or valerylene.....	C_5H_8	80°
Hexine or hexoylene.....	C_6H_{10}	107°
Heptine or ceantylidene.....	C_7H_{12}	133°
Octine or caprylidene.....	C_8H_{14}	165°
Decine or decenylene.....	$C_{10}H_{18}$	225°
Pentadecine or benylene.....	$C_{15}H_{28}$	280°
Hexadecine or cetenylen.....	$C_{16}H_{30}$	

But few of the isomerides of this series are known. *Diallyl*, C_6H_{10} (b. p. 59° C.), is isomeric with hexine, and *rutylene*, $C_{10}H_{18}$ (b. p. 150°), with decine.

Ethine or acetylene may be formed directly from its elements by causing the electric arc to pass between poles of dense carbon in an atmosphere of hydrogen. It is formed also by passing a mixture of methane and carbon monoxide through a red hot tube ($CH_4 + CO = C_2H_2 + OH_2$), by passing chloroform vapour over red hot copper ($2CHCl_3 + 6Cu = 3Cu_2Cl_2 + C_2H_2$), and by the imperfect combustion of most organic compounds. Ethine is a colourless, incondensable gas, having a characteristic odour. It is absorbed by an ammoniacal solution of cuprous chloride, forming a red precipitate of cuprous acetylide, $(C_2HCu)_2O$, which when heated with HCl furnishes pure ethine, so that this is a convenient method for purifying the hydrocarbon. Ethine can be made to combine with nascent hydrogen with the formation of ethene: $C_2H_2 + H_2 = C_2H_4$.

Fourth Series, C_nH_{2n-4} .

The hydrocarbons of this series may be conveniently divided into two groups. The first, consisting only of one member, *pentone* or *valylene* (C_5H_8), is related to the preceding series of hydrocarbons, since, by the addition of bromine the hexabrom-paraffin $C_5H_8Br_6$ is formed.

The other group is composed of *decene* ($C_{10}H_{16}$) and a series of hydrocarbons known as *terpenes*, having the general formula $C_{10}H_{16}$, and found in the essential oils of various plants, chiefly of the orders *Coniferae* and *Aurantiaceae*.

Terpenes.—These hydrocarbons are found in the wood, leaves, &c., of Coniferous trees, and in the essential oils of lemon, lavender, bergamot, juniper, &c., &c. Many of these oils contain oxidized bodies besides terpenes. The terpenes possess very similar chemical properties, differing chiefly in their boiling-points (which range from 160° to 176° C.) specific gravities, and action upon a ray of polarized light

thus furnishing a good illustration of physical isomerism (see p. 550). They are generally clear, highly refractive liquids, possessing characteristic odours, and easily polymerized by the action of heat, H_2SO_4 , BF_3 , &c. Several polymerides exist ready formed in oils of copaiba, cubebs, &c. The terpenes are characterized by the extreme readiness with which they undergo isomeric changes under the influence of reagents. They act as unsaturated compounds combining with at most four monad atoms. Thus, they combine with HCl , forming such compounds as $C_{10}H_{17}Cl$, $C_{10}H_{15}Cl_2$, and some terpenes can be made to combine with water, forming such bodies as $C_{10}H_{20}O_2$, $C_{10}H_{18}O$, and $C_{15}H_{24}O$, which, in certain respects, resemble alcohols. The best known terpene is *turpentine oil*, which is obtained from the resinous exudation of certain French and American species of *Pinus* and *Abies*.

Camphor ($C_{10}H_{16}O$) is an oxidized compound closely allied to the terpenes contained in the leaves of *Laurus Camphora*.

The relationship of the terpenes to the group of aromatic hydrocarbons is shown by the production of *cymene* ($C_{10}H_{14}$), a member of the C_nH_{2n-6} or benzene series, from turpentine oil and camphor, by the action of certain reagents.

Fifth Series, C_nH_{2n-6} .—Benzene or Aromatic Series.

The general characters of these hydrocarbons, as compared with the preceding series, have been previously considered (p. 552).

Occurrence.—Small quantities of these hydrocarbons are found in petroleum, but the chief source is the tar obtained in the destructive distillation of coal for the manufacture of coal-gas.

General Method of Synthetic Formation.—By heating a mixture of a mono-iodated paraffin and a brominated benzene hydrocarbon with sodium:—

Formulation and Isomerism of Benzene and its Derivatives.—Like the paraffins, the C_nH_{2n-6} hydrocarbons form a parent series giving rise to a vast number of derivatives, and just as the higher paraffins can be regarded as formed from methane by the substitution of C_nH_{2n+1} radicles for H, so the homologues of benzene can be considered as derived from this latter hydrocarbon by similar substitutions. Thus—

The synthesis of benzene from ethine has already been alluded to (p. 552). In accordance with this mode of formation, the structural formula of benzene may be written—

This formula, as will be seen on inspection, is in accordance with the fact that benzene can act as a hexatomic radicle, combining directly (though with difficulty) with 6 halogen atoms. Owing to the complex structure of the benzene molecule, an immense number of isomers are capable

of existing. A few of the most important cases may be here elucidated.

Let us, in the first instance, suppose one atom of H to be replaced by another element or radicle. Supposing (as there is at present no reason for doubting) that all the H and C atoms in the molecule have the same property, it is obvious that there can be no isomer of a mono-substitution derivative, and thus we know only one methyl benzene, chlorobenzene, nitrobenzene, &c.

Passing on to the poly-substitution derivatives, we have several possible causes of isomerism. Thus, the H atom may be replaced by one radicle, or more than one H atom may be replaced by an equivalent number of radicles, furnishing the same total number of C and H atoms. For instance—

Similarly diethyl-benzene is isomeric with tetramethyl-benzene, &c., &c. Another cause of isomerism is to be found in the C_nH_{2n+1} or other radicles replacing the H in the benzene molecule, since these radicals themselves admit of isomeric modifications, as has already been seen when the paraffin series were discussed. Thus, we may have—

With regard to substitution derivatives of the homologues of benzene, the H atoms may be replaced either in the benzene molecule or in the radicle; thus—

Another cause of isomerism depends on the relative positions of the replaced H atoms of the benzene molecule. Thus, there can be only one of each mono-substitution derivative, because it is immaterial which of the six H atoms is replaced. Di-derivatives containing two atoms of the same element or radicle are capable of three isomeric modifications, according as the replaced atoms are those numbered in the graphic formula 1 2 or 1 3 or 1 4. All other arrangements will be found on trial to be reducible to these (X representing the substituted element or radicle)—

In like manner there can be three tri- or tetra-derivatives, and only one penta- or hexa-derivative, when the H atoms are replaced by the same element or radicle.

When the H atoms are replaced by three or more different elements or radicles the possible number of isomerides is greater than when replaced by the same number of similar elements or radicles, because the arrangements of the latter with regard to one another are then capable of variation. Thus, there can be only three di-derivatives containing two different elements or radicles XY, because the reversal of their order does not affect the relative positions of X to Y. But when three H atoms are replaced by XXY elements or radicles we may have, for every isomeride depending on the relative position of XXY to one another and to the remaining H atoms, corresponding isomerides depending on the order XYX . The same reasoning applies to the higher derivatives.

The following is a list of the hydrocarbons of this series:—

AROMATIC OR BENZENE SERIES.			
Names.		Formulae.	Boiling-points.
C_6H_6	Benzene	C_6H_6	$81^\circ C.$
C_7H_8	Methylbenzene or toluene	$C_6H_5(CH_3)$	111°
	Ethylbenzene	$C_6H_5(C_2H_5)$	132°
C_8H_{10}	Dimethyl-benzenes or xylenes	Orthoxylene	$146^\circ - 141^\circ$
		Metaxylene	$137^\circ - 135^\circ$
		Paraxylene	139°
	Propylbenzene	$C_6H_5(C_3H_7)$	157°
	Pseudopropylbenzene	$C_6H_5(C_3H_7)$	151°
C_9H_{12}	Methyl-ethylbenzene		159°
	Trimethylbenzenes	Pseudocumene	166°
		Mesitylene	163°
	Isobutylbenzene	$C_6H_5.C_4H_9(CH_3)_2$	$159^\circ - 161^\circ$
	Methyl-propylbenzene	$C_6H_5(CH_3)(C_3H_7)$	$178^\circ - 179^\circ$
$C_{10}H_{14}$	Methyl-pseudopropylbenzene or α cymene	$C_6H_5(CH_3).CH(CH_3)_2$	$176^\circ - 178^\circ$
	Dimethyl-ethylbenzene	$C_6H_5(CH_3)_2(C_2H_5)$	$183^\circ - 184^\circ$
	Diethylbenzene	$C_6H_5(C_2H_5)_2$	$178^\circ - 179^\circ$
	Tetraethylbenzene or durene	$C_6H_2(CH_3)_4$	$189^\circ - 191^\circ$
$C_{11}H_{16}$	Isaomylybenzene	$C_6H_5.C_4H_9(CH_3)_2$	193°
	Methyl-diethylbenzene or diethyl-toluene	$C_6H_5(CH_3)(C_2H_5)_2$	178°
	Dimethyl-pseudopropylbenzene or laurene	$C_6H_5(CH_3)_2.CH(CH_3)_2$	188°
$C_{12}H_{18}$	Methyl-isaomylybenzene	$C_6H_5(CH_3).C_4H_9(CH_3)_2$	213°
$C_{13}H_{20}$	Dimethyl-isaomylybenzene	$C_6H_5(CH_3)_2.C_4H_9(CH_3)_2$	223°

Other hydrocarbons compounded of benzene residues and C_nH_{2n-1} , &c., radicals are known. *Dipropargyl*, C_6H_6 (b.p. $85^\circ C.$), is a substance isomeric with benzene, having the formula $HC \equiv C-(CH_2)_2-C \equiv CH$. The hydrocarbons of the benzene series are all colourless liquids (*durene* is solid), having peculiar and characteristic odours. By the action of oxidizing agents aromatic hydrocarbons of the general formula $C_6H_6-n(C_nH_{2n+1})_m$ are ultimately converted into acids of the general form $C_6H_6-n(COOH)_m$. Nitric acid gives rise to the formation of nitro-derivatives $C_nH_{2n-(6+m)}(NO_2)_m$. Sulphuric acid (concentrated) forms sulphonic acids $C_nH_{2n-(6+m)}(HSO_3)_m$. The halogens produce substitution derivatives $C_nH_{2n-(6+m)}Ha_m$, the particular metameric modification formed being often determined by the temperature at which the halogen is made to act. *Benzene*, *toluene*, &c., are formed by heating their corresponding acids with lime: $C_nH_{2n-7}(COOH) - CO_2 = C_nH_{2n-6}$.

The remaining series of hydrocarbons are as follows:—

Names.	Formulae.
C_nH_{2n-8} .	
Phenylene	C_6H_4
Cinnamene or styrolene	$C_9H_8 = C_6H_5.C_3H_3$
Allylbenzene	$C_9H_{10} = C_6H_5.C_3H_5$
Phenylbutene	$C_{10}H_{12} = C_6H_5.C_4H_7$
Tetrahydronaphthalene	$C_{10}H_{12} = C_{10}H_8.H_4$
C_nH_{2n-10} .	
Ethynylbenzene or acet- enylbenzene	$C_8H_6 = C_6H_5.C_2H$
Dihydronaphthalene	$C_{10}H_{10} = C_{10}H_8.H_2$
Cholesterene	$C_{25}H_{42}$
C_nH_{2n-12} .	
Naphthalene	$C_{10}H_8$
	$C_{11}H_{10} = C_{10}H_7.CH_3$
	$C_{12}H_{12} = C_{10}H_7.C_2H_5$
Hexa-hydroanthracene	$C_{14}H_{16} = C_{14}H_{10}.H_6$
C_nH_{2n-14} .	
Diphenyl	$C_{12}H_{10} = C_6H_5.C_6H_5$
Acenaphthene	$C_{12}H_{10} = C_{10}H_7.C_2H_3$
Diphenyl-methane	$C_{13}H_{12} = CH_2(C_6H_5)_2$
Dibenzyl or diphenyl ethane	$C_{15}H_{14} = C_2H_4(C_6H_5)_2$
Ditolyl	$C_{14}H_{14} = \begin{cases} C_6H_4.CH_3 \\ C_6H_4.CH_3 \end{cases}$
Phenyl-tolyl-methane or Benzyltoluene	$C_{14}H_{14} = H_2C \begin{cases} C_6H_5 \\ C_6H_5(C_2H_5) \end{cases}$

Names.	Formulae.
Benzyl-ethyl-benzene	$C_{15}H_{18} = C_6H_5.CH_2.C_6H_4.C_2H_5$
Benzyl-xylenes	$C_{15}H_{18} = C_6H_5.CH_2.C_6H_3(CH_3)_2$
Dimesityl methane	$C_{19}H_{24} = H_2C \begin{cases} C_6H_4(CH_3)_3 \\ C_6H_4(CH_3)_3 \end{cases}$
C_nH_{2n-16} .	
Fluorene	$C_{13}H_{10} = C_{12}H_8.CH_2$
Stilbene or diphenyl-ethene	$C_{14}H_{12} = C_2H_2(C_6H_5)_2$
Dihydro-anthracene	$C_{14}H_{12} = C_{14}H_{10}.H_2$
Hexa-hydropyrene	$C_{16}H_{16} = C_{16}H_{10}.H_6$
C_nH_{2n-18} .	
Anthracenes	$C_{14}H_{10} = \begin{array}{c} HC-C_6H_4 \\ \diagup \quad \diagdown \\ C_6H_4 \end{array}$
Phenanthrene	$C_{14}H_{10} = \begin{array}{c} HC-C_6H_4 \\ \diagup \quad \diagdown \\ C_6H_4 \end{array}$
Tolane or Diphenyl-ethine	$C_{14}H_{10} = \begin{array}{c} HC-C_6H_4 \\ \diagup \quad \diagdown \\ C_6H_5 \end{array}$
Dimethyl-anthracene	$C_{16}H_{14} = C_{14}H_{10}(CH_3)_2$
Tetramethyl-anthracene or Retene	$C_{18}H_{18} = C_{14}H_{10}(CH_3)_4$
C_nH_{2n-20} .	
Naphthyl-phenyl methane	$C_{17}H_{14} = H_2C \begin{cases} C_6H_5 \\ C_{10}H_7 \end{cases}$
C_nH_{2n-22} .	
Pyrene	$C_{16}H_{10} = C_{10}H_6(C_6H_4)$
Diphenyl-diethine or di- acetylenyl-benzene	$C_{16}H_{10} = C_4(C_6H_5)_2$
Diphenyl-benzene	$C_{18}H_{14} = C_6H_5(C_6H_5)_2$
Triphenylmethane	$C_{19}H_{16} = CH(C_6H_5)_3$
C_nH_{2n-24} .	
Chrysene	$C_{18}H_{12}$
C_nH_{2n-26} .	
Dinaphthyl	$C_{20}H_{14} = C_{10}H_7.C_{10}H_7$
C_nH_{2n-30} .	
Idrialene	$C_{22}H_{14}$
Triphenyl-benzene	$C_{24}H_{18} = C_6H_3(C_6H_5)_3$
C_nH_{2n-32} .	
Tetraphenyl-ethene	$C_{26}H_{20} = C_2(C_6H_5)_4$

The hydrocarbons benzene (C_6H_6), naphthalene ($C_{10}H_8$), anthracene ($C_{14}H_{10}$), chrysene ($C_{18}H_{12}$), and idrialene

($C_{2n}H_{14}$) are noteworthy as forming a homologous series, the successive terms of which differ by $+C_4H_2$. These compounds present certain analogies in their chemical behaviour, and are particularly characterized by their giving rise to *quinones* when oxidized. In the formation

of a quinone H_2 is replaced by O_2 $\left(\begin{array}{c} O \\ | \\ O \end{array} \right)$; thus—

The hydrocarbons, being the parent compounds of the remaining organic bodies, have been treated in greater detail than is necessary in the case of the other families.

II. ALCOHOLS.

Formulation and Classification.—It has already been

Alcohols containing 1, 2, n semi-molecules of hydroxyl are said to be *monohydric*, *dihydric*, *n-hydric*. The dihydric alcohols of the ethene series are termed *glycols*. Alcohols derived from unsaturated hydrocarbons act as unsaturated compounds.

Series $C_nH_{2n+1}.HO$.—Some of these alcohols (derived from paraffins) have been previously quoted in illustration of homologous series (p. 552). The first member, methyl alcohol (CH_3HO), is termed *carbinol*, and the remaining terms can be derived from this by the replacement of H by C_nH_{2n+1} radicles. Thus,—

Since the paraffins can be formulated as derivatives of methane (sec p. 556), and the present series of alcohols as derivatives of paraffins, it follows that these alcohols can be likewise regarded as methane derivatives:—

It will be convenient to distinguish the carbon atom in combination with hydroxyl as the "typical carbon atom."

The higher members of the series are susceptible of several kinds of isomerism, which may now be considered. Passing over the first two members, which are not capable of being formulated in more than one way, the third member (propyl alcohol) may be written as—

Thus, the first kind of isomerism consists in the replacement of one C_nH_{2n+1} radicle by two others, each containing

Pyrene ($C_{16}H_{10}$), although not a member of the series, furnishes a quinone on oxidation. Benzene does not yield a quinone by direct oxidation.

The relationship of the second and third members of the series to benzene will be seen from their graphic formulæ:—

pointed out that alcohols can be considered as derivatives of hydrocarbons by the substitution of hydroxyl for hydrogen, and, consequently, as compounds of hydroxyl with hydrocarbon radicles (p. 553). Each series of hydrocarbons can thus be supposed to give rise to a corresponding series of alcohols:—

a smaller number of carbon atoms. The fourth member of the series (tetryl or butyl alcohol) may be written:—

The next kind of isomerism, as exemplified by the third of the above formulæ, consists in the substitution of three C_nH_{2n+1} radicles for the three hydrogen atoms of carbinol.

Now, as carbinol contains but three replaceable hydrogen atoms (not regarding the atom contained in the hydroxyl, the replacement of which gives rise to a new class of compounds), trimethyl carbinol is the type of a series of alcohols, in which the number of C_nH_{2n+1} radicles combined with the typical carbon atom is a maximum. The isomeric alcohols of the present series can thus be conveniently classified under the three following groups:—

1. *Primary alcohols*, in which the typical carbon atom is combined with but one other carbon atom—

2. *Secondary alcohols*, in which the typical carbon atom is combined with two other carbon atoms—

3. *Tertiary alcohols*, in which the typical carbon atom is combined with three other carbon atoms—

Another cause of isomerism among alcohols is to be found in the constitution of the C_nH_{2n+1} radicles (see also p. 550). Thus we may have—

Each of the three above-named groups is thus capable of a further division into two sub-groups, such as *normal*

primary and iso-primary, normal secondary and iso-secondary, &c., &c. In the higher members a further number of isomeric modifications become possible. Many of these isomeric alcohols are known, but a large number have yet to be discovered to complete the series. The following is a list of the normal primary alcohols:—

Names.	Formulae.	Boiling-points.
Methyl alcohol.....	CH_3HO	66° C.
Ethyl ".....	$\text{C}_2\text{H}_5\text{HO}$	78°·4
Propyl ".....	$\text{C}_3\text{H}_7\text{HO}$	97°·6
Butyl ".....	$\text{C}_4\text{H}_9\text{HO}$	116°
Amyl ".....	$\text{C}_5\text{H}_{11}\text{HO}$	137°
Hexyl ".....	$\text{C}_6\text{H}_{13}\text{HO}$	157°
Heptyl ".....	$\text{C}_7\text{H}_{15}\text{HO}$	176°·5
Octyl ".....	$\text{C}_8\text{H}_{17}\text{HO}$	196°·5
Nonyl ".....	$\text{C}_9\text{H}_{19}\text{HO}$	200°?
Cetyl ".....	$\text{C}_{16}\text{H}_{33}\text{HO}$	50°
Ceryl ".....	$\text{C}_{27}\text{H}_{55}\text{HO}$	79°
Melissyl ".....	$\text{C}_{30}\text{H}_{61}\text{HO}$	88°

These alcohols (up to nonyl alcohol) are limpid liquids, the viscosity of which increases with the molecular weight. The three other members are white crystalline solids. Methyl, ethyl, and propyl alcohols are readily miscible with water, the remaining members are more or less of the nature of oils. Most of these alcohols possess peculiar and characteristic odours. The boiling-points of the isomers are generally lower than those of the corresponding normal alcohols.

The normal and iso-primary alcohols can be obtained from the corresponding haloid paraffin derivatives by the action of potassium hydroxide:—

Normal primary.. $\text{C}_n\text{H}_{2n+1}\text{Ha} + \text{KHO} = \text{C}_n\text{H}_{2n+1}\text{HO} + \text{KHa}.$

Iso-primary..... $(\text{CH}_3)_2\text{CH}(\text{CH}_2)_n\text{Ha} + \text{KHO}$
 $= (\text{CH}_3)_2\text{CH}(\text{CH}_2)_n\text{HO} + \text{KHa}.$

Likewise by the action of nascent hydrogen on the corresponding normal primary and iso-primary aldehydes:—

$(\text{C}_n\text{H}_{2n+1})\text{COH} + \text{H}_2 = \text{C}_n\text{H}_{2n+1}\text{CH}_2\text{HO}.$

The synthesis of alcohols from the corresponding olefines has already been alluded to (p. 559). Since ethine can be formed directly from its elements (p. 559), and ethene from ethine (p. 559), it is obvious that ethyl alcohol can by these means be formed synthetically.

Secondary alcohols are produced by the action of nascent hydrogen on ketones:—

$\text{CO}(\text{C}_n\text{H}_{2n+1})_2 + \text{H}_2 = \text{C}(\text{C}_n\text{H}_{2n+1})_2\text{HHO}.$

Tertiary alcohols are prepared by the action of organo-zinc compounds on the chlorides of acid radicles, $\text{C}_n\text{H}_{2n+1}\text{COCl}$, and treatment of the product with water.

The metamerism of the three groups of alcohols is strikingly displayed by their behaviour on oxidation. Thus, primary or iso-primary alcohols are oxidized first to aldehydes—

$(\text{C}_n\text{H}_{2n+1})\text{CH}_2\text{HO} + \text{O} = (\text{C}_n\text{H}_{2n+1})\text{COH} + \text{OH}_2;$
 Alcohol Aldehyde.

then to acids containing the same number of carbon atoms—

$(\text{C}_n\text{H}_{2n+1})\text{COH} + \text{O} = \text{C}_n\text{H}_{2n+1}\text{COOH}.$
 Aldehyde Acid.

Secondary alcohols are oxidized first to ketones—

$\text{C}(\text{C}_n\text{H}_{2n+1})_2\text{HHO} + \text{O} = \text{CO}(\text{C}_n\text{H}_{2n+1})_2 + \text{OH}_2;$
 Alcohol Ketone.

then to one or more acids containing a smaller number of carbon atoms than the alcohol—

$\text{CO}(\text{C}_n\text{H}_{2n+1})_2 + 3\text{O} = \text{C}_n\text{H}_{2n+1}\text{COOH} + \text{C}_n\text{H}_{2n}\text{O}_2.$
 Ketone Acid Acid.

Tertiary alcohols are probably first oxidized to ketones,

and ultimately to a mixture of two or more acids containing a smaller number of carbon atoms than the alcohol.

By particular reactions an alcohol of one group can be converted into an isomer of another group, such, for instance, as normal primary butyl alcohol into the iso-primary alcohol, and the latter into the tertiary alcohol.

In many of their reactions alcohols are the analogues of water; for instance—

$\text{HHO} + \text{K} = \text{KHO} + \text{H}$
 Water. Potassium. Potassium hydroxide.

$\text{C}_2\text{H}_5\text{HO} + \text{K} = \text{C}_2\text{H}_5\text{KO} + \text{H}.$
 Ethyl alcohol. Potassium ethylate.

In other reactions they resemble metallic hydroxides:—

$\text{KHO} + \text{HCl} = \text{KCl} + \text{OH}_2$
 Potassium hydroxide. Potassium chloride.

$\text{C}_2\text{H}_5\text{HO} + \text{HCl} = \text{C}_2\text{H}_5\text{Cl} + \text{OH}_2$
 Ethyl alcohol. Ethyl chloride.

Of this series the best known members are methyl and ethyl alcohols. The former (or "wood-spirit") is chiefly obtained from the crude "wood vinegar" produced by the destructive distillation of wood. Ethyl alcohol is common "spirits of wine," and is always procured by the fermentation of sugar, which, in contact with yeast, undergoes the following change— $\text{C}_6\text{H}_{12}\text{O}_6 = 2\text{CO}_2 + 2\text{C}_2\text{H}_5\text{HO}.$

Many of the higher members are formed by the fermentation of grain, sugar-beet molasses, potato, &c. *Fusel oil* consists chiefly of isomeric modifications of amyl alcohol.

Names.	Formulae.	Boiling-points.
$\text{C}_n\text{H}_{2n-1}\text{HO}.$		
Vinyl alcohol	$\text{C}_2\text{H}_3\text{HO}$?
Allyl ".....	$\text{C}_3\text{H}_5\text{HO}$	96° C.
$\text{C}_n\text{H}_{2n-3}\text{HO}.$		
Propargyl alcohol.....	$\text{C}_3\text{H}_3\text{HO}$	110°-115°
Borneol and camphol....	$\text{C}_{10}\text{H}_{17}\text{HO}$	212°

Series $\text{C}_n\text{H}_{2n-7}\text{HO}$, Phenols.—The alcohols of this series bear the same relation to the benzene hydrocarbons that the ethyl series of alcohols bear to the paraffins. Thus these alcohols at once divide themselves into two metameric series according as the hydroxyl replaces hydrogen in the benzene or paraffin radicle; for instance, methyl benzene or toluene ($\text{C}_6\text{H}_5\text{CH}_3$) gives rise to—

$\text{C}_6\text{H}_4(\text{HO})\text{CH}_3$ and $\text{C}_6\text{H}_5\text{CH}_2(\text{HO}).$
 Cresol. Benzyl alcohol.

The alcohols of the benzylic series $\left\{ \text{C}_6\text{H}_5-\text{m} \left\{ \text{C}_n\text{H}_{2n}(\text{HO}) \right\} \right\}$ are true alcohols in their chemical behaviour, being formed from the haloid derivatives of their corresponding hydrocarbons by the action of potassium hydroxide, and being oxidized to acids containing the same number of carbon atoms. The alcohols represented by cresol, $\text{C}_6\text{H}_5-\text{m}\text{HO}(\text{C}_n\text{H}_{2n+1})$, or phenols, on the other hand, act more like saturated compounds, and in some respects resemble acids. They cannot be directly obtained from their corresponding halo-hydrocarbon derivatives, and are converted by oxidative into quinones. The phenols yield substitution-derivatives by the action of halogens, nitric acid, &c.; such, for example, as—

$\text{C}_6\text{H}_4\text{ClHO}$, $\text{C}_6\text{Cl}_5\text{HO}$;
 Monochloro-phenol. Pentachloro-phenol.

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{HO}$, $\text{C}_6\text{H}_3(\text{NO}_2)_3\text{HO}$, $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{H}$
 Mononitrophenol. Dinitrophenol. Trinitrophenol or picric acid.

The phenols yield *sulphonic acids* when acted on by strong sulphuric acid, $\text{C}_6\text{H}_4(\text{HO})(\text{HSO}_3)$, $\text{C}_6\text{H}_3(\text{HO})(\text{HSO}_3)_2$.

&c.; the metameric alcohols do not undergo an analogous reaction.

The homologues of phenol being di-derivatives of benzene are susceptible of the isomeric modifications already pointed out (p. 560). Thus there are known—

Isomerism analogous to that exhibited by the derivatives of benzene and its homologues likewise extends to all the derivatives of phenol and its homologues.

The following is a brief list of the compounds of the present series:—

Alcohols.	
Benzyl alcohol, $\text{C}_6\text{H}_5\cdot\text{CH}_2\text{HO}$	Cumylalcohols $\left\{ \text{C}_9\text{H}_{11}\cdot\text{CH}_2\text{HO} \right.$
Xylyl alcohols, $\text{C}_7\text{H}_7\cdot\text{CH}_2\text{HO}$	Sycoceryl alcohol $\left\{ \text{C}_{17}\text{H}_{27}\cdot\text{CH}_2\text{HO} \right.$
Phenyl-propyl alcohols ... $\text{C}_8\text{H}_9\cdot\text{CH}_2\text{HO}$	
Phenols.	
Phenol..... $\text{C}_6\text{H}_5\cdot\text{HO}$	Xylenols, Phlorol, &c., $\text{C}_8\text{H}_9\cdot\text{HO}$
Cresols $\text{C}_6\text{H}_4(\text{CH}_3)\cdot\text{HO}$	Thymol, Carvacrol, $\text{C}_{10}\text{H}_{13}\cdot\text{HO}$

The boiling-points of the alcohols are generally higher than those of the metameric phenols.

Many of the compounds of the present series are transparent oily liquids possessed of powerful odours; others are white crystalline solids. Of the phenols the best known is *phenol* or *carbolic acid*, obtained from the acid portions of coal-tar.

Series $\text{C}_n\text{H}_{2n-9}\cdot\text{HO}$ comprises *cinnamic alcohol*, $\text{C}_9\text{H}_9\cdot\text{HO}$, and *cholesterin*, $\text{C}_{26}\text{H}_{53}\cdot\text{HO}$.

Series $\text{C}_n\text{H}_{2n-11}\cdot\text{HO}$.—Only one member is known, viz., *naphthol*, $\text{C}_{10}\text{H}_7\cdot\text{HO}$.

Series $(\text{C}_n\text{H}_{2n})''(\text{HO})_2$, *Glycols*.—Of these dihydric alcohols the terms corresponding to the first six members of the olefine series are known, and are named ethene glycol, propene glycol, &c. The glycols are colourless, viscid liquids, miscible with water. They are generally prepared by acting on di-haloid olefine compounds with silver acetate: $\text{C}_n\text{H}_{2n}\text{Br}_2 + 2\text{AgC}_2\text{H}_3\text{O}_2 = \text{C}_n\text{H}_{2n}(\text{C}_2\text{H}_3\text{O}_2)_2 + 2\text{AgBr}$. The resulting acetate is then heated with potassium hydroxide: $\text{C}_n\text{H}_{2n}(\text{C}_2\text{H}_3\text{O}_2)_2 + 2\text{KHO} = \text{C}_n\text{H}_{2n}(\text{HO})_2 + 2\text{KC}_2\text{H}_3\text{O}_2$. The glycols are capable of existing in isomeric forms similar to those of analogous olefine compounds (sec p. 559), but these isomers are at present but imperfectly known. A series of compounds known as *polyethenic glycols* are formed from ethene glycol by condensation, with elimination of water. Their general formula is $n\{\text{C}_2\text{H}_4(\text{HO})_2\} - (n-1)(\text{OH}_2)$, where the highest value of n is 6.

Series $\text{C}_n\text{H}_{2n-8}(\text{HO})_2$, *Dihydric Phenols*.—The following are known:—

Pyrocatechin (<i>ortho</i> -), Resorcin (<i>meta</i> -), Hydroquinone ¹ (<i>para</i> -).....	$\text{C}_6\text{H}_4(\text{HO})_2$
Saligenin, Orein, Guaiacol	$\text{C}_7\text{H}_6(\text{HO})_2$
Xylene glycol, Crescol, Veratrol	$\text{C}_8\text{H}_8(\text{HO})_2$
Hydrothymoquinone	$\text{C}_{10}\text{H}_{12}(\text{HO})_2$

Many of these compounds can be formed by suitable reactions from benzenic hydrocarbons, phenols, &c.; others are found ready formed in lichens, or can be prepared from substances of vegetable origin.

Series $(\text{C}_n\text{H}_{2n-1})'''(\text{HO})_3$ comprises *propenyl alcohol* or *glycerin*, $\text{C}_3\text{H}_5(\text{HO})_3$, and *amyl-glycerin*, $\text{C}_5\text{H}_9(\text{HO})_3$. Glycerin can be formed synthetically, but is generally

obtained from *glycerides*, a group of ethereal salts composed of glycerin and acids of the acetic and oleic series (see p. 572), which exist ready formed in most animal and vegetable oils and fats. Thus *stearin* (propenyl tristearate), a constituent of many natural fats, when acted upon by super-heated steam, decomposes as shown in the equation—

Large quantities of glycerin are obtained by this means. Glycerin is a colourless, transparent, viscid liquid of a sweetish taste, readily soluble in water, and boiling (under 50 mm. pressure) at 210°C . *Polyglycerins* analogous to the polyethenic glycols are known.

Series $(\text{C}_n\text{H}_{2n-9})'''(\text{HO})_3$.—*Trihydric phenols* comprising the isomerides *pyrogalllic acid* (or *pyrogallol*) and *phloroglucin*, $\text{C}_6\text{H}_3(\text{HO})_3$.

Series $(\text{C}_n\text{H}_{2n-2})''(\text{HO})_4$.—*Erythrite*, *erythromannite* or *phycite*, $\text{C}_4\text{H}_6(\text{HO})_4$, and *propyl-phycite*, $\text{C}_3\text{H}_4(\text{HO})_4$.

Series $(\text{C}_n\text{H}_{2n-5})'(\text{HO})_5$.—*Pinite* and *quercite*, $\text{C}_6\text{H}_7(\text{HO})_5$.

Series $(\text{C}_n\text{H}_{2n-4})''(\text{HO})_6$.—*Mannite* and *dulcite*, $\text{C}_6\text{H}_8(\text{HO})_6$, two natural sugars.

Sugar, starch, gum, &c., are members of a group of compounds termed *carbohydrates*², which are closely allied to the present series of alcohols. The names, classification, and relationship of these bodies are shown in the following table:—

CARBOHYDRATES.		
Glucoses. $\text{C}_6\text{H}_{12}\text{O}_6$.	Saccharoses. Polyglucosic alcohols. $n(\text{C}_6\text{H}_{12}\text{O}_6) - (n-1)(\text{OH}_2)$ ($n=2$).	Amyloses. Polyglucosic anhydrides. $n(\text{C}_6\text{H}_{10}\text{O}_5)$.
Dextrose or grape-sugar. Levulose. Galactose. Sorbin. Eucalin. Inosite. Arabinose.	Saccharose or cane sugar. Lactose or milk sugar. Arabin or gum-arabic. Melitose. Melizitose. Trehalose or mycose.	Starch. Inulin. Dextrin. Cellulose or lignin. Glycogen.

The glucoses exhibit the characters both of aldehydes and of alcohols; the saccharoses bear the same relationship to the glucoses that the polyethenic glycols bear to glycol; the amyloses are formed from the saccharoses by the elimination of one molecule of water.

Many of the sugars are widely diffused throughout the vegetable kingdom—the sugar in ordinary use being obtained from the sugar-cane and sugar-beet. Dextrose and levulose are found in honey, ripe fruits, &c., lactose in milk, inosite in flesh. Gum-arabic is the dried exudation of certain species of *Acacia*. All the amyloses, with the exception of glycogen, which is found in the liver of animals, are of vegetable origin. Cellulose or lignin is the chief constituent of the cells of plants; starch is found in the cells of most plants. *Gun-cotton* or *pyroxylin* is obtained from cotton-wool, which is almost pure cellulose, by the action of strong nitric acid; it has the composition of trinitro-cellulose, $\text{C}_6\text{H}_7(\text{NO}_2)_3\text{O}_5$. Many of the varieties of the sugars are physical isomerides differing from each other only in their rotatory action on polarized light.

III. HALOID ETHERS.

These compounds can be formed from saturated hydrocarbons, and from hydrocarbons which behave as such by the direct action of the halogen:—

¹ The quinones are also closely related to ketones.

² So called because the hydrogen and oxygen are always present in these compounds in the proportions to form water.

The substitution can in many cases be continued atom by atom, till the whole of the hydrogen is replaced; thus:—

The reactions are often accelerated and in some cases remarkably modified by light or heat. The presence of iodine, antimony, &c., frequently assists the action of chlorine. Chlorine is more energetic than bromine, and the action of iodine less energetic than that of bromine,—iodine, in fact, does not act directly on the paraffins. By the direct action of halogens on paraffins a mixture containing more than one derivative is generally obtained. Thus, when chlorine and methane are mixed and exposed to diffused light (explosion takes place in direct sunlight), the whole series of derivatives CH₃Cl, CH₂Cl₂, CHCl₃, and CCl₄ are formed.

Unsaturated hydrocarbons first of all combine directly with a certain number of halogen atoms. In some cases the number of halogen atoms thus taken up restores the compound to the type of a saturated body:—

In other cases the restoration is not to the type of a saturated hydrocarbon:—

The mono-haloid derivatives of paraffins and some other hydrocarbons are conveniently prepared by the action of haloid acids on the corresponding alcohols:—

Polyhydric alcohols may by these reactions have their hydroxyl only partially replaced by halogens:—thus, by the action of hydrochloric acid on glycerin there are produced C₃H₇Cl(HO)₂ (*chlorhydrin*) and C₃H₇Cl₂(HO) (*dichlorhydrin*).

The haloid phosphorus compounds act upon alcohols in a manner similar to that of the halogen acids:—

The haloid ethers are liable to the same isomeric modifications as their parent hydrocarbons and derivatives. The conditions which determine the production of any particular modification cannot in all cases be laid down with precision. For instance, the di-haloid paraffin derivatives obtained from the paraffins are in some cases identical and in other cases isomeric with the corresponding compounds produced by the direct union of halogens with olefines. Again, the higher members of the paraffin series when acted on by chlorine yield simultaneously two isomeric (primary and secondary) mono-chlorinated derivatives. As a final example, when chlorine acts upon *toluene* in the cold *chloro-toluenes* (C₆H₄Cl.CH₃, C₆H₃Cl₂.CH₃, &c.) are

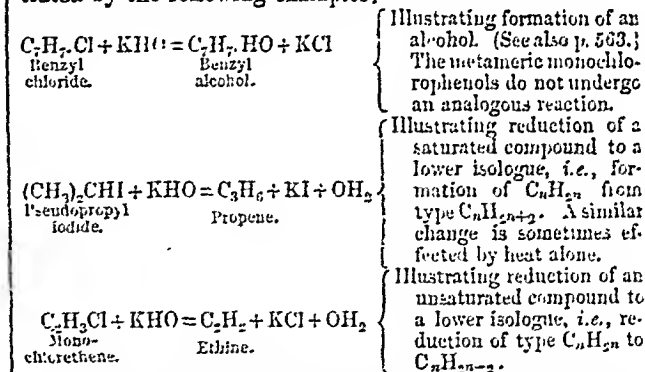

formed, but when the action takes place with boiling *toluene* the substitution takes place in the methyl radicle, thus forming *benzyl* compounds (C₆H₅.CH₂Cl, &c.)

Alcohols are reproduced from their haloid ethers by the action of KHO (see p. 563), or by first converting the haloid ether into an acetate of the radicle by treatment with silver acetate, and then acting on the acetate with KHO. The alcohols thus formed are similar in isomeric constitution to the haloid ethers from which they are obtained. For instance, (CH₃)₂CH.I (pseudopropyl iodide) when made to undergo the reactions specified is converted into (CH₃)₂CH.HO (pseudopropyl alcohol) (see also p. 563). Isomeric haloid ethers are thus named in accordance with the radicle composing the alcohols from which they are obtained, or to which they give rise on conversion into acetates and treatment with KHO; thus, we have the following mono-iodobutanes:—

The same relations exist between the haloid ethers and their isomerides as between the paraffins and their isomerides. Thus, the boiling points and specific gravities of the normal ethers are higher, and their chemical stability is greater than that of the isomerides.

By the action of nascent hydrogen many haloid ethers are restored to the hydrocarbons from which they are derived by an inverse substitution. Thus tetrachloromethane (CCl₄) when treated with sodium amalgam and water is ultimately converted into methane (CH₄), monochlorbenzene (C₆H₅Cl) into benzene, &c. The action of caustic alkalies upon mono-haloid ethers will be best illustrated by the following examples:—

The mono-haloid olefines (typified by monochlorethene in the last equation) are obtained by the action of a caustic alkali on di-haloid paraffins (see p. 558). These mono-haloid olefines, like their parent olefines, are dyad radicles combining with *Ha*₂ and *HHa*. Their compounds with haloid acids are under some conditions identical and under other conditions isomeric with the corresponding compounds produced by the direct combination of the olefine with two halogen atoms.

Of the haloid ethers derived from paraffins the best known is trichloromethane or *chloroform* (CHCl₃), a colourless, transparent, sweet-tasting, and somewhat fragrant liquid boiling at 62°, largely used as an anæsthetic. It can be prepared by the direct action of chlorine on methane, but it is usually obtained by the action of bleaching-powder on common alcohol. The corresponding bromine and iodine compounds, CHBr₃ and CHI₃ (*bromoform* and *iodoform*), and CH(NO₂)₃ (*nitroform*), are known *Cyano-derivatives of Hydrocarbons*.—The metameric exhibited by these compounds has been already referred to (p. 555), and since they resemble in many respects the haloid ethers, their modes of preparation may be now touched upon.

¹ The metameric phenol, cresol (p. 564), does not undergo a similar reaction.

The most general method of obtaining the cyanides (nitriles) in a state of purity is the dehydration of the ammonium salts of acids containing the corresponding hydrocarbon radicles (see also p. 555).

Most of the other processes yield a mixture of cyanides and isocyanides :—

In the first of these methods the cyanide predominates, and in the second the isocyanide. By distilling a mixture of potassium cyanide with an ethereo-metallic salt of sulphuric or sulphurous acid, a mixture of cyanide and isocyanide of the radicle contained in the ethereal salt is obtained, the cyanide or nitrile being in excess :—

The cyanides or nitriles do not exhibit strongly marked basic properties, nor are they oxidized by Ag_2O or HgO . They are not poisonous, and do not possess unpleasant odours. Their boiling-points are generally higher than those of the metameric isocyanides. The nitriles are susceptible of isomeric modifications depending on the isomerism of their contained hydrocarbon radicles.

IV. ETHERS.

These compounds bear to the alcohols the same relations that the metallic oxides bear to the hydroxides :—

In accordance with this view, many ethers are formed by dehydrating their corresponding alcohols by means of strong sulphuric acid, zinc chloride, boron trioxide, &c. :—

Conversely, many ethers, by prolonged heating with water, are retransformed into their corresponding alcohols.

Oxygen being a diatomic element combines with two monatomic radicles. When the two radicles are similar the compound is termed a *simple ether*, when dissimilar a *compound ether*. Thus, the ethers formulated above (methyl and benzyl) are simple ethers; while

are examples of compound ethers. Compound ethers containing a $\text{C}_n\text{H}_{2n+1}$ and a $\text{C}_m\text{H}_{2m+1}$ radicle are termed *anisols*.

Ethers are liable to isomeric modifications dependent on the isomerism of their contained radicles, and likewise to metamerism depending on the presence of different radicles. For example, $\text{C}_2\text{H}_5\text{O} \cdot \text{C}_4\text{H}_9$ (*ethyl-butyl ether*) would be metameric with $(\text{C}_3\text{H}_7)_2\text{O}$ (*propyl ether*).

A general method of preparing ethers (simple and compound) containing monatomic radicles is to act upon the sodium derivative of the alcohol containing the one radicle with the haloid ether containing the other radicle. When the alcohol and haloid ether contain the same radicles, the result is a simple ether; when they contain different radicles a compound ether is produced :—

The ethers derived from the phenols are prepared by special methods. Ethers containing diatomic radicles are obtained from the mono-haloid derivatives of the dihydric alcohols (glycols) by the action of KHO :—

Compound ethers can be obtained from the sodium derivatives of the glycols by the action of mono-haloid ethers :—

The ethene series of ethers are more active in their chemical behaviour than those containing $\text{C}_n\text{H}_{2n+1}$ radicles.

Ethers corresponding to the first seven normal primary alcohols of the series $\text{C}_n\text{H}_{2n+1} \cdot \text{HO}$ are known. Of these "sulphuric ether" is most frequently met with. It is the oxide of ethyl $(\text{C}_2\text{H}_5)_2\text{O}$, and is prepared by allowing a stream of ethyl alcohol to flow into a mixture of strong sulphuric acid and alcohol kept at a constant temperature of about 140°C . The following reactions occur :—

As will be seen from these equations, a given quantity of H_2SO_4 is theoretically capable of etherifying an unlimited quantity of alcohol; practically, however, a limit is reached. If a mixture of alcohols is employed at starting, a compound ether is produced.

Ethyl ether is a colourless, mobile liquid, but very slightly soluble in water, and possessing an agreeable odour. It boils at 35.5°C . By the action of chlorine it yields substitution derivatives, $\text{C}_2\text{H}_4\text{Cl} \cdot \text{O} \cdot \text{C}_2\text{H}_5$, $(\text{C}_2\text{Cl}_5)_2\text{O}$.

V. SULPHUR, SELENIUM, AND TELLURIUM ALCOHOLS AND ETHERS.

These compounds are the analogues of the alcohols and ethers (see p. 553), and are in many cases prepared by analogous methods. The following are typical reactions :—

Preparation of Sulphur Alcohols.

Preparation of Sulphur, &c., Ethers.

Diethyl telluride is prepared by an analogous reaction, K_2Te being substituted for K_2Se . Polysulphides, $(\text{C}_2\text{H}_5)_2\text{S}_2$, $(\text{C}_2\text{H}_5)_2\text{S}_3$, can be obtained by employing alkaline polysulphides in these reactions. Certain thio-alcohols can be prepared from the corresponding alcohols by the action

¹ The cyanide thus formed unites with AgCN , forming the compound $\text{CH}_3\text{CN} \cdot \text{AgCN}$, which, on treatment with KCN in excess, yields the methyl isocyanide with the formation of $\text{KAg}(\text{CN})_2$.

of phosphorus pentasulphide ($5C_2H_5.HO + P_2S_5 = 5C_2H_5.HS + P_2O_5$). The sulphur analogues of the phenols and dihydric phenols are prepared by a special general method. The sulphonic acid (see p. 561) of the corresponding hydrocarbon is converted into a sulphonic chloride by the action of PCl_5 , and the sulphonic chloride is then acted on by nascent hydrogen:—

The sodium derivatives of these thio-phenols yield compound thio-ethers by the action of haloid ethers:—

Compounds intermediate between alcohols and thio-alcohols are known:—

The compounds of this family are mobile or oily liquids or crystalline solids. Most of them possess characteristic and offensive odours. They are susceptible of the same isomerism as their oxygen analogues. The thio-alcohols combine energetically with alkali metals, and with certain metallic oxides and salts, to form derivatives analogous to the metallic alcohol derivatives,—hence the name *mercaptans* (*corpus mercurio aptum*) sometimes given to these bodies. Certain lead mercaptides, when heated in the dry state, yield the corresponding thio-ethers.

VI. ALDEHYDES.

The relations between these compounds and the primary alcohols are clearly brought out by the mode of formulation adopted for these alcohols (p. 562). Thus:—

It will be seen from these formulæ that aldehydes are derived from alcohols by the elimination of H_2 from the group CH_2OH , i.e., 2 hydrogen atoms are withdrawn from the typical carbon atom, leaving the group (COH) (compare with definition previously given, p. 553); hence the generic name (*alcohol dehydrogenatum*). It is thus possible for any alcohol to furnish an aldehyde, although great numbers of these compounds have yet to be discovered to complete the various series. The following formulæ will illustrate the derivation of aldehydes from polyhydric alcohols:—

The aldehydes of monohydric alcohols are metamerie with the oxides (ethers) of dyad radicles. Thus, ethyl aldehyde, $CH_3.CO.H$, is metamerie with ethene oxide ($C_2H_4.O$); benzoic aldehyde would be metamerie with methyl-phenylene oxide [$C_6H_5.(CH_3)$]. The aldehydes are liable also to the isomerism of their contained hydrocarbon radicles, while aromatic aldehydes of dihydric alcohols are susceptible of the isomerism incident to the relative positions of the COH groups.

By the action of oxidizing agents aldehydes are converted into acids containing the same number of carbon atoms; thus, R' being the monatomic radicle—

Starting, therefore, from the parent hydrocarbons, the primary alcohols are the first results of the introduction of hydroxyl into the methyl group. The next step in oxidation removes the two remaining hydrogen atoms from this group with the formation of aldehydes, and the final result of the oxidation is to convert COH into carboxyl $COOH$, with the formation of acids. Aldehydes thus occupy a position intermediate between alcohols and acids:—

Aldehydes take up nascent hydrogen, reproducing alcohols— $R'.COH + H_2 = R'.CH_2OH$. The acid sulphites of the alkali metals combine directly with aldehydes, forming crystalline compounds, which, on treatment with a mineral acid, yield the aldehyde unaltered.

Aldehydes corresponding to eleven of the primary alcohols of the $C_nH_{2n+1}.HO$ series are known, and are generally prepared by the oxidation of these alcohols: $R'.CH_2OH - H_2 = R'.COH$. The contained C_nH_{2n+1} radicles are in some cases normal primary, and in others iso-primary. The first member, methyl or formic aldehyde, $H.CO.H$, is gaseous; the succeeding terms are liquid, and hexadecyl aldehyde is a crystalline solid. The liquid aldehydes are colourless, transparent, and possessed of pungent ethereal odours; their mobility decreases, and their boiling-points rise as the series is ascended. Their solubility in water decreases in the same manner. By the action of PCl_5 aldehydes lose their oxygen, and Cl_2 is substituted. These chloraldehydes are isomeric with the dichlorides of the olefines, and (with the exception of the ethyl compound), with the chlorides of monochlorinated C_nH_{2n+1} radicles. Thus:—

(See also p. 559.) The aldehydes of the present series combine directly with ammonia, forming *aldehyde-ammonias* of the general formula $R'.C(OH)(NH_2)H$, which, by losing the elements of water, condense into basic substances, termed *aldines* and *oxaldines*. When acted on by chlorine in large excess these aldehydes yield the corresponding chlorides of acid radicles $(R'CO)Cl$. Trichloraldehyde, $CCl_3.CO.H$, or *chloral*, can be obtained by the action of chlorine on ethyl alcohol. The *acetals* are compounds formed by the combination of aldehydes and alcohols of the $C_nH_{2n+1}.HO$ series, with elimination of water. By the action of zinc chloride, &c., acetic aldehyde yields *crotonic aldehyde*: $2C_2H_4O - OH_2 = C_4H_6O$. The aldehydes oxidize with the greatest readiness to the corresponding acids; thus, silver oxide is reduced to the metallic state when heated with an aldehyde and water. A drop of acetic aldehyde let fall on blue litmus paper shows an acid reaction on mere exposure to the air, owing to the formation of acetic acid. Aldehydes are characterized by their extreme readiness to undergo polymeric modification. Thus the presence of a trace of certain reagents converts acetic aldehyde under some conditions into *paraldehyde*, $C_6H_{12}O_3 = 3C_2H_4O$, and under other conditions into *metalddehyde*, $n(C_2H_4O)$.

The aldehydes corresponding to the $C_nH_{2n+1}.HO$ alcohols are *acrylic aldehyde* or *acrolein* $C_3H_3.CO.H$, and *crotonic aldehyde*, previously mentioned. These aldehydes do not yield compounds analogous to aldehyde-ammonia.

Of the aldehydes of the aromatic series mention may be made of *benzoic aldehyde*, which can be obtained from bitter-almond oil; *cumic aldehyde*, existing in oil of cumin; *salicylic aldehyde*, which exists in the flowers of "meadow-sweet;" and *cinnamic aldehyde*, the chief constituent of the oils of cassia and cinnamon. The aromatic aldehydes, by the action of ammonia, are converted into *hydramides* of the general formula $(C_nH_{2n-7}CH)_3N_2$.

VII. KETONES.

These compounds are derived from secondary alcohols, in the same manner that aldehydes are derived from primary alcohols:—

The ketones may thus be regarded as compounds of C_nH_{2n+1} , &c., radicles with CO, or as aldehydes in which the H of the COH group is replaced by such radicles. The compounds of this family bear considerable resemblance to the aldehydes, but are distinguished by their behaviour on oxidation, for whereas the aldehydes are readily converted into acids containing the same number of carbon atoms, the ketones are converted (with some difficulty) into a mixture of two acids of the $C_nH_{2n+1}.COOH$ series, each containing a smaller number of carbon atoms. The law of the oxidation of ketones appears to be that the less complex of the two hydrocarbon radicles remains attached to the CO; thus—

Ketones are converted by the action of nascent hydrogen into secondary alcohols (see p. 563).

The ketones are liable to isomeric modification depending on the isomerism of their contained hydrocarbon radicles.

For example, $CO \left\{ \begin{array}{c} CH_3 \\ C_3H_7 \end{array} \right.$ (methyl propyl ketone) is isomeric with $CO \left\{ \begin{array}{c} CH_3 \\ CH(CH_3)_2 \end{array} \right.$ (methyl-pseudopropyl ketone).

Furthermore, there can be metamerism among ketones owing to the presence of different radicles in the molecule, and every ketone is metameric with an aldehyde of the same series. Thus, the following are metameric:—

Ketones corresponding to the general formulæ $CO(C_nH_{2n+1})_2$, $CO \left\{ \begin{array}{c} C_nH_{2n+1} \\ C_nH_{2n-7} \end{array} \right.$, and $CO(C_nH_{2n-7})_2$ are known, and are formed by various methods, of which the following are the most important:—

1. By the oxidation of secondary alcohols (see beginning of section).

2. By the action of sodium organo-metallic bodies on CO:

3. By the action of zinc organo-metallic compounds on acid chlorides (chlorides of acid radicles):—

4. By the dry distillation of the Ca and Ba salts of monobasic acids of the series $C_nH_{2n+1}.CO_2H$, $C_nH_{2n-7}.CO_2H$, &c.,—

By employing a mixture of the salts of acids belonging

to two different series, or of two different acids belonging to the same series, ketones containing two different radicles are obtained.

The ketones of the series $CO(C_nH_{2n+1})_2$ and $CO \left\{ \begin{array}{c} C_nH_{2n+1} \\ C_nH_{2n-7} \end{array} \right.$ are, with few exceptions, mobile or oily colourless liquids, possessed of most characteristic and penetrating odours; those of the series $CO(C_nH_{2n-7})_2$ are crystalline solids. Ketones containing methyl form with acid sulphites white crystalline compounds, from which the ketone is obtained unaltered on distillation with an alkali. The best known ketone of the series $CO(C_nH_{2n+1})_2$ is *dimethyl-ketone* or *acetone*, $CO(CH_3)_2$, a limpid, inflammable liquid, boiling at $55.5^\circ C.$, and readily miscible with water. In addition to the general modes of formation previously given, this ketone can be obtained by the destructive distillation of citric acid, and also by distilling certain carbohydrates with quicklime. Heated with ammonia, acetone forms *acetonine*, a basic substance, of the formula $(C_3H_6)''N_2$. Of the aromatic ketones *methyl-phenyl ketone* or *acetophenone* is interesting as furnishing, by the action of fuming nitric acid, a nitro-derivative, $CO \left\{ \begin{array}{c} CH_3 \\ C_6H_4(NO_2) \end{array} \right.$, which, when heated with soda-lime and zinc dust, yields *indigotin* or *indigo-blue*—

VIII. ORGANIC ACIDS.

The relationship of the organic acids to the hydrocarbons and to the alcohols has been previously pointed out (pp. 553 and 567). A further development of this relationship, as bearing on the formation of acids from polyhydric alcohols, is shown in the following examples:—

In the formation of acids from alcohols, therefore (disregarding the intermediate formation of aldehydes), one atom of oxygen is substituted for H_2 in the group $CH_2.OH$, thus converting this group into carboxyl, $COOH$.¹ It has been before mentioned that $CH_2.OH$ is derived from methyl by the substitution of HO for H, so that carboxyl may be regarded as a methyl derivative, and a similar view may be extended to cyanogen CN, where N''' may be regarded as replacing H_3 . This connection between CN and $COOH$ is shown by the various reactions in which the one radicle is converted into the other, but more particularly so far as the compounds now under consideration are concerned, by the synthesis of organic acids from the corresponding nitriles (p. 555). A few comparative formulæ will serve to illustrate still further this important relationship:—

¹ "Organic hydroxides are converted into acids, not only by transformation of the group $CH_2.OH$ into $COOH$, but also when negative elements or radicles accumulate near an alcoholic hydroxyl."—Watts's *Dictionary of Chemistry*, second supplement.

with water. Ketones containing C_nH_{2n+1} radicles, when heated with HCN, HCl, and water, produce acids of this group:—

3. *Primary Olefine Acids*, C_nH_{2n} $\left\{ \begin{array}{l} CH_2 \cdot OH \\ CO_2H \end{array} \right.$ —Produced by the oxidation of glycols of the form C_nH_{2n} $\left\{ \begin{array}{l} CH_2 \cdot OH \\ CH_2 \cdot OH \end{array} \right.$.

4. *Secondary Olefine Acids*, C_nH_{2n} $\left\{ \begin{array}{l} CH(C_nH_{2n-1}) \cdot OH \\ CO_2H \end{array} \right.$ —Produced by the action of nascent hydrogen on certain compounds formed by the action of sodium on ethyl acetate, $CH_3 \cdot CO(C_2H_5O)$. (See p. 573.)

The following is a list of the acids of the lactic series:—

Carbonic acid ¹	$HO \cdot CO_2H$
Glycollic „	$CH_2(HO) \cdot CO_2H$
Ethylidene lactic acid	$\left\{ \begin{array}{l} \\ \\ \\ \end{array} \right. \dots C_2H_4(HO) \cdot CO_2H$
Ethylene „	
Paralactic „	
Hydracrylic „	
Oxybutyric acids	$C_3H_6(HO) \cdot CO_2H$
Oxyvaleric „	$C_4H_8(HO) \cdot CO_2H$
Oxycaproic „	$C_5H_{10}(HO) \cdot CO_2H$
Oxyheptylic acid	$C_6H_{12}(HO) \cdot CO_2H$
Oxydodecyllic „	$C_{11}H_{22}(HO) \cdot CO_2H$

Ethylidene lactic acid is the first product of the butyric fermentation of sugar; ethylene and paralactic acids are contained in the juice of flesh. *Lactile* and *dilactic acid* ($C_3H_4O_2$ and $C_6H_{10}O_5$) are produced by the elimination of water from one and two molecules of lactic acid by heat.

Series $C_nH_{2n-1}O \cdot CO_2H$, *Pyruvic Series*.—These acids may be regarded as derived from those of the lactic series by the abstraction of H_2 . The following are known:—

Pyruvic or pyroracemic acid	$C_3H_3O \cdot CO_2H$
Epihydric „	$C_3H_3O \cdot CO_2H$
Acetopropionic „	$C_4H_5O \cdot CO_2H$
Convolvulinoleic „	$C_{12}H_{23}O \cdot CO_2H$
Jalapinoleic „	$C_{15}H_{29}O \cdot CO_2H$
Ricinoleic „	$C_{17}H_{33}O \cdot CO_2H$

Series $C_nH_{2n+1}O_2 \cdot CO_2H$ comprises *glyoxylic* and *glyceric* acids, $CH_3O_2 \cdot CO_2H$ and $C_2H_7O_2 \cdot CO_2H$.

Series $C_nH_{2n-1} \cdot CO_2H$, *Acrylic Series*.—The acids known in this series are the following:—

Acrylic acid	$C_3H_3 \cdot CO_2H$
Crotonic and methacrylic acids	$C_4H_5 \cdot CO_2H$
Angelie and methylecrotonic acids	$C_5H_7 \cdot CO_2H$
Pyroterebic, hydrosorbic, and ethylcrotonic acids	$C_5H_7 \cdot CO_2H$
Moringic and cimicic acids	$C_{14}H_{27} \cdot CO_2H$
Hypogaeic, gaidic, and physetoleic acids	$C_{12}H_{23} \cdot CO_2H$
Oleic and elaidic acids	$C_{17}H_{33} \cdot CO_2H$
Docglic acid	$C_{15}H_{29} \cdot CO_2H$
Brassic and crucic acids	$C_{21}H_{41} \cdot CO_2H$

These acids are produced by the oxidation of the corresponding aldehydes, and also by the dehydration of secondary lactic acids. They may be arranged in two isomeric series:—*primary acids* of the form $CHR'' \cdot CO_2H$, and *secondary acids*, $CR'R'' \cdot CO_2H$. These acids combine directly with Ha_2 , HHa , and are raised to the $C_nH_{2n+1} \cdot CO_2H$ type. On fusion with KHO they yield potassium salts of two fatty acids.

Series $C_nH_{2n-3} \cdot CO_2H$ contains *tetroleic* ($C_3H_3 \cdot CO_2H$), *sorbic* ($C_5H_7 \cdot CO_2H$), and *stearolic* ($C_{17}H_{31} \cdot CO_2H$) acids.

Series $C_nH_{2n-7} \cdot CO_2H$, *Benzoic or Aromatic Series*.—The following are known:—

Benzoic acid	$C_6H_5 \cdot CO_2H$
Toluic acids	$C_7H_7 \cdot CO_2H$
Xylic, hydrocinnamic, mesitylenic, and ethylbenzoic acids	$\left\{ \begin{array}{l} \\ \\ \end{array} \right. \dots C_8H_9 \cdot CO_2H$
Cumic and cumylic acids	$C_9H_{11} \cdot CO_2H$
Homocumic acid	$C_{10}H_{13} \cdot CO_2H$

These acids are prepared by the general methods of oxidizing the corresponding alcohols and aldehydes, and by the action of KHO on the cyanides of the C_nH_{2n-7} radicles. Benzoic acid exists in gum-benzoin, from which it sublimes,

¹ This acid (the hydroxyl derivative of formic acid) is unknown in the free state, and is *dibasic*.

on heating, in white feathery crystals, having a fragrant odour. By the action of Cl, HNO_3 , &c., these acids yield substitution derivatives, such as $C_6H_4Cl \cdot CO_2H$ and $C_6H_4(NO_2) \cdot CO_2H$, chlorobenzoic and nitrobenzoic acids. The latter, by the action of nascent hydrogen, is converted into $C_6H_4(NH_2) \cdot CO_2H$, amidobenzoic acid. *Hippuric acid*, the potassium salt of which occurs in the urine of many herbivorous animals, is *benzamido-acetic acid*—

The aromatic acids can be arranged in two metameric series corresponding to the benzylic alcohols and the phenols.

Series $C_nH_{2n-8}(HO) \cdot CO_2H$, *Oxybenzoic Series*.—This bears to the preceding series the same relationship as the lactic to the fatty series:—

Salicylic (<i>ortho</i>), oxybenzoic (<i>meta</i>), and paraoxybenzoic acids	$C_6H_4(HO) \cdot CO_2H$
Anisic (or oxymethyl-benzoic), cresotic, and mandelic (or formo-benzoic) acids	$C_7H_6(HO) \cdot CO_2H$
Phloretic, hydrocoumaric, hydroparacoumaric and phenyl-lactic acids	$C_8H_8(HO) \cdot CO_2H$
Thymotic and thymyl-carbonic acids	$C_{10}H_{12}(HO) \cdot CO_2H$

Series $C_nH_{2n-9}(HO)_2 \cdot CO_2H$, *Dioxybenzoic Series*, contains *oxysalicylic*, *hypogallic*, *protocatechuic*, and *carbohydroquinonic acids*— $C_6H_3(HO)_2 \cdot CO_2H$.

Allied to this series are *piperic* ($C_{12}H_{10}O_4$) and *eugenic* ($C_{11}H_{12}O_4$) acids.

Series $C_nH_{2n-10}(HO)_3 \cdot CO_2H$, *Gallic Series*.—*Gallic acid*, $C_6H_2(HO)_3 \cdot CO_2H$, exists ready formed in many plants, such as sumach, hellebore, &c. *Tannins* are the astringent vegetable principles made use of in tanning. They all contain some form of *tannic acid*, $C_{12}H_{10}O_{17}$, a compound resolved by the action of acids into gallic acid and glucose (see p. 572). Gallic acid is generally prepared from the gallotannic acid extracted from gall-nuts.

Series $C_nH_{2n-9} \cdot CO_2H$:—*Cinnamic*, *atropic*, and *isatropic acids*, $C_8H_7 \cdot CO_2H$.

Series $C_nH_{2n-10}(HO) \cdot CO_2H$:—*Coumaric* and *paracoumaric acids*, $C_8H_6(HO) \cdot CO_2H$.

Series $C_nH_{2n-11} \cdot CO_2H$:—*Phenyl-propionic acid*,

Series $C_nH_{2n-13} \cdot CO_2H$, comprising two *naphthoic acids*, $C_{10}H_7 \cdot CO_2H$.

Series $C_nH_{2n-14}(HO) \cdot CO_2H$, containing *oxynaphthoic acids*, $C_{10}H_6(HO) \cdot CO_2H$.

Series $C_nH_{2n-16}(HO) \cdot CO_2H$, containing *benzilic acid*,

Series $C_nH_{2n-19} \cdot CO_2H$:—*Anthracenecarbonic acid*,

Dibasic Acids.

Series $C_nH_{2n}(CO_2H)_2$, *Succinic Series*.—The following are known:—

Oxalic acid	$(CO_2H)_2$	Pimelic acid ...	$C_5H_{10}(CO_2H)_2$
Malonic acid ...	$CH_2(CO_2H)_2$	Suberic acid ...	$C_6H_{12}(CO_2H)_2$
Succinic acid ...	$C_2H_4(CO_2H)_2$	Anchoic acid ...	$C_7H_{14}(CO_2H)_2$
Pyrotartaric acid	$C_3H_6(CO_2H)_2$	Sebacic acid ...	$C_8H_{16}(CO_2H)_2$
Adipic acid	$C_4H_8(CO_2H)_2$	Roccellic acid ...	$C_{15}H_{30}(CO_2H)_2$

These acids may be prepared by the general methods of oxidizing the corresponding alcohols (glycols), and from the cyano-olefine compounds, $C_nH_{2n}(CN)_2$, by the usual reactions. Oxalic acid (sodium salt) may be synthesized by heating sodium in dry CO_2 , and is manufactured on the large scale by fusing sawdust with caustic alkalis. This acid, free or combined, is found in many plants,—hence the name (from *Oxalis*, wood-sorrel). Succinic acid exists in amber. Many of these acids are produced by oxidizing various organic substances with nitric acid. The acids of the present series are crystalline solids, forming, like all

dibasic acids, two series of salts, *normal* and *acid*, of the formulæ $C_nH_{2n} \begin{cases} COOH \\ COOM' \end{cases}$ and $C_nH_{2n} \begin{cases} COOM' \\ COOM' \end{cases}$. Isomerides of many of the acids are known. Oxalates may be formed from cyanogen compounds (see p. 554).

Series $C_nH_{2n-1}(HO)(CO_2H)_2$, *Malic Series* :—

Tartronic or oxymalonic acid	$CH(OH)(CO_2H)_2$
Malic or oxysuccinic acid	$C_2H_3(OH)(CO_2H)_2$
Citramalic and glutanic acids	$C_3H_3(OH)(CO_2H)_2$
Oxyadipic acid	$C_4H_3(OH)(CO_2H)_2$
Oxysuberic acid	$C_6H_{11}(HO)(CO_2H)_2$

Malic acid is found free or combined in the juice of most fruits.

Series $C_nH_{2n-2}(HO)_2(CO_2H)_2$, *Tartaric Series*.—The following are known :—

Mesoxalic acid (?)	$C(HO)_2(CO_2H)_2$
Tartaric acid	$C_2H_2(OH)_2(CO_2H)_2$
Homo-, citra-, and ita-tartaric acids...	$C_3H_4(OH)_2(CO_2H)_2$
Dioxyadipic acid	$C_4H_4(OH)_2(CO_2H)_2$
Dioxysuberic	$C_6H_{10}(HO)_2(CO_2H)_2$

Tartaric, like malic and oxalic acids, is of frequent occurrence in the vegetable kingdom, being found free or combined in the juice of many fruits. It is generally obtained from *argol* or *tartar* (crude acid potassium tartrate), which is deposited from fermenting grape juice. It can be formed by the action of Ag_2O and water on dibromsuccinic acid, $C_2H_2Br_2(CO_2H)_2$. Five modifications of tartaric acid, differing chiefly in their optical properties, are known, viz., dextrotartaric, levotartaric, racemic, mesotartaric, and metatartaric acids. Normal and acid tartrates are known. *Tartar emetic* is potassio-antimonious tartrate; the acid potassium tartrate is known as *cream of tartar*.

Series $C_nH_{2n-2}(CO_2H)_2$, *Fumaric Series*.—This consists of *fumaric* and *maleic acids*, $C_4H_2(CO_2H)_2$; *citraconic*, *itaconic*, and *mesaconic acids*, $C_5H_4(CO_2H)_2$.

Series $C_nH_{2n-8}(CO_2H)_2$, *Phthalic Series*, comprises :—

Phthalic (<i>ortho</i> -), isophthalic (<i>meta</i> -), and terephthalic (<i>para</i> -) acids	$C_6H_4(CO_2H)_2$
Uvic or mesidic, xylydic, and isoxylydic acids	$C_7H_4(CO_2H)_2$
Cumidic acid	$C_8H_4(CO_2H)_2$

The phthalic acids are obtained by the oxidation of many aromatic hydrocarbons and their derivatives. Derived from these acids are *hydro-phthalic* and *hydrotere-phthalic acids* ($C_8H_6O_4$).

Tribasic Acids.

Meconic acid, $C_3HO(CO_2H)_3$, is obtained from opium; *tricarballic acid*, $C_3H_5(CO_2H)_3$, from tricyanopropane (see p. 568).

Citric acid, $C_3H_4(OH)(CO_2H)_3$, exists in many fruits, and is generally obtained from lemon juice. It forms colourless crystals readily soluble in water. Being a tribasic acid, it forms with metals three classes of salts, typified by $M'C_6H_7O_7$, $M_2'C_6H_6O_7$, $M_3'C_6H_5O_7$, &c.

Aconitic acid, $C_3H_3(CO_2H)_3$, is derived from citric acid, and is found also in monkshood (*Aconitum Napellus*).

Trimellitic (para-), *trimesic (meta-)*, and *hemimellitic (ortho-) acids*, $C_6H_3(CO_2H)_3$, are tricarboxyl derivatives of benzene.

Tetrabasic and Hexabasic Acids.

The following tetracarboxyl benzene derivatives are known:—*pyromellitic (para-)*, *prehnitic (meta-)*, and *mellophanic (ortho-) acids*, $C_6H_2(CO_2H)_4$.

The hexabasic acids known are *mellitic acid*, $C_6(CO_2H)_6$, and its derivative *hydromellitic acid*, $C_6H_6(CO_2H)_6$.

It is to be remembered that the foregoing list is necessarily brief. Many acids of vegetable and animal origin, and others derived from them by artificial methods, are known, but their constitution is in many cases still undecided.

IX. ANHYDRIDES.

These compounds are the ethers of acid radicles (see p. 553), and may be prepared in many cases by analogous reactions :—

Many anhydrides are obtained by heating the corresponding acids :—

Anhydrides when acted on by water yield the corresponding acids :—

Compound anhydrides when distilled are resolved into two simple anhydrides—

Acetic anhydride is an oily liquid, boiling at 137° , and having a pungent odour. By the action of P_2S_5 it yields *thiacetic anhydride*, $(C_2H_3O)_2S$, and by BaO_2 *acetic peroxide*, $(C_2H_3O)_2O_2$. It combines directly with aldehydes.

X. ACID HALIDES.

These may be regarded as the haloid ethers of acid radicles. They can be prepared by the action of haloid phosphorus compounds on the acids containing the corresponding radicles—

A similar reaction can be effected with the haloid substitution compounds of the acids. Thus, $C_2H_2ClO.Cl$, $C_2HCl_2O.Cl$, and $C_2Cl_3O.Cl$ (mono-, di-, and tri-chloroacetyl chlorides) can be obtained by the action of PCl_3 on mono-, di-, and tri-chloroacetic acids.

The compounds of this family must be distinguished from the haloid salts of the acids which contain the halogen atom in the place of the carboxyl hydrogen; for instance—

The latter compound is a yellow liquid produced by the action of acetic anhydride upon hypochlorous anhydride: $(C_2H_3O)_2O + Cl_2O = 2C_2H_3O.OCl$. It is very unstable, being decomposed by heat, Br, I, and most metals. The corresponding iodine compound produced by the action of iodine on the chlorine acetate is interesting as showing the triad nature of the iodine atom— $[(C_2H_3O)O]_3I'''$.

The acid halides are as a rule colourless liquids more or less oily, and possessing characteristic odours. They are decomposed by water :—

In some cases the whole of the halogen is not removed by the action of cold water :—

Acetyl chloride, when made to act upon potassium hydrosulphide, forms *thiacetic acid* :—

When it is mixed with acetic acid, and acted on by sodium amalgam, the corresponding alcohol is produced :—

Some acid halides can be synthesized from hydrocarbons by the action of carbonyl dichloride (phosgene gas)—

XI. ETHEREAL SALTS.

These compounds are derived from acids by the substitution of hydrocarbon radicles for hydrogen, but it is only the hydrogen entering into the composition of hydroxyl that can be thus replaced. Thus, the number of ethereal salts that any acid can form depends upon the number of times it contains HO; in other words, an *n*-hydric acid can form *n* ethereal salts. It has been previously mentioned that the basicity of an organic acid depends upon the number of times it contains COOH, hence it follows that monohydric acids must be monobasic, but *n*-hydric acids may be 1, 2, 3, *n*-basic. For example, tartaric acid is tetrahydric, but as only two of its hydrogen atoms are replaceable by metals it is dibasic, and consequently contains 2(COOH). But this acid being tetrahydric contains 4(HO), and has thus four hydrogen atoms replaceable by radicles, giving rise to four ethereal salts :—

Ethereal salts are normal or acid according as the carboxyl (basic) hydrogen is entirely or partially replaced by radicles.

Every acid, inorganic and organic, can give rise to the formation of ethereal salts, these being in many cases produced by the direct action of the acid on the alcohol containing the necessary radicle :—

Other methods of preparing ethereal salts are exemplified by the following reactions :—

[In practice this reaction is effected by passing HCl gas into a mixture of the acid and alcohol.]

Most ethereal salts are decomposed on heating with water into an acid and an alcohol. The same reaction is more speedily induced by caustic alkalies :—

The ethereal salts of nitrous acid are metameric with nitro-derivatives of hydrocarbons; thus—

Ethyl nitrite is produced by the action of ethyl sulphuric acid on potassium nitrite. Nitroethane is formed when ethyl iodide acts on silver nitrite. By the action of nascent hydrogen the difference in constitution between these two compounds is well brought out :—

Many ethereal salts exist ready formed in various animal and vegetable substances. Thus, oil of wintergreen (*Gaultheria procumbens*) contains methyl salicylate, $\text{C}_6\text{H}_7(\text{HO}).\text{CO}(\text{OCH}_3)$. The ethereal salts of glycerin (*glycerides*) have received special names :—

(Stearins occur in suet, tallow, and other fats.)

Glucosides are compounds existing in vegetables which by the action of reagents or natural ferments are resolved into glucose and some other compound. Thus *amygdalin*, a crystalline substance from bitter almonds, &c., when decomposed by the action of *synaptase* or *emulsin*, a ferment existing in the plant, is converted into glucose, benzoic aldehyde, and hydrocyanic acid : $\text{C}_{20}\text{H}_{27}\text{NO}_{11} + 2\text{OH}_2 = \text{C}_7\text{H}_6\text{O} + \text{HCN} + 2\text{C}_6\text{H}_{12}\text{O}_6$. Among the more important glucosides are :—

Gallotannic acid ($\text{C}_{27}\text{H}_{22}\text{O}_{17}$), from oak-galls, sumach, &c.
Salicin ($\text{C}_{13}\text{H}_{18}\text{O}_7$), from bark and leaves of poplar and willow.
Esculin ($\text{C}_{21}\text{H}_{24}\text{O}_{13}$), from bark of horse-chestnut, &c.
Glycyrrhizin ($\text{C}_{24}\text{H}_{38}\text{O}_{13}$), from liquorice root.
Quercitrin ($\text{C}_{33}\text{H}_{36}\text{O}_{17}$), from bark of quercitron (*Quercus infectoria*).
Phlorizin ($\text{C}_{21}\text{H}_{24}\text{O}_{10} \cdot 2\text{OH}_2$), from root bark of apple, pear, plum, and cherry.

Many of the vegetable colouring matters employed in dyeing are glucosides. Thus *indican*, from woad (*Isatis tinctoria*), is a colourless substance decomposed by acids into indigo-blue and a glucose-like body (indiglucon) :—

The most valuable tinctorial constituent of madder-root

(*Rubia tinctoria*) is *alizarin* ($C_{14}H_8O_4$), which exists in the root as a glucoside (*rubianic acid*) ($C_{23}H_{23}O_{14}$). When heated with zinc dust alizarin yields *anthracene* ($C_{14}H_{10}$), and conversely, anthracene can be converted into alizarin by first oxidizing it to *anthraquinone* ($C_{14}H_8O_2$), then by treatment with Br or H_2SO_4 , transforming the quinone into dibromanthraquinone or anthraquinone-disulphonic acid, and finally fusing either of these products with caustic alkalis: $C_{14}H_8Br_2O_2 + 2KHO = C_{14}H_8O_4 + 2KBr$. Large quantities of artificial alizarin are thus manufactured.

Vanillin ($C_8H_8O_3$), the odorous principle of vanilla, has also been obtained artificially from *coniferin* ($C_{16}H_{22}O_5$), a glucoside obtained from the cambium of Coniferous trees. This glucoside when heated with water and emulsin is resolved into glucose and a crystalline substance ($C_{10}H_{12}O_3$) which on oxidation is converted into vanillin.

By the action of sodium on ethyl acetate there is produced among other compounds the sodium salt of an acid, $C_6H_{10}O_3$, which is of extreme interest on account of its enabling the ascent of the series of ketones and fatty acids to be effected. Thus:—

The ascent of the fatty acids is more simply explained by considering the first products of the action of Na on ethyl acetate to result from the replacement of the methyl hydrogen by Na. Thus:—

The liberation of the acid from the ethereal salt is effected by the action of KHO, as previously explained.

XII.—ORGANO-METALLIC BODIES.

The constitution of these compounds has been already considered (p. 553); they have to be distinguished from organic compounds containing metals, such as metallic salts of organic acids. In organo-metallic bodies the metal is directly combined with the hydrocarbon radicle, while in organic compounds containing metals the metallic atom is connected with the radicle through the medium of some other element:—

Organo-zinc compounds are prepared by the action of zinc upon the iodides of C_nH_{2n+1} radicles:—

The operation is most rapidly conducted by digesting the iodide with zinc foil coated with copper by previous immersion in a weak solution of cupric sulphate (Gladstone and Tribe). *Zinc ethide*, the first of these compounds obtained by Frankland, is a limpid, mobile liquid boiling at $118^\circ C.$, and spontaneously inflammable.

Organo-compounds of *tin*, *lead*, *mercury*, *bismuth*, *arsenic*, and *antimony* have been prepared by the action of the iodides and bromides of the corresponding radicles on the potassium or sodium alloys of the metals:—

¹ By the action of nascent hydrogen these compounds are converted into ethereal salts of secondary olefine acids of the lactic series (p. 579).

Many organo-metallic bodies are derived from others by simple replacement or by double decomposition:—

In the case of organo-compounds of monad metals prepared by the direct action of the metal on some other body, as in the last reaction, the original compound occurs inseparably in the resulting compound.

The following is a list of the organo-metallic bodies:—

Potassic zinc methide.....	K(CH ₃), Zn(CH ₃) ₂
Potassic zinc ethide.....	K(C ₂ H ₅), Zn(C ₂ H ₅) ₂
Sodic zinc ethide.....	Na(C ₂ H ₅), Zn(C ₂ H ₅) ₂
Lithic zinc ethide.....	Li(C ₂ H ₅), Zn(C ₂ H ₅) ₂
Lithic mercuric ethide.....	Li(C ₂ H ₅), Hg(C ₂ H ₅) ₂
Magnesium ethide.....	Mg(C ₂ H ₅) ₂
Zinc methide.....	Zn(CH ₃) ₂
Zinc ethide.....	Zn(C ₂ H ₅) ₂
Zinc propide.....	Zn(C ₃ H ₇) ₂
Zinc amylide.....	Zn(C ₅ H ₁₁) ₂
Aluminium methide.....	Al(CH ₃) ₃
Aluminium ethide.....	Al(C ₂ H ₅) ₃
Aluminium propide.....	Al(C ₃ H ₇) ₃
Glucinum propide.....	G(C ₃ H ₇) ₂
Mercuric methide.....	Hg(CH ₃) ₂
Mercuric ethide.....	Hg(C ₂ H ₅) ₂
Mercuric propide.....	Hg(C ₃ H ₇) ₂
Mercuric amylide.....	Hg(C ₅ H ₁₁) ₂
Mercuric phenide.....	Hg(C ₆ H ₅) ₂
Mercuric tolylide.....	Hg(C ₇ H ₇) ₂
Mercuric naphthide.....	Hg(C ₁₀ H ₇) ₂
Stannous ethide.....	Sn ₂ (C ₂ H ₅) ₂
Distannic hexethide.....	Sn ₂ (C ₂ H ₅) ₆
Stannic methide.....	Sn(CH ₃) ₄
Stannic ethide.....	Sn(C ₂ H ₅) ₄
Stannic diethyldimethide.....	Sn(C ₂ H ₅) ₂ (CH ₃) ₂
Stannic phenyltriethide.....	Sn(C ₆ H ₅) ₃ (CH ₃) ₃
Stannic iodotripropide.....	Sn(C ₃ H ₇) ₃ I
Plumbic ethide.....	Pb(C ₂ H ₅) ₄

Not many isomerides of the above compounds have as yet been obtained; *zinc pseudopropide* and *mercuric benzylide* (isomeric with the tolylide) are known.

The extreme readiness with which the organo-metallic bodies exchange their hydrocarbon radicles for more negative elements or radicles obviously renders them of particular value in organic synthesis.

The following are further important reactions:—

1. Synthesis of fatty acids by the direct absorption of CO₂ by organo-sodium compounds:—

2. Displacement of halogens, oxygen, (HO), (OC_nH_{2n+1}) &c., by C_nH_{2n+1} radicles (see the preparation of Sn(C₂H₅)₄ from SnCl₄ given above):—

Also, formation of paraffins by action of water on organo-zinc bodies:—

Compounds intermediate between organo-metallic bodies and haloid salts of the metals have been obtained, e.g.—

The action of slow oxidation upon the compounds of this family is shown in the following examples:—

Organo-boron compounds containing boron directly combined with hydrocarbon radicles have been obtained by the aid of zinc methide and ethide:—

Boric ethide has been prepared by an analogous reaction. Boric methide is a gas, and boric ethide a limpid liquid; both are spontaneously inflammable, burning in air with a green-tinted flame. They combine with ammonia forming compounds of the formula $\text{NH}_3 \cdot \text{BR}'_2$.

Organo-silicon compounds are bodies in which carbon is replaced partially or entirely by silicon. Many of these are formed by means of zinc methide and its homologues:—

A large number of these compounds are now known. Their analogy to the carbon compounds will be seen from the following examples:—

XIII. AMINES.

It has been previously stated that amines are derivatives of ammonia or its hydrate and haloid salts (p. 553), hydrogen being partially or entirely replaced by hydrocarbon radicles. Amines built on the type of NH_3 may arise from the replacement of hydrogen in NH_3 , N_2H_5 , or N_3H_5 , thus forming *monamines*, *diamines*, or *triamines*:—

Similarly triamines are formed by replacement of H_3 by R'' .

Each of these groups of amines is further divisible into *primary*, *secondary*, and *tertiary*, according as one-third, two-thirds, or all the hydrogen of ammonia is replaced by hydrocarbon radicles. For example:—

Monamines containing $\text{C}_n\text{H}_{2n+1}$ radicles.—The following are known:—

Primary.	Secondary.
Methylamine..... $\text{N}(\text{CH}_3)\text{H}$	Dimethylamine $\text{N}(\text{CH}_3)_2\text{H}$
Ethylamine..... $\text{N}(\text{C}_2\text{H}_5)\text{H}$	Methyl-ethyl-amine..... $\text{N}(\text{CH}_3)(\text{C}_2\text{H}_5)\text{H}$
Propylamine..... $\text{N}(\text{C}_3\text{H}_7)\text{H}$	Diethylamine..... $\text{N}(\text{C}_2\text{H}_5)_2\text{H}$
Butylamine..... $\text{N}(\text{C}_4\text{H}_9)\text{H}$	Dipropylamine..... $\text{N}(\text{C}_3\text{H}_7)_2\text{H}$
Amylamine..... $\text{N}(\text{C}_5\text{H}_{11})\text{H}$	Dibutylamine..... $\text{N}(\text{C}_4\text{H}_9)_2\text{H}$
Hexylamine..... $\text{N}(\text{C}_6\text{H}_{13})\text{H}$	Ethylamyl-amine..... $\text{N}(\text{C}_2\text{H}_5)(\text{C}_5\text{H}_{11})\text{H}$
Heptylamine..... $\text{N}(\text{C}_7\text{H}_{15})\text{H}$	Diamylamine..... $\text{N}(\text{C}_5\text{H}_{11})_2\text{H}$
Octylamine..... $\text{N}(\text{C}_8\text{H}_{17})\text{H}$	
Nonylamine..... $\text{N}(\text{C}_9\text{H}_{19})\text{H}$	
Tertiary.	
Trimethylamine..... $\text{N}(\text{C}_2\text{H}_5)_3$	
Triethylamine..... $\text{N}(\text{C}_2\text{H}_5)_3$	
Tripropylamine..... $\text{N}(\text{C}_3\text{H}_7)_3$	
Tributylamine..... $\text{N}(\text{C}_4\text{H}_9)_3$	
Triamylamine..... $\text{N}(\text{C}_5\text{H}_{11})_3$	

These amines are produced by the following methods:—

1. By heating the haloid compounds of $\text{C}_n\text{H}_{2n+1}$ radicles with a solution of ammonia in alcohol:—

The resulting compound is formed on the type of the salts of ammonia, and like these bodies is decomposed by fixed alkalis:—

At the same time, according to the proportion of the reagents, the temperature, &c., in the first reaction, more or less of the secondary and tertiary monamines are produced:—

Amines containing different radicles are obtained thus:—

The secondary and tertiary amines are in all these cases liberated by the action of KHO.

2. Cyanic and cyanuric acids (p. 554) form two classes of ethereal salts analogous to the cyanides and isocyanides (p. 555); thus:—

Isocyanates are prepared by distilling ethereo-potassium salts of H_2SO_4 containing the necessary radicles with potassium cyanate: $\text{R}'\text{KSO}_4 + \text{CO}'\text{NK} = \text{CO}'\text{NR}' + \text{K}_2\text{SO}_4$. Isocyanurates are obtained by a similar reaction, substituting potassium cyanurate for cyanate.

Both these classes of ethereal salts furnish primary amines on distillation with caustic alkali:—

3. Nitro-substitution derivatives of the paraffins are reduced by nascent hydrogen, ammonium sulphide, &c., with the formation of amines (see reduction of nitroethane to ethylamine, p. 572).

With the exception of the methylamines (which are gaseous), the amines of the present class are limpid liquids, having powerful ammoniacal odours and highly basic properties, restoring the colour of red litmus, and uniting with acids to form salts analogous to those of ammonium:—

Like ammonium salts, these amines form yellow crystalline double salts when their hydrochlorides are mixed with a solution of platonic chloride. The general formula of these salts (A representing amine) is 2AHCl , PtCl_4 . Tertiary amines unite directly with iodides of $\text{C}_n\text{H}_{2n+1}$ radicles, forming compounds of the type of haloid ammonium salts:—

These compounds do not again furnish the tertiary amine on treatment with KHO , but on heating with Ag_2O and water bodies such as *tetraethylammonium hydroxide*, $\text{N}(\text{C}_2\text{H}_5)_4\text{HO}$, are produced. These bodies are highly caustic bases analogous to ammonium hydroxide, but more like the fixed alkalies in their general behaviour.

The amines of the present group are susceptible of metamerism and isomerism. For example:—

By the action of nitrous acid primary amines are converted into nitrites, which are decomposed on heating, with the formation of the corresponding alcohol:—

The alcohols produced by this reaction are isomeric and not identical with those of the radicle from which the amine is derived in cases where such isomerism is possible.

The action of nascent hydrogen on the nitriles gives rise to the formation of amines:—

The nitriles can be obtained from the alcohols by combining the latter with sulphuric acid, converting the sulpho-acid thus produced into a potassium salt, and distilling this with potassium cyanide (p. 566). By combining all these reactions the homologous series of alcohols can be ascended. To give an illustration:—*Methyl alcohol* is combined with sulphuric acid, and the resulting sulpho-acid converted into potassium methylsulphate. This latter salt is mixed with potassium cyanide and submitted to dry distillation, when methyl cyanide (acetonitrile) is produced; this when acted on by nascent hydrogen is converted into ethylamine, which by the action of nitrous acid is transformed into *ethyl alcohol*. By a similar series of reactions *ethyl alcohol* can be converted into propylamine, which by the action of HNO_2 is converted into *pseudopropyl alcohol*.

Isocyanides or Carbamines.—These compounds, metameric with the cyanides of hydrocarbon radicles (p. 555), may be regarded as formed on the type of ammonium salts; thus (X' representing the acid radicle)—

Most of the reactions made use of in preparing the cyanides give rise to the simultaneous formation of isocyanides (see p. 555); the latter bodies are in excess when the iodides of the radicles are made to act upon silver cyanide. Isocyanides are also obtained by heating primary amines with chloroform and caustic potash:—

This reaction affords a ready means of distinguishing primary amines, as the isocyanides are at once detected, even in the smallest traces, by their powerful and nauseous odours. The carbamines reduce many metallic oxides (such as HgO , Ag_2O , &c.) with the formation of cyanates of the contained hydrocarbon radicles. They possess properties decidedly more basic than their metamerides, com-

bining energetically with acids to form salts. When heated in sealed tubes the isocyanides are partially transformed into the corresponding nitriles.

Monamines containing $\text{C}_n\text{H}_{2n+1}$ radicles are represented by *allylamine*, $\text{N}(\text{C}_3\text{H}_5)\text{H}_2$.

Monamines containing $\text{C}_n\text{H}_{2n-7}$ radicles.—These bases belong to two isomeric series corresponding to the alcohols of the benzyl series and to the phenols. This relationship is exemplified by the following formulæ:—

The following are the more important amines of the present group:—

Primary.

Phenylamine (aniline)	$\text{C}_6\text{H}_5(\text{NH}_2)$
Benzylamine	$\text{C}_6\text{H}_5\text{CH}_2(\text{NH}_2)$
Xylylamine	$\text{C}_6\text{H}_4\text{CH}_2\text{CH}_2(\text{NH}_2)$
Cynylami	$\text{C}_8\text{H}_7(\text{NH}_2)$
Toluidine	$\text{C}_6\text{H}_4(\text{NH}_2)\text{CH}_3$
Xylidine	$\text{C}_6\text{H}_3(\text{NH}_2)(\text{CH}_3)_2$
Cumidine	$\text{C}_9\text{H}_9(\text{NH}_2)(\text{CH}_3)_2$
Cynidine	$\text{C}_8\text{H}_7(\text{NH}_2)(\text{CH}_3)_2$

Secondary.

Dibenzylamine	$(\text{C}_6\text{H}_5)_2(\text{NH})$
Dixylylamine	$(\text{C}_6\text{H}_4)_2(\text{NH})$
Dicynylamine	$(\text{C}_8\text{H}_7)_2(\text{NH})$
Diphenylamine	$(\text{C}_6\text{H}_5)_2(\text{NH})$
.....	$(\text{C}_6\text{H}_5)(\text{C}_6\text{H}_4)(\text{NH})$
.....	$(\text{C}_6\text{H}_5)(\text{CH}_3)(\text{NH})$

Tertiary.

Tribenzylamine	$(\text{C}_6\text{H}_5)_3\text{N}$
Trixylylamine	$(\text{C}_6\text{H}_4)_3\text{N}$
Trieynylamine	$(\text{C}_8\text{H}_7)_3\text{N}$
Triphenylamine	$(\text{C}_6\text{H}_5)_3\text{N}$
Dimethyl-phenylamine	$(\text{C}_6\text{H}_5)(\text{CH}_3)_2\text{N}$
Dimethyltoluidine	$(\text{C}_6\text{H}_4)(\text{CH}_3)_2\text{N}$
.....	$(\text{C}_6\text{H}_3)(\text{CH}_3)_3\text{N}$
.....	$(\text{C}_6\text{H}_3)(\text{CH}_3)_2(\text{CH}_3)\text{N}$

The amines of the benzyl series are obtained by the action of the chlorides of the corresponding radicles on ammonia. Toluidine and its homologues are prepared by reducing the nitro-derivatives of the corresponding hydrocarbons by means of acetic acid and iron (ferrous acetate), ammonium sulphide, &c.:—

These latter amines, which may be regarded as amido-benzene, in which 1, 2, 3, &c., H atoms are replaced by R' , R_2' , R_3' , &c., are susceptible of the isomeric modification dependent on the relative positions of the replaced H atoms. Thus we have—

All these amines are basic colourless liquids, more or less oily, and possessing highly characteristic odours. They combine with acids forming crystalline salts, which are decomposed by caustic alkalies with the liberation of the amine.

Phenylamine or aniline, the first member of the present series of primary amines, may be regarded as the first homologue of both the above isomeric series. It derives its name from the indigo-plant (*Indigofera Anil*), as it was first obtained by distilling indigo with caustic potash. Aniline is found in small quantities in coal-tar oils, but is manufactured on the large scale by reducing nitrobenzene with iron and acetic acid. Aniline is, when pure, a colour-

less, oily liquid, having a peculiar odour; it boils at 182°C ., and solidifies at -8°C . The replacement of the phenylic hydrogen by halogens gradually destroys the basic character of aniline. Thus, chloraniline, $\text{C}_6\text{H}_4\text{Cl}(\text{NH}_2)$, and dichloraniline, $\text{C}_6\text{H}_3\text{Cl}_2(\text{NH}_2)$, form crystalline salts with acids; but trichloraniline, $\text{C}_6\text{H}_2\text{Cl}_3(\text{NH}_2)$, possesses no basic properties. By the action of the iodides of $\text{C}_n\text{H}_{2n+1}$ radicles upon aniline, the amido-hydrogen can be replaced by these radicles, giving rise to the formation of secondary and tertiary monamines containing different radicles, such, for example, as *ethyl-aniline*, $(\text{C}_6\text{H}_5)(\text{C}_2\text{H}_5)\text{NH}$, produced by the action of $\text{C}_2\text{H}_5\text{I}$ upon aniline, and subsequent treatment with KHO ; *ethyl-amyl-aniline*, $(\text{C}_6\text{H}_5)(\text{C}_2\text{H}_5)(\text{C}_5\text{H}_{11})\text{N}$, formed by the action of $\text{C}_5\text{H}_{11}\text{I}$ upon ethyl-aniline, &c. These tertiary amines combine directly with $\text{C}_n\text{H}_{2n+1}\text{I}$, producing stable iodides—

which are not decomposed by KHO , but by the action of Ag_2O and water are converted into alkaline hydroxides, analogous to NH_4HO . It will be seen that the iodides of $\text{C}_n\text{H}_{2n+1}$ radicles can thus be employed to determine whether the amine is primary, secondary, or tertiary. When aniline hydrochloride and methyl alcohol are heated together in a sealed tube, the amido-hydrogen is partially or entirely replaced by methyl, giving rise to the formation of methyl and dimethyl-aniline hydrochlorides. When both atoms of amido-hydrogen have been thus replaced, if the heating is continued the phenylic hydrogen becomes replaced by methyl giving rise to dimethyl-toluidine and its homologues. This interesting intra-molecular substitution was discovered by Hofmann. The nature of the transformation will be seen from the following formulæ:—

(The last atom of phenylic hydrogen does not appear to be removed by this reaction.)

Nitrous acid acts upon aniline in a manner similar to its action upon the $\text{C}_n\text{H}_{2n+1}$ primary monamines, converting it into the corresponding alcohol (phenol):—

If the aniline is diluted with alcohol, however, intermediate products are formed—

If salts of aniline are employed, salts of these azo-derivatives are produced.

Aniline combines with aldehydes with the elimination of water, producing *phenaldines*:—

Paraniline a polymeride of aniline, having the composition $\text{C}_{12}\text{H}_{14}\text{N}_2$, is known.

Allied to the present group of amines is *naphthalidine*, $\text{C}_{10}\text{H}_7(\text{NH}_2)$, produced by the reduction of uironaphthalene.

Natural Alkaloids.—These compounds are organic bases existing already formed in plants. With the exception of *piperidine* ($\text{C}_5\text{H}_{11}\text{N}$) and *conine*, which are secondary monamines, the alkaloids at present known are tertiary compounds. The following are some of the more important of this group of amines:—

From the bark of species of Cinchona.

From Opium.

From various Plants.

The constitution of the radicles contained in these various bases has not hitherto been made clear. Among the cinchona alkaloids—of which the valuable medicine quinine is a member—some interesting cases of physical isomerism occur. Many bases have been obtained by the action of reagents on the opium alkaloids. A base isomeric with conine has been prepared artificially by heating normal butyl aldehyde with an alcoholic solution of ammonia so as to produce *dibutylaldine*: $2\text{C}_4\text{H}_7\text{COH} + \text{NH}_3 - \text{OH}_2 = \text{C}_8\text{H}_{17}\text{NO}$, and then submitting this latter substance to dry distillation: $\text{C}_8\text{H}_{17}\text{NO} - \text{OH}_2 = \text{C}_8\text{H}_{15}\text{N}$.

Bases from various Sources.—The following are a few bases of animal origin:—

Many bases have been obtained by the destructive distillation of organic matter containing nitrogen. These compounds are tertiary monamines:—

Others are derived from oil produced by the destructive distillation of bones, &c., and coal-tar naphtha:—

Hydramides (p. 568), when boiled with potash solution, are converted into basic compounds. *Amarine*, $\text{C}_{21}\text{H}_{13}\text{N}_2$, is a substance formed in this manner from hydrobenzamide.

Diamines are formed by reactions analogous to those employed in the preparation of monamines:—

As in the preparation of monamines, secondary diamines are at the same time formed:—

The action of KHO upon the primary diamine dihydrobromide is different from its action upon the corresponding monamine compound, inasmuch as an oxide of the diamine is formed:—

The diamines corresponding to benzene and its homologues are produced by the reduction of the dinitro-derivatives of the respective hydrocarbons:—

Intermediate products are sometimes formed—

The diamines have not been investigated with the amount of detail that has been bestowed upon the monamines. By the action of the iodides of $\text{C}_n\text{H}_{2n+1}$ radicles upon ethene and diethene diamines a large number of bases have been obtained, in which the ammonie hydrogen is more or less replaced by these radicles. Diamines form two classes of salts, monacid and diacid.

Triamines.—The following belong to this class:—

Aniline Colours.—A large number of the colours obtained from aniline are triamines, and may be conveniently referred to here. *Rosaniline* (magenta or fuchsine) is the base of a splendid red dye which serves as the starting point of numerous other colours. It is prepared by oxidizing a mixture of aniline and toluidine with arsenic acid:— $\text{C}_6\text{H}_7\text{N} + 2\text{C}_7\text{H}_9\text{N} - 3\text{H}_2 = \text{C}_{20}\text{H}_{19}\text{N}_3$ (*Rosaniline*). *Mauve* is a purple dye produced by the oxidation of aniline by means of sulphuric acid and potassium dichromate. The base of this colour is *mauveine* ($\text{C}_{26}\text{H}_{21}\text{N}_4$), and it is interesting as being the first of the aniline dyes practically employed in the arts.

The numerous other dyes derived from benzene, phenol, and naphthalene cannot be discussed here.

It has been recently observed by Dr Otto Witt that the peculiar properties of organic colouring substances are in most cases due to the combined presence of two groups or radicles attached to a carbon nucleus. The one which is the colour-producing group is termed the *chromophore*, the other is a salt-forming group, *i.e.*, a group which confers upon a molecule either acidity or basicity. A substance containing a chromophore does not become a colour until the salt-forming group is introduced into the molecule; such potential colouring matters are therefore termed *chromogens*. The chromophoric group exercises its influence more powerfully in the salts of colouring substances. The principal salt-forming groups combined with aromatic nuclei are HO and NH_2 , so that most chromogens of this class give rise to two colours according as one or other of the foregoing radicles enters into their composition.

Phosphines, Arsines, Stibines, and Bismuthines.

These compounds are analogues of the amines, and contain the above elements in place of nitrogen. Some of the methods employed in their production are seen in the following reactions:—

The corresponding tertiary stibines and bismuthines are produced by a similar reaction.

The compounds of the presen group are possessed of great affinity for oxygen, many of them taking fire spontaneously when exposed to the air. *Arsendimethyl* or *cacodyl*, $\text{As}_2(\text{CH}_3)_4$, is a spontaneously inflammable liquid, having a most repulsive odour, produced by the action of methyl iodide on sodium arsenic alloy, or by distilling a mixture of potassium acetate and arsenious anhydride. The analogy between these compounds and the amines is still further exemplified by the following reactions:—

XIV. AMIDES.

The compounds of this class are most conveniently regarded as derived from acids by the substitution of NH_2 for the HO contained in the carboxyl group. It will be thus evident that monobasic acids can yield only one amide—a *monamide* of the form $\text{R}'\text{CO}(\text{NH}_2)$. Polybasic acids, on the other hand, can have their hydroxyl partially or entirely replaced by amidogen, thus yielding normal and acid amides. The latter are known as *amic acids*:—

Amides are primary, secondary, or tertiary, according as one-third, two-thirds, or all the hydrogen of the ammonia is replaced by acid radicles (see p. 574).

Amides are produced—(1.) By distilling the normal ammonium salts of the corresponding acids:—

(2.) Also by the action of ammonia on the acid halides:—

By the further action of the acid halide upon the primary monamide secondary and tertiary monamides are produced:—

Diacetamide is also formed by the action of dry HCl upon acetamide and triacetamide by heating acetonitrile (methyl cyanide) with acetic anhydride.

The formation of amides containing dyad radicles is exemplified by the equation—

(3.) Amides are formed by the action of ammonia on the ethereal salts of the corresponding acids:—

CHEMNITZ, a town of the kingdom of Saxony, in the circle of Zwickau, 50 miles W.S.W. of Dresden by rail, in a beautiful plain at the foot of the Erzgebirge, watered by the River Chemnitz, an affluent of the Mulde. It is the first manufacturing town in the country, and in population ranks next to Dresden and Leipsic. Though in general well built and possessing a large number of handsome edifices, it has comparatively few of special interest; among the most important are St. James's church, the ancient town-house, the post-office, the theatre, the new realschule, and the exchange. It contains a Roman Catholic and five Protestant churches, and has three civic schools, a gymnasium, a royal industrial school, of great repute throughout Saxony, a school of practical designing, and an extensive Sunday school under the direction of the workmen's union. It is the seat of several large administrative offices, and a chamber of commerce and industry; and among its societies are two scholastic associations, a merchants' union, a scientific association, and an architectural and artistic society. The cotton goods, and especially the stockings, for which it is mainly celebrated, rival those of England in quality and cheapness; and it is also famous for the manufacture of spinning-machinery. There are nineteen distinct establishments for the weaving of woollen and half-woollen cloth; and 3400 hand-looms are engaged in the same trade. The stocking weaving is prosecuted by sixty-three firms, partly in regular factories and partly by the domestic system. The dye-works number thirty-three, the print-works eight, the bleach-works six, and the chemical works six. There are about eighty establishments for engineering operations, one of which, founded about 1844 by Richard Hartmann, employs 4000 workmen, and manufactures steam-engines of all descriptions, mining and boring apparatus, boilers, and a great variety of implements. The export trade is, of course, very extensive; and in 1871 the value of the goods despatched to America alone amounted to \$4,500,000. There is abundant railway communication in all directions. The population in 1849 was 30,753; in 1864, 54,875; and in 1871, 70,380. In the last of these years it was found that, with the exception of about 1800 Roman Catholics, 380 German Catholics, 48 Jews, and a few dissenters, the people were all Protestants.

Chemnitz was originally a settlement of the Sorbian Wends, which received its first Christian Church from Otto I. in 938. In the 12th century it obtained municipal rights from Lorraine II., and from the 13th to the 17th century it ranked as an imperial city. From its very commencement its prosperity was due mainly to its manufacturing industry, the nucleus of which seems to have been the linen-weaving of the Wends. To this were added extensive bleaching and woollen cloth establishments, which raised the town to great importance in the 15th century. In 1539 the Reformation was introduced, and 1546 saw the dissolution of the great Benedictine monastery which had been founded in 1125 by Lorraine at Schloss Chemnitz, about 2 miles north of the city. In the Thirty Years' War the city was plundered by both Swedes and Imperialists, and its trade was almost completely ruined. By the close of the century, however, it began to recover, chiefly through the introduction of cotton-weaving, which as early as 1730 employed 2000 looms. In 1775 the English quilt manufacture was commenced, and in 1799 the Arkwright system of cotton-weaving. After the peace of Paris there was another period of decay; but a revival set in about 1834 when Saxony joined the customs union. The cotton manufacture suffered considerably during the American Civil War, but by no means so severely as in the English towns.

CHEMNITZ, MARTIN (1522-1586), probably the ablest Lutheran theologian of the period immediately succeeding

that of Luther himself, was born at Treuenbritten in the mark of Brandenburg, on the 9th November 1522. His father, though of noble rank, was in somewhat straitened circumstances, and Martin's education was frequently interrupted owing to pecuniary difficulties. In the fourteenth year he was sent to school at Wittenberg, where he had frequent opportunities of hearing Luther preach. He studied at the universities of Magdurg (1539-42), Frankfurt-on-the-Oder (1543), and Wittenberg (1545), devoting himself specially at the last of these under the advice of Melancthon, to mathematics and astrology. In 1547 he removed to Königsberg, where he was appointed in the following year rector of the cathedral school, and two years later (1550) librarian to Duke Albert of Prussia, whose patronage he had gained through his acquaintance with astrology. It was during his residence in Königsberg that Chemnitz first turned his attention seriously to theology, and that he first had an opportunity, in the celebrated controversy with Osiander on the doctrine of justification by faith, of displaying the polemical ability in which he was scarcely surpassed by the greatest of the Reformers. Osiander, who assailed the forensic and objective element in the Lutheran doctrine, was favoured by Duke Albert, and, as the controversy increased in intensity, Chemnitz judged it expedient to resign his post of librarian and leave Königsberg. In 1553 he returned to Wittenberg, and immediately commenced to deliver lectures at the university on the *Loci Communes* of Melancthon. These formed the basis of his *Loci Theologici* (Frankfurt, 1591), a work which furnishes one of the best existing expositions of the Lutheran theology, as formulated and modified by Melancthon. His audience was from the first exceptionally large, and a career of great influence seemed open to him at the university, when he was induced to make another change by accepting the office of pastor to the church in Brunswick, to which he removed in 1554. In this position he spent the remainder of his life, though he received numerous offers of important offices from various Protestant princes of Germany. He was unusually active in the duties of his charge, and he also took a leading part in the theological controversies of the time, always representing and defending strictly Lutheran views. In fact, it is in no small degree to his personal influence, exerted as it was at the critical period of its history, that the Lutheran Church owed the purity of its doctrine and the compactness of its organization. Against the Crypto-Calvinists he maintained the Lutheran doctrine of the Lord's Supper in a treatise *Repositio sane doctrine de vera Presentia Corporis et Sanguinis Domini in Cena Sacra* (1560, translated into German 1561). Against the Jesuits, on the other hand, he wrote some works of great power, which probably did a good deal to check the reaction from Lutheranism that seemed to be setting in. Chief of these were the *Theologia Jesuitarum praecipua Capita* (1562), a very incisive attack on the principles of the order, and his *Examen Concilii Tridentini*, in four parts, published at intervals (1565, 1566, 1572, and 1573). The latter is undoubtedly Chemnitz's greatest work. Roman Catholics themselves have not been slow to acknowledge its ability, and it may be questioned whether to this day anti-Tridentine literature can show anything more thorough or more acute. In conjunction with Merlin, Chemnitz compiled the *Corpus Doctrinae Protestanticae* (1567), a doctrinal work, which at once acquired great authority. Perhaps his chief service to the organization of the church was rendered when, in conjunction with Andrea and Selmecker, he induced the Lutherans of Saxony and Swabia to adopt the *Formula Concordiae*, and so become one body. In the protracted negotiations which led to this result his learning and tact were of the greatest value.

Chemnitz resigned office owing to infirm health in 1584, and died at Brunswick on the 8th April 1586. A very full account of his life by Schenkel is given in Herzog's *Real-Encyclopædie*.

CHÉNIER, ANDRÉ-MARIE DE (1762–1794), French poet, was born at Constantinople, where his father, Louis de Chénier, author of several works on Oriental history, was consul-general. Sent in infancy to France, he lived till his ninth year at Carcassonne, under care of a paternal aunt; and in 1773, on his father's return, he was placed at the Parisian Collège de Navarre. At sixteen he was rhyming from Sappho and reading the Greek authors. At twenty (1782) he obtained a sub-lieutenancy in the regiment of Angoumois, then in garrison at Strasburg. He left Paris, and reported himself at headquarters. But military life had no charm for him, and neither the neighbourhood of Brunck, whose *Analecta* was one of his favourite books, nor the classic tradition of the Alsatian capital, could bind him to his calling; in six months he threw up his commission and returned to Paris. There he studied hard, and wrote idylls (*Le Mendiant*, *L'Aveugle*, *Le Jeune Malade*); he sketched out plans of great poems; he sat and talked with Palissot, David, and Pindar-Lebrun. A serious illness was induced by excess of work; to complete his recovery he set out, in company with the brothers Trudaine, towards the end of 1784, for Switzerland, Italy, and the Archipelago. In 1786 he returned to Paris, plunged into study anew, and conceived the passion for Madame de Bonneuil which inspired so many of the perfect elegiacs afterwards to win regard and imitation from Hugo himself.

He was five-and-twenty, and at heart a Greek. The Idyllists and Anthologists were his masters. From their styles did he compound his own; and from them did he learn the exquisite purity of form, the admirable restraint, the chastened vigour of thought and diction, that render him pre-eminent among modern poets. And with the *Mélèges* and *Art d'Aimer*, which are the purely subjective fruit of this part of his life, he prepared the plans for other and greater structures. In *L'Invention*, a completed poem, he promulgated a noble theory of æsthetics; in the *Hermès*, an incomparable fragment, he made himself the Lucretius of his epoch; in *Suzanne*, which remains a mere *canon*, he purposed to deal in the style of Milton with a biblical episode. A few only of his friends were admitted to his feast of poesy; and he continued for some time to work and wait. But his family were anxious that he should settle in life, and a secretaryship in the French Legation at London was offered him. It cost him much to accept it, as his fine idyll *La Liberté* remains to prove; but in the December of 1787 he left for England.

His residence beyond sea was unhappy enough. The duties of his place occupied him scarcely at all; and among English poets he cared only for Milton, the purely intellectual quality of whose verse seems to have been peculiarly grateful to him. In 1790 he resigned his post, and returned to France. The Revolution was in full coil; and Chénier, who worshipped liberty and loathed anarchy, threw in his lot at once with the moderate party. Introduced into the brilliant "Société de '89," he drew up for it a manifesto of principles (*AVIS AUX FRANÇAIS SUR LEURS VÉRITABLES INTÉRÊTS*), which, moderate in substance and aggressive in form, gained him the honours of a translation into Polish, together with a medal from King Stanislas, and brought down upon him, through the *Révolution de France et de Brabant*, the wrath of Camille Desmoulins. In 1791 he addressed to David the painter his *Dithyrambe sur le Jeu de Paume*—one of the most Pindaric of modern odes; he was defeated in his candidature for a seat in the National Assembly; and in 1792 an invective against the jacobins, published in the *Journal de Paris*, involved him

in a quarrel with his brother, Joseph Chénier, whom he was afterwards to defend against the attacks of Burke. This dispute was followed by his Archilocheian iambics, *Sur les Suisses Révoltés du Régiment de Châteauneuf*. The Tenth of August, in ruining the hopes of monarchy, ended his chances of political success, and he resolved to retire from the arena, and devote himself wholly to art. The trial of Louis XVI. brought him, however, once more to the front; he assisted in preparing the defence, the responsibility of which he offered to share with Malesherbes; and he drew up an appeal to the people which was rejected in favour of the letter afterwards printed in the *Monteur*. He was broken in health and spirits; Paris was dangerous; he went to Rouen and to Versailles. At the latter place he wrote the poems to "Fanny" and the *À Versailles*, so highly praised and subtly analyzed by Sainte-Beuve.

But he had never ceased to oppose and to stigmatize the action of the Jacobin section, and his mind was turned toward the inevitable end. It came at last. At Paris (6th January 1794) his opposition to the arrest of a Madame de Pastoret, with whom he was staying, led to his own seizure and to his incarceration in the Saint-Lazare. A seizure of some months ensued; he wrote for Mademoiselle de Coigny, duchess of Fleury, the beautiful elegy, *La Jeune Captive*, and for the Convention the furious iambics so often read and quoted. At the tribunal he appeared with forty-four others; thirty-eight were condemned to death. On the morrow (25th July 1794) with Roucher the poet, Trenck, and the Counts de Montalembert and de Créquy, André Chénier was taken to death. As he descended the Conciergerie steps he said to Roucher, "*Je n'ai rien fait pour la postérité. Pourtant* (striking his forehead) *j'avais quelque chose là.*" According to Henri de Latouche, Roucher and Chénier, as the tumbrel rolled scaffoldwards, repeated to each other the first scene of the *Andromaque*; another account represents Roucher as noisily valiant, while Chénier was mute and thoughtful. Three days afterwards, in the same place, Robespierre and his fellows were executed, and the Terror was at an end.

The poems of André Chénier, with the exception of the *Dithyrambe* and the *Ode to Charlotte Corday*, both of which saw light during his life, remained unedited for five-and-twenty years. A selection from his manuscripts was published at last, with retouches, by Henri de Latouche, the novelist and journalist. The moment was opportune: young France was in revolt against the bastard classicism of the great century, and Chénier became a force in modern letters. Sainte-Beuve has compared his influence over the poets of the romantic movement of the second Renaissance—an influence that restrains and chastens—to that of Ingres over its painters. His greatest excellence now is one of form; and this is said entirely without prejudice as to his matter. His sympathy with Milton is a striking fact in his intellectual character, and one that will help not a little to a just appreciation of his poetical qualities. To the English reader, conscious and mindful of the roiling majesty of the Miltonic harmonies, the verse of Chénier, always vigorous and declamatory, often splendid and stately, sometimes passionate and lyrical, may seem ineffectual enough. To his countrymen it is otherwise: "*Une plûte de buis, un archet d'or, une lyre d'ivoire,*" says Sainte-Beuve "*le beau pur, en un mot, voilà André Chénier.*"

See Sainte-Beuve, *Critiques et Portraits*, tome ii.; *Tableau de la poésie française*; Beeq de Fouquières, *Documents nouveaux sur André Chénier*; *Œuvres en prose d'André Chénier*, Paris, 1840. An edition of the poems in one volume forms part of the Bibliothèque Charpentier; a second, in three volumes, was published by Beeq de Fouquières, 1862; a third, also in three volumes, is included in Leconte's valuable series of reprints. (W. L. H.)

CHÉNIER, MARIE-JOSEPH DE (1764–1811), poet and dramatist, was a younger brother of André Chénier, and

like him, was born at Constantinople, reared at Carcassonne, and educated at the Collège de Navarre. Entering the army at seventeen, he left it soon afterwards; and at twenty he produced *Azémière*, a tragedy, which had a languid sort of success. His next venture, *Charles IX.*, which commenced the renown of Talma, excited an extraordinary enthusiasm (1789), and still keeps the stage. In 1791 appeared *Henri VIII.* and *Calas*, with the performance of the first of which the Théâtre de la République was solemnly inaugurated; in 1792 he produced his *Caius Gracchus*, which was proscribed and burned at the instance of Albitte for an anti-aarchical hemistich (*Des lois et non du sang!*); and in 1793 his *Timoléon*, set in Méhul's music, was also proscribed. His brother's death on the scaffold is supposed to have diverted him from the theatre; and only once again, in 1804, with his unsuccessful *Cyrus*, did he attempt the scene. Long a prominent member of the Jacobins' Club, Joseph Chénier was one of the busiest of literary politicians, one of the most prolific of political poets. He was a member of the Convention and of the Council of Five Hundred, over both of which he presided; he had a seat in the Tribunate; he belonged to the Committees of Public Instruction, of General Security, and of Public Safety. In 1801 he was one of the educational jury for the Seine; from 1803 to 1806 he was inspector-general of public instruction. In 1806 and 1807 he delivered a course of lectures at the Athénée on the language and literature of France from the earliest years; and in 1808, at the emperor's request, he prepared his *Tableau historique de l'état et du progrès de la littérature française*—a work, reprinted so late as 1862, in which he shows to great advantage, as a writer, as a critic, as a man. He died January 10, 1811. The list of his works is too long for quotation; a glance at them will indicate his industry and the suppleness and strength of his talent. He wrote hymns and national songs—among others, the famous *Chant du Départ*; odes—*Sur la Mort de Mirabeau*, *Sur l'Oligarchie de Robespierre*, &c.; tragedies, which never reached the stage—*Brutus et Cassius*, *Philippe Deux*, *Tibère*; translations from Sophocles and Lessing, from Gray and Horace, from Tacitus and Aristotle; with elegies, dithyrambs, and Ossianic rhapsodies. As a satirist he is said to possess great merit—see *La Calomnie* (1797) and the *Épître à Voltaire* (1806)—though he sins from an excess of severity, and is sometimes malignant and unjust.

See *Œuvres Complètes de Joseph Chénier*, 8 vols., Paris, 1823-1826; *Poésies*, Paris (Charpentier) 1844; *Chefs-d'œuvre des Auteurs Tragiques*, vol. ii.

CHEOPS, the name of an Egyptian king *Khufu*, called Cheops by Herodotus, Chembes by Diodorus, Souphis by Manetho, and Saophis by Eratosthenes. He was the second king of the fourth dynasty of Manetho, and the builder of the Great Pyramid at Gizeh, 120 stadia distant from Memphis and about 45 from the Nile. According to Diodorus, each side was 7 plethra long, and the height 6 plethra; or according to Herodotus, each side of the base was 8 plethra in extent, and the height the same. The former sides are supposed to have been each 764 feet long, their present dimensions being about 746 feet, while the actual present height is 450 feet, and the angle of the casing stones $51^{\circ} 50'$, according to the measurements of Perring. This wonder of the ancient world, the sepulchre of the monarch, was constructed at great expense and suffering, 100,000 men, changed every three months, being employed by forced labour ten years in constructing the causeway by which the blocks of stone were transported from the Tourah quarries, in the Arabian chain, to a quay on the banks of the Nile, where they were transported by boat from the other bank. Immense expense was entailed in the execution of this costly sepulchre, and according to a popular but

improbable tradition, Cheops was compelled through want of money to sacrifice the honour of his daughter to complete the task. Other popular tales, according to the gloss or extract of Manetho, depicted him as impious towards the gods, closing the temples and stopping the worship, but subsequently repenting, and writing a sacred book much esteemed by the Egyptians. His name was supposed to mean wealthy, or having much hair. The monumental information about Cheops does not confirm the Greek historians; on the contrary, it records the construction of temples in honour of the gods, the repair of the shrine and the gift of various figures of the temple of Isis and Athor close to his own pyramid, and his construction or repairs of the temple of the same goddess Athor, the Egyptian Venus, at Denderah or Tentyris. The sacred book may have been part of the Egyptian rituals, portions of which were attributed to the early kings of Egypt, and a medical papyrus records the discovery in his reign of a treatise on medicine in a temple of a goddess at the town of Debmnt. Cheops carried on war at the Wady Magarah in the Peninsula of Sinai in Arabia, and a rock tablet represents him having conquered the hostile tribes in the presence of the god Thoth, who had revealed the mines of the locality. His oppression had so afflicted Egypt that the charges of impiety had attached to his name; but the tombs of his children reveal no change in the established religion, and his pyramid only differs from those of his predecessors and immediate successor by its rather larger size and greater beauty. His name Khufu, sometimes with the addition of that of the god Khnum as Khnum-Khufu, has been found on several monuments, and was found scrawled on the stones from the quarries of Tourah or the Mons Troicus employed in the so-called chambers of construction of the Great Pyramid. There is no known monument with the date of a regnal year of this monarch, so that it is uncertain if he reigned the sixty-three years attributed to him by Manetho, or the twenty-nine assigned by Eratosthenes. It is just possible, from fragment 30 of the Papyrus of Turin, that he may have lived ninety-five years and reigned the higher number, as generally recognized by Egyptologists. The date of Cheops according to Lepsius is 3095-3032 B.C., but great difference of opinion, amounting to nearly 2000 years, exists as to the time of Menes, from whom the lists separate him by the interval of 898 years. Priests of the Apis and Mnevis bulls are mentioned in the tombs of his period. (Herodotus, ii. 124; Diodorus, i. 64; De Rougé, *Recherches*, pp. 52, 54; Mariette, *Monuments de Boulag*, pp. 207-209, Birch, in *Zeitschrift f. ägyptische Sprache*, 1871, pp. 61-64; Dnemichen, *Bauurkunde*, pl. xvi., a, b; Lepsius, *Denkm.*, ii. 2.)

CHEPHREN, an Egyptian monarch, called in the hieroglyphs Khafra, by Herodotus Chephren, by Diodorus Cephren or Chabrias, by Manetho Souphis II., and by Eratosthenes Saophis II. He was, according to the legends, the son or brother of Cheops, and acted in the same tyrannical manner. Chephren built the second of the great pyramids at Gizeh close to the Sphinx and the Great Pyramid, and was said to be hated like his brother, his mummy not buried in the sepulchre but torn to pieces, and the sarcophagi emptied of their contents. The present length of the base of this pyramid is 690 feet 9 inches, and its perpendicular height 447 feet 6 inches, its angle $52^{\circ} 20'$, but it is not built with the same care. The wife of Chephren, named Merisankh, was priestess of the god Thoth, and Kheman another prince of the family, priest of Thoth at Hermopolis. There is no reason for believing in the impiety of the monarch, or any oppression more than in the case of his predecessors and successor, all whose tombs were pyramids. Chephren also built the small temple behind the great Sphinx, but does not appear

amongst the monarchs recorded at the Wady Magarah. The lists of Abydos interpose a king called Ra-tatef or Tatefra, between Cheops and Chephren, but his reign was probably short and insignificant, and he may have been the brother of Cheops. According to Herodotus, Chephren reigned 50, according to Manetho 66, and according to Eratosthenes 27 years, the longest time being probably correct. From fragment 30 of the hieratic canon of Turin it is probable that he lived 95 years, and his reign, according to Lepsius, was from 3032-2966 B.C. A splendid dioritic statue of Chephren is in the museum of Boulaq, and others, broken and thrown long ago into the well of the temple near the Sphinx, supposed to have been destroyed by popular hatred with the remains of the tombs of his family in the Gizeh cemeteries, are the principal monuments of his reign. It is just possible a bull Apis was buried in his pyramid. (Herodotus, ii. 127, 128; Diodorus, ii. 64; Maspero, *Fragment d'un commentaire sur le second livre d'Herodote*, pp. 4-7; De Rougé, *Recherches*, pp. 52, 54, 62-64; Mariette, *Lettre à M. De Rougé*, p. 7; Lepsius, *Auswahl*, taf. iii).

CHEPSTOW, a market-town and river-port of England, in the county of Monmouth, on the Wye, 2 miles from its junction with the Severn, and 135 miles from London. It occupies the slope of a hill on the western bank of the river, and is environed by scenery of much beauty and grandeur. The town is generally well built, and the streets are broad and clean. The church, originally the conventual chapel of a Benedictine priory of Norman erection, was restored to its former dimensions by the rebuilding of the chancel and transepts in the beginning of the present century. The western entrance and some other parts are richly decorated, and the interior contains many interesting monuments. The castle, founded in the 11th century by W. Fitz-Osborn, earl of Hereford, and almost wholly rebuilt in the 13th, is still a magnificent pile. It stands on the summit of a cliff which is washed by the Wye, and occupies about 3 acres of ground. The river is crossed by a fine iron bridge of five arches, erected in 1816, which has a total length of 532 feet and a span in the middle of 112 feet. There is free passage for large vessels as far as the bridge; but barges of from 18 to 30 tons can ascend as far as Hereford. From the narrowness and depth of the channel the tide rises suddenly, and to a great height, frequently above 50, and it is said even to 70 feet, forming a dangerous bore. There are no manufactures, but the trade is considerable. The exports are timber, bark, iron, coal, cider, and millstones. Population in 1851, 4295, and in 1871, 3347.

CHEQUE. "A check on a banker," says Mr Justice Byles, "is in legal effect an inland bill of exchange drawn on a banker payable to bearer on demand. A check is consequently subject in general to the rules which regulate the rights and liabilities of parties to bills of exchange." Commercial usage has, however, imposed on cheques certain qualities which do not attach to other bills of exchange.

Before 1858 cheques were not subject to the stamp duties imposed on bills in general, if they complied with the following conditions, viz., to have been drawn on a banker, to have specified truly the place of drawing (which must have been within 75 miles from the banker's place of business), to have been payable to bearer on demand, not to have been post-dated, and not to have declared payment to be made in bills or notes. Severe penalties were imposed on persons making or receiving unstamped cheques not falling under this exemption. In 1858 a stamp duty of a penny was imposed on all cheques, and the restrictions as to place of drawing, post-dating, &c., abolished. Another restriction making cheques good for sums under twenty shillings is also abolished.

Although a drawee of a bill is not usually liable thereon until acceptance, a banker having effects belonging to his customer is bound to pay his customer's cheques within a reasonable time. There is what is called an implied contract that the banker should do so, and if it is broken the customer may recover damages. The rule as to presentment of bills within a reasonable time (*i.e.*, in general the day after issue) applies to cheques, but a drawer is not relieved by the holder's negligence in presenting unless he has been injured thereby, as for example by the failure of the banker in the interval. The habit of crossing cheques with the name of some banker is believed to have been originally intended as a direction to drawees to pay only to the bankers so named, but it was held at law that such crossing amounted only to a direction to pay to *some* banker. The words "and Co.," the name of the particular banker being left out, have the same effect. Payment of a crossed cheque otherwise than through a banker was at common law evidence of negligence on the part of the drawee, rendering him responsible to the drawer. The Act 19 and 20 Vict. c. 25 enacted that a cheque bearing across its face an addition of the name of any banker or of the words "and Company" should be payable only through some banker. Payment made otherwise than through a banker hitherto indirectly and practically invalid was thus made directly and as a matter of law invalid. In the construction of this statute it was held by the Court of Common Pleas, in the case of *Simmons v. Taylor* (27 *Law Journal*, 45), that the crossing was no part of the cheque and that its fraudulent obliteration was no forgery of the cheque, and that the payment, without negligence, of a cheque with the crossing so obliterated was good as against the drawer. This decision led to the Act 21 and 22 Vict. c. 69, which made the crossing a part of the cheque and its fraudulent obliteration a felony. A holder may cross an uncrossed cheque, or prefix any banker's name to the words "and Co.," but if a particular banker is once named the cheque is henceforth payable through him alone. When a crossing has been obliterated a wrong payment of the cheque is consequence, if without fraud or negligence on the part of the banker, shall not be questioned. In a recent case (*Smith v. Union Bank of London*) the effect of these enactments was explained by the Court of Appeal in a manner which startled the commercial community. It was held that the plaintiff had crossed a cheque received by him from a customer with the name of his own banker. The cheque was stolen, and finally passed for full value to one who paid it into his bankers, and they in turn received payment of it from the defendants. The court held that the negotiability of the cheque was not affected by statute, that it had become the lawful holder, and that the plaintiff had no action against the defendants. The consequence of this decision was the Act 39 and 40 Vict. c. 81, which provided that when a cheque bears across its face an addition of the words "and Company," or any abbreviation thereof, between two parallel transverse lines or of two parallel transverse lines simply, and either with or without the words "not negotiable," that addition shall be deemed a crossing, and the cheque shall be deemed to be crossed generally. When a cheque bears across its face an addition of the name of a banker either with or without the words "not negotiable," that addition shall be deemed a crossing, and the cheque shall be deemed to be crossed specially, and to be crossed through that banker. When a cheque is uncrossed, the lawful holder may cross it generally or specially; when it is crossed generally, he may cross it specially, and when it is crossed specially he may add the words "not negotiable." When a cheque is crossed specially, the banker to whom it is specially crossed may again cross

CHER, a central department of France, embracing the eastern part of the ancient province of Berry and part of Bourbonnais, bounded N. by the department of Loire, W. by Loir-et-Cher and Indre, S. by Allier and Creuse, and E. by Nièvre and Loire. It is situated between $46^{\circ} 18'$ and $47^{\circ} 41'$ N. lat. and between $1^{\circ} 50'$ and $3^{\circ} 6'$ E. long., and has an area of 2780 square miles. The surface of the department in general is extremely level, the only elevated districts being on the northern and north-western frontiers, which are skirted by a range of low hills. The principal rivers, besides the Cher and its tributaries, are the Grande Sauldre and Petite Sauldre on the N., but the Loire and Allier, though not falling within the department, drain the eastern districts, and are available for navigation. The Cher itself becomes navigable when it receives the Arnon and Yèvre, and the communications of the province are greatly facilitated by the Canal du Berry, which traverses it in all its length, the lateral canal of the Loire which stretches from Digoin to Briare, and the canal of the Sauldre. Except in the Sologne, a sandy and sterile tract in the north-west, the soil is generally fertile, but varies considerably in different localities. The most productive region is that on the east, which belongs to the valley of the Loire; the central districts are tolerably fertile but marshy, being often flooded by the Cher; while in the south and south-west there is a considerable extent of dry and fertile land. The department contains a comparatively large extent of pasturage, which has given rise to a considerable trade in horses, cattle, sheep, and wool.

CHERBOURG, a naval station, fortified town, and seaport of France, in the department of La Manche, on the northern shore of the peninsula of Cotentin, at the mouth of the small River Divette, in 49° 38' N. lat., 1° 38' W. long. It stands on a bay formed by Cape Levi on the E. and Cape La Hogue on the W., and is distant 75 miles from the Isle of Wight, 41 miles W. by N. from St Lo, and 212

in the same direction from Paris. The town in itself is small and unimportant. Its houses are built of stone and roofed with slate; but the streets are narrow, and the only public buildings of any interest are the tower (a remnant of the old fortifications), the church of La Trinité, in front of which is the colossal statue of Napoleon I. by Level; the Chapelle de Notre Dame du Vœu, formerly part of the abbey founded by the Empress Maude in the 12th century; the Hôtel de Ville, which contains the Henry Museum and the library; the bathing establishments, opened in 1827; and the theatre. The town is supplied with water.

from a reservoir completed in 1874 at Château d'Eau, about three quarters of a mile distant, and capable of containing upwards of 500,000 gallons. Cherbourg derives its chief importance from its naval and commercial harbours, which are distant from each other about half a mile. The former is cut out of the rock, and is capable of accommodating fifty men-of-war of the largest size. The depth of water at full tide is 50 feet, at low tide 25 feet. Connected with the harbour are the dry docks, the yards where the largest ships in the French navy are constructed, the magazines, the rope walks, and the various workshops requisite for a naval arsenal of the first class. The works are carefully guarded on every side by redoubts and fortifications, and are commanded by batteries on the surrounding hills so completely that the harbour of Cherbourg may be pronounced one of the strongest in the world. The commercial harbour at the mouth of the Divetto communicates with the sea by a canal 650 feet in length and 54 in width. It consists of two parts, an outer harbour 262 yards long by 218 wide, and a basin 446 yards long and 138 wide, in which the depth of water is 19 feet at low tide, and will be increased by the dredging operations commenced in 1874. Outside these harbours is the triangular bay, which forms the roads of Cherbourg. This bay is admirably sheltered by the land on every side but the north. To protect the shipping from the violence of the north winds the great *digue*, or break water, has been constructed. This immense work is $2\frac{1}{2}$ miles in length; its breadth at the base is 262 feet, and at the summit 101 feet. Its foundation was formed by massy wooden frames, which were sunk and filled with stones; and it is now protected from the waves by a parallel line of large blocks weighing each 44 tons. The industrial activity of Cherbourg is considerable, its principal products being cotton yarn, refined sugar, soda, leather, and chemicals. A lace factory gives employment to nearly 400 women. The chief articles of export are farm and dairy produce, more especially potatoes, butter, and pigs; and the imports consist mainly of coal, iron, timber, and cotton. The population in 1846 was 22,460; in 1872 it amounted to 34,785.

Cherbourg is supposed by some investigators to occupy the site of the Roman station of *Coriallum*, but nothing definite is known about its origin. The name was long regarded as a corruption of *Cæsar's Burgus*, or Cæsar's Borough, but there is at least as much probability that it is the same as the English Scarborough. The castle is mentioned in the 11th century, and the town certainly existed in the 10th. William the Conqueror supplied it with a hospital and a church; and Henry II. on several occasions chose it as his residence. In 1295, it was pillaged by an English fleet from Yarmouth; and in the 14th century it frequently suffered during the invasions of Normandy. Captured by the English in 1418 after a four months' siege, it was recovered by Charles VII. of France in 1450. An attempt was made under Louis XIV. to construct a military port; but the fortifications were dismantled in 1689, and further damage was inflicted by the English in 1758. Louis XVI. commenced the construction of the breakwater, and his plans were afterwards carried out and extended by Napoleon I., who is said to have declared that he would renew at Cherbourg the wonders of Egypt, and raise his pyramid in the sea. It was left, however, to Louis Philippe, and particularly to Napoleon III., to complete his designs; and their successful realization was celebrated in 1853, in the presence of the Queen of England, against whose dominions they had at one time been mainly directed. Between 1783 and the close of 1857, 66,862,000 francs had been expended on the works.

CHERIBON, or SHERIBON, a seaport town on the north coast of Java, capital of a residency of the same name, and the seat of a Dutch governor, is situated at the head of a wide bay 125 miles E.S.E. of Batavia, in $6^{\circ} 48' S.$ lat. and $108^{\circ} 38' E.$ long. It was formerly a place of importance, but it has never fully recovered from the effects of a disastrous plague which visited the place at the beginning of this century. The town and harbour are defended by a fort called the Beschermer or Protector which also serves

as a convict prison. A church, founded in 1842, is used in common by Protestants and Roman Catholics; the Mussulman population has its mosque, and the Chinese their *klin-ting* or temple. A school for European children was opened in 1824, and a Government school in 1854. The Chinese district is pretty populous; but no estimate exists of the actual number. At some distance from the town are the graves of the sultans, among whom the most remarkable is Ibnu Mulana, who introduced the Mahometan religion here in 1406. The district is very fertile, and produces the finest coffee raised in the island. Timber, cotton, indigo, sugar, and pepper are exported in large quantities. Total population of district in 1856, 769,331.

CHEROKEES, CHEROKESE, or, in the form employed by themselves, *Tsaraghee*, or *Chelake*, a tribe of North American Indians, now settled in the Indian Territory, where they occupy an area of 5960 square miles in the north-east and a strip along the north of about 8500. Before their removal thither they possessed a large tract of country now distributed among the States of Alabama, Georgia, Mississippi, Tennessee, and the western part of Florida. They were then distinguished into two great divisions, the Ottare or Otari, who dwelt in the mountainous districts, and the Airate or Erati, who inhabited the lower grounds; and they were further divided into seven clans, each of which prohibited intermarriage between its own members. They attached themselves to the English in the disputes and contests which arose between the European colonizers, formally recognized the English king in 1730, and in 1755 ceded a part of their territory and permitted the erection of English forts. Unfortunately this amity was interrupted not long after; but peace was again restored in 1761. The tribe was gradually advancing in civilization when the Revolutionary War broke out, and they sided with the Royalist party. This, of course, led to their subjugation by the new republic, and they were forced to surrender that part of their lands which lay to the south of the Savannah and east of the Chattahoochee. Peace was made in 1781, and in 1785 they recognized the supremacy of the United States, and were established in their possessions. The gradual advance of immigration soon led to disputes with the settlers, and the Cherokees were treated with the most high-handed injustice by the States, and more especially by Georgia. Exodus after exodus took place; a small part of the tribe desired a complete removal to another district; but the main body was neither to be bribed nor frightened from their country. An appeal was made to the United States Government; but it lent a deaf ear to their prayers, and in Congress voted that a treaty concluded with a miserable minority should be regarded as binding on the whole tribe, which about the time numbered 27,000. A force of 2000 men was accordingly sent under General Scott, which compelled them to emigrate to their present position. After the settlement various disagreements between the Eastern and Western Cherokees continued for some time; but in 1839 a union was effected. In the civil war of 1862 they all at first sided with the South; but before long a strong party joined the North, and this led to a disastrous internecine struggle. On the close of the contest they were confirmed in the possession of their territory, but were forced to give a portion of their lands to their emancipated slaves. Since then they have peacefully advanced in prosperity and civilization; and under the influence of the Moravia Baptist, Methodist, and Congregational missions they have been partially Christianized. In 1873 their number amounted to 17,217; their private property was worth \$5,000,000; there were 63 schools attended by 1884 pupils; 89,250 acres were under cultivation, and their stock included 15,000 horses, 103,302 cattle, 3050 sheep, and

68,868 swine. They live in well-built villages, and maintain industrial habits. Their territory is distributed into eight districts; and their chief town is Tablequah, situated in the south-east corner of the country. A newspaper is published in the capital in English and Cherokee, and a literature is being gradually formed. Their language consists of two dialects,—a third, called Gidcowa, having been lost. The syllabic alphabet invented in 1821 by George Guess is the character employed.

CHERRY (*Cerasus*). As a cultivated fruit-tree the cherry is generally supposed to be of Asiatic origin, whence, according to Pliny, it was brought to Italy by Lucullus after his defeat of Mithridates, king of Pontus, 68 B.C. As with most plants which have been long and extensively cultivated, it is a matter of difficulty, if not an impossibility, to identify the parent stock of the numerous cultivated varieties of cherry; but they are generally referred to two species, *Cerasus sylvestris*, the wild or corone cherry or gean-tree (the *mérissier* of the French) and *C. vulgaris*, the common cherry-tree (French *cerisier*). The former species appears to be indigenous on the Mediterranean coasts, and in Central Europe, including the British Islands; and it is probable that it is the latter species or some of its valuable cultivated varieties which was introduced by Lucullus.

The genus *Cerasus* includes trees of moderate size and shrubs, having smooth serrate leaves, white flowers, and a drupaceous fruit. They are natives of the temperate regions of both hemispheres; and the cultivated varieties ripen their fruit in Norway as far as 63° N. The geans are generally distinguished from the common cherry by the greater size of the trees, and the deeper colour and comparative insipidity of the flesh in the ripe fruit, which adheres firmly to the "nut" or kernel; but among the very numerous cultivated varieties specific distinctions shade away so that the fruit cannot be ranged under these two heads. In the *Fruit Catalogue* published by the Horticultural Society in 1842, eighty varieties are enumerated, and to these considerable additions have since been made by cultivation both in Europe and America. The leading varieties are recognized as Bigarreaux, Dukes, Morellos, and Geans. Several varieties are cultivated as ornamental trees and on account of their flowers.

The cherry is a well flavoured sub-acid fruit, and is much esteemed for dessert; but it should be used cautiously, as, especially if not quite ripe, it has a tendency to disorder the bowels. Some of the varieties are particularly selected for pies, tarts, &c., and others for the preparation of preserves, and for making cherry brandy. The fruit is also very extensively employed in the preparation of the liqueurs known as Kirschwasser, ratafia, and maraschino. Kirschwasser is made chiefly on the upper Rhine from the wild black gean, and in the manufacture the entire fruit-flesh and kernels are pulped up and allowed to ferment. By distillation of the fermented pulp the liqueur is obtained in a pure colourless condition. Ratafia is similarly manufactured, also by preference from a gean. Maraschino, a highly valued liqueur, the best of which is produced at Zara in Dalmatia, differs from these in being distilled from a cherry called marasca, the pulp of which is mixed with honey, honey or sugar being added to the distillate for sweetening. It is also said that the flavour is heightened by the use of the leaves of the perfumed cherry, *Cerasus Mahaleb*.

The wood of the cherry tree is valued by cabinetmakers, and that of the gean tree is largely used in the manufacture of tobacco pipes. The American red cherry, *Cerasus serotina*, is much sought after, it being compact, fine-grained, not liable to warp, and susceptible of receiving a brilliant polish. The bark of this species is very highly

esteemed in America as a mild tonic and sedative medicine, and is coming into use for the same purpose in Great Britain. The kernels of the perfumed cherry, *C. Mahaleb*, are used in confectionery, and for scenting toilet soap. A gum exudes from the stem of cherry-trees similar in its properties to gum arabic.

CHERSO, an island of Illyria, included in the government of Trieste, in the Gulf of Quarnero, connected with the island of Osero by a bridge, and separated from the mainland by the channel of Farissina. It is about 35 miles in length, with an area of 105 square miles, and has about 7600 inhabitants. It is traversed by a range of mountains, forming natural terraces on which vines and olive trees flourish. The other parts of the island are covered with bushes of laurel and mastic, but there are scarcely any large trees. There is a scarcity of springs, and the houses are generally furnished with cisterns for rain water. The capital of the same name, on the western side of the island, has a cathedral, several churches and monasteries, and 4673 inhabitants. In the centre of the island, at 40 Paris feet above the level of the sea, is an interesting lake called the Vrana or Crow's Lake, which, according to the hypothesis of Dr Lorenz of Fiunse, is connected with the island of Osero.

CHERSONESE, **CHERSONESUS**, or **CHERRONESTUS** (from *χέρσος*, mainland, and *ἴσος*, island), is a word equivalent to peninsula. In ancient geography, the Chersonesus Thracica, Chersonesus Taurica or Scythica, and Chersonesus Cimbrica correspond respectively to the peninsula of the Dardanelles, the Crimea, and Jutland; and the Golden Chersonese (*ἡ χρυσή χερσόνησος*) is usually identified with the peninsula of Malacca. The Tauric Chersonese was further distinguished as the Great, in contrast to the Heracleotic or Little Chersonese at its south-western corner, where the town of Sebastopol now stands.

CHERTSEY (in Saxon *Ceorles Eyz* or *Ceorl's Island*), a market-town of England, on the south bank of the Thames, in the county of Surrey, about 25 miles W.S.W. from London by railway. It is connected with Middlesex by a bridge of seven arches, built of Purbeck stone in 1785. The parish church, rebuilt in 1808 at a cost of £12,000, contains a tablet to Charles James Fox, who resided at St Anne's Hill in the vicinity, and another to Lawrence Tomson, a translator of the New Testament in the 17th century. The principal educational establishments are supported by a foundation bequeathed in 1725 by the liberality of Sir William Perkins; and they afford a free education to upwards of 200 children. Hardly any remains are left of the great Benedictine abbey, which was rebuilt by Edgar in 963 on the site of an earlier monastery established by Earconwald, bishop of London, in the 7th century. Its buildings at one time included an area of $\frac{1}{2}$ acres; but they fell into almost complete decay in the 17th century, and a "fair house" was erected out of the ruins by Sir Nicholas Carew of Beddington. The ground-plan can yet be traced: the fish ponds are still complete; and carved stone coffins, and encaustic tiles of a peculiar manufacture are frequently exhumed. Among the abbots the most famous was John de Rutherwyke, who was appointed in 1307 and continued, till his death in 1346, to carry on a great system of alteration and extension, which almost made the abbey a new building. The house in which the poet Cowley spent the last years of his life is still extant, as the chamber in which he died is preserved unaltered. The town is the seat of a county court, and possesses a literary institute and an agricultural society. Its principal trade is in produce for the London markets. During the 7th century Chertsey was the residence of the South Saxon king. Population of the parish in 1872, 7763; of the town about 3000.

CHERUBIM (plural of cherub) were "celestial genii," and, in M. de Sauley's opinion, little else can be positively affirmed (*Histoire de l'art juif*, p. 24). Fresh light has, however, recently been thrown upon them from the cuneiform inscriptions, and we are no longer reduced to admit that "le vaste champ des hypothèses restera toujours ouvert." According to the Old Testament, the cherub united the functions of bearer and guardian of deity; or rather, perhaps, there was a divergence in the popular beliefs on this subject. In Ps. xviii. 10, 2 Sam. xxii. 11 Yahweh (the so called Jehovah) is described as "riding upon a cherub," and in the parallel line as "swooping," the word applied in Deut. xxviii. 49 and elsewhere to the flight of the eagle. Putting the two phrases together, we may conclude that, according to one version of the myth—whether fully believed in or not by the Psalmist need not here be discussed—the cherub was either an eagle or a quadruped with eagle's wings. This result would seem to justify connecting the word with the Assyrian *kurubu*, a synonym of *kurukku* or *karakku*, the "circling" bird, i.e., according to Friedrich Delitzsch, the vulture. On the other hand, the prophet Ezekiel (xxviii. 13–16), though agreeing with the Psalmist in mentioning but one cherub, describes him as "walking in the midst of stones of fire" (i.e., thunderbolts), and as extending his wings over "the holy mountain of Elohim," in other words, as the attendant and guard rather than as the bearer of deity. And in the fuller account of Paradise in Genesis "the cherubim" (i.e., the entire band of cherubs) are stationed "with (or near) the blade of the turning sword" (this, like the "tree of life," has a Babylonian analogue, and is a mythic phrase meaning the lightning,—see references below) "to guard the way to the tree of life" (Gen. iii. 24). Now, according to a talismanic inscription copied by Lenormant, *kirubu* is a synonym for the steer-god, whose winged image filled the place of guardian at the entrance of the Assyrian palaces. And in the fantastic description of Ezekiel penned by the River Chebar, one of the four faces of a cherub was that of an ox (Ezek. i. 10, after which the corrupt passage in x. 14, must, in spite of Lenormant, be corrected). We should, therefore, connect the word cherub primarily with the Assyrian *kirubu*, but also, as proposed above, with *kurubu*. The two forms seem to be co-ordinate and expressive of some quality common to the king of birds and the colossal steer. Their etymology is altogether uncertain, and possibly to be sought for (as Mr Sayce has suggested) outside the sphere of Semitism. Partial parallels to the cherubim in non-Semitic mythologies are not uncommon, but are mostly deceptive. The most complete one is that of the winged γρυπές (a secondary form of kerubim), who not only watched over the treasures of the gods (cf. Herod. iv. 13, 116), but were also the bearers of deity, if at least Plutarch and Eustathius may be followed in identifying the τετρασκελὴς οἰωνός of Æsch. *Prom.* 395 with the griffin (see Hermann, *ad loc.*) Probably the griffin was imagined under more than one form. This was certainly the case with the Hebrew cherub, as appears not only from the passages referred to above, but from the inconsistencies of the single prophet Ezekiel (cf. i. 6, xli. 18). The significance of the mythical cherubim has been well pointed out by C. P. Tiele. They are probably the masses of clouds, which seem to guard the portals of the sky, and on which the sun-god appears to issue forth at break of day. This will account for the expressions used of the cherubim both of the heavenly and of the earthly "habitation" of Yahweh, expressions taken up by the Biblical writers from the folklore of their times.

For the Assyrian authorities, see Schrader, *Jenaische Literaturzeitung*, 1874, p. 218; Delitzsch (the younger), *Assyrische Studien*, pp. 107, 108; and for the Babylonian lightning-myth, Lenormant,

Bérose, p. 138; *Records of the Past*, vol. iii. pp. 127–129. Compare also Herder, *Werke*, vol. xxxiii. (*Geist der Hebräischen Poesie*), pp. 168–180; Ewald, *Antiquities of Israel*, Eng. transl., p. 123; Riehm, in *Theologische Studien und Kritiken*, 1871; Tiele, *Vergelijkende geschiedenis der oude godsdiensten*, vol. i. p. 366; and F. W. Farrar in Kitto's *Cyclopædia of Biblical Literature*, art. "Cherubim." (T. K. C.)

CHERUBINI, MARIA LUIGI ZENOBIO CARLO SALVATORE (1760–1842), one of the greatest musical composers of modern times, was born at Florence, 14th September 1760. His father was accompanist (*maestro al cembalo*) at the Pergola theatre, and himself guided the first musical education of his son, whose talent began to evince itself at a very early period. "I commenced learning music," Cherubini says of himself, "at six years, composition at nine; the former I was taught by my father, the latter by Bartholomew Felici and his son Alexander." Italian music at that time was at a low ebb. The popular composers of *opera seria* chiefly aimed at inventing pleasing tunes and *fioriture* for the vocal display of the singers; the dignity and grandeur of the old Italian school were all but lost. To imbue himself with these great traditions of the past was the chief aim of young Cherubini's ambition, and for that purpose he went in 1777 to Bologna, where for four years he studied under Joseph Sarti, a well-known composer and theorist of the time, and himself the pupil of the celebrated Padre Martini, one of the greatest contrapuntists Italy has produced. It was in this school that Cherubini laid the foundation of that deep knowledge of his art which gives to all his works the impress of perfect mastership. It was also under Sarti's guidance that he made his first attempts at dramatic composition. They were preceded, however, by a mass written at the age of thirteen, and various other sacred compositions. Sarti was the composer of numerous operas, amongst which *Le Nozze di Donina* may be mentioned as the most successful one. It now became Cherubini's task to supply the music for the minor characters in his master's dramatic works, an excellent way of gaining versatility of style and resource, turned to full account by the young composer. His first independent work was called *Quinto Fabio*, an *opera seria*, in three acts, first performed in 1780, and soon followed by *Armida* (1782), *Adriano in Siria* (same year), and several other works of a similar kind. At this time of his life his artistic individuality was forming gradually; but as yet he had not emerged from the purely imitative stage of production. Absolute artistic value these juvenile works do not possess, but they tended to prepare Cherubini for greater things, and in the meantime secured him a dignified position amongst contemporary composers. In 1784 he was asked to write two works for the Italian opera in London, one of which, *Lafinta principessa*, was favourably received, while the other, *Giulio Sabino* was "murdered" by the critics, to use the emphatic expression of a contemporary witness. In 1786 he left London, whither he had gone to be present at the production of his operas, and went to Paris. After a short stay in Italy he took up his permanent residence in the latter city.

Cherubini may be cited as a striking instance of the amalgamating power inherent in the French type of national culture; Spontini, Meyerbeer, and to some extent Gluck, submitted to the same spell. With the last-mentioned master Cherubini shares the grand declamatory pathos, the classic dignity which characterizes the Augustan age of French tragedy. A work like Cherubini's *Médée* is imbued with the same elevation of pathos which in Corneille's greatest tragedies makes us forget the stilted affectations of his heroes and heroines. The first opera composed by Cherubini in France is called *Démophon*, words by Marmontel. Its merits were appreciated by connoisseurs, but it

68,868 swine. They live in well-built villages, and maintain industrial habits. Their territory is distributed into eight districts; and their chief town is Tahlequah, situated in the south-east corner of the country. A newspaper is published in the capital in English and Cherokee, and a literature is being gradually formed. Their language consists of two dialects,—a third, called Gidoowa, having been lost. The syllabic alphabet invented in 1821 by George Guess is the character employed.

CHERRY (*Cerasus*). As a cultivated fruit-tree the cherry is generally supposed to be of Asiatic origin, whence, according to Pliny, it was brought to Italy by Lucullus after his defeat of Mithridates, king of Pontus, 68 B.C. As with most plants which have been long and extensively cultivated, it is a matter of difficulty, if not an impossibility, to identify the parent stock of the numerous cultivated varieties of cherry; but they are generally referred to two species, *Cerasus sylvestris*, the wild or corone cherry or gean-tree (the *mêrisier* of the French) and *C. vulgaris*, the common cherry-tree (French *cerisier*). The former species appears to be indigenous on the Mediterranean coasts, and in Central Europe, including the British Islands; and it is probable that it is the latter species or some of its valuable cultivated varieties which was introduced by Lucullus.

The genus *Cerasus* includes trees of moderate size and shrubs, having smooth serrate leaves, white flowers, and a drupaceous fruit. They are natives of the temperate regions of both hemispheres; and the cultivated varieties ripen their fruit in Norway as far as 63° N. The geans are generally distinguished from the common cherry by the greater size of the trees, and the deeper colour and comparative insipidity of the flesh in the ripe fruit, which adheres firmly to the "nut" or kernel; but among the very numerous cultivated varieties specific distinctions shade away so that the fruit cannot be ranged under these two heads. In the *Fruit Catalogue* published by the Horticultural Society in 1842, eighty varieties are enumerated, and to these considerable additions have since been made by cultivation both in Europe and America. The leading varieties are recognized as Bigarreux, Dukes, Morellos, and Geans. Several varieties are cultivated as ornamental trees and on account of their flowers.

The cherry is a well flavoured sub-acid fruit, and is much esteemed for dessert; but it should be used cautiously, as, especially if not quite ripe, it has a tendency to disorder the bowels. Some of the varieties are particularly selected for pies, tarts, &c., and others for the preparation of preserves, and for making cherry brandy. The fruit is also very extensively employed in the preparation of the liqueurs known as kirschwasser, ratafia, and maraschino. Kirschwasser is made chiefly on the upper Rhine from the wild black gean, and in the manufacture the entire fruit-flesh and kernels are pulped up and allowed to ferment. By distillation of the fermented pulp the liqueur is obtained in a pure colourless condition. Ratafia is similarly manufactured, also by preference from a gean. Maraschino, a highly valued liqueur, the best of which is produced at Zara in Dalmatia, differs from these in being distilled from a cherry called marasca, the pulp of which is mixed with honey, honey or sugar being added to the distillate for sweetening. It is also said that the flavour is heightened by the use of the leaves of the perfumed cherry, *Cerasus Mahaleb*.

The wood of the cherry tree is valued by cabinetmakers, and that of the gean tree is largely used in the manufacture of tobacco pipes. The American red cherry, *Cerasus serotina*, is much sought after, it being compact, fine-grained, not liable to warp, and susceptible of receiving a brilliant polish. The bark of this species is very highly

esteemed in America as a mild tonic and sedative medicine, and is coming into use for the same purpose in Great Britain. The kernels of the perfumed cherry, *C. Mahaleb*, are used in confectionery, and for scenting toilet soap. A gum exudes from the stem of cherry-trees similar in its properties to gum arabic.

CHERSO, an island of Illyria, included in the government of Trieste, in the Gulf of Quarnero, connected with the island of Osero by a bridge, and separated from the mainland by the channel of Farissina. It is about 35 miles in length, with an area of 105 square miles, and has about 7600 inhabitants. It is traversed by a range of mountains, forming natural terraces on which vines and olive trees flourish. The other parts of the island are covered with bushes of laurel and mastic, but there are scarcely any large trees. There is a scarcity of springs, and the houses are generally furnished with cisterns for rain water. The capital of the same name, on the western side of the island, has a cathedral, several churches and monasteries, and 4673 inhabitants. In the centre of the island, at 40 Paris feet above the level of the sea, is an interesting lake called the Vrana or Crow's Lake, which, according to the hypothesis of Dr Lorenz of Fiume, is connected with the island of Osero.

CHERSONESE, **CHERSONESUS**, or **CHERRONESUS** (from *χέρσος*, mainland, and *ἴσος*, island), is a word equivalent to peninsula. In ancient geography, the Chersonesus Thracica, Chersonesus Taurica or Scythica, and Chersonesus Cimbrica correspond respectively to the peninsula of the Dardanelles, the Crimea, and Jutland; and the Golden Chersonese (*ἡ χρυσή χερσόνησος*) is usually identified with the peninsula of Malacca. The Tauric Chersonese was further distinguished as the Great, in contrast to the Heracleotic or Little Chersonese at its south-western corner, where the town of Sebastopol now stands.

CHERTSEY (in Saxon *Ceortes Eye* or *Ceortu's Island*), a market-town of England, on the south bank of the Thames, in the county of Surrey, about 25 miles W.S.W. from London by railway. It is connected with Middlesex by a bridge of seven arches, built of Purbeck stone in 1785. The parish church, rebuilt in 1808 at a cost of £12,000, contains a tablet to Charles James Fox, who resided at St Anne's Hill in the vicinity, and another to Lawrence Tomson, a translator of the New Testament in the 17th century. The principal educational establishments are supported by a foundation bequeathed in 1725 by the liberality of Sir William Perkins; and they afford a free education to upwards of 200 children. Hardly any remains are left of the great Benedictine abbey, which was rebuilt by Edgar in 963 on the site of an earlier monastery established by Earconwald, bishop of London, in the 7th century. Its buildings at one time included an area of 4 acres; but they fell into almost complete decay in the 17th century, and a "fair house" was erected out of the ruins by Sir Nicholas Carew of Beddington. The ground-plan can yet be traced; the fish ponds are still complete; and carved stones, coffins, and encaustic tiles of a peculiar manufacture are frequently exhumed. Among the abbots the most famous was John de Rutherwyke, who was appointed in 1307, and continued, till his death in 1346, to carry on a great system of alteration and extension, which almost made the abbey a new building. The house in which the poet Cowley spent the last years of his life is still extant, and the chamber in which he died is preserved unaltered. The town is the seat of a county court, and possesses a literary institute and an agricultural society. Its principal trade is in produce for the London markets. During the 7th century Chertsey was the residence of the South Saxon kings. Population of the parish in 1872, 7763; of the town, about 3000.

CHERUBIM (plural of cherub) were "celestial genii," and, in M. de Sauley's opinion, little else can be positively affirmed (*Histoire de l'art juif*, p. 24). Fresh light has, however, recently been thrown upon them from the cuneiform inscriptions, and we are no longer reduced to admit that "le vaste champ des hypothèses restera toujours ouvert." According to the Old Testament, the cherub united the functions of bearer and guardian of deity; or rather, perhaps, there was a divergence in the popular beliefs on this subject. In Ps. xviii. 10, 2 Sam. xxii. 11 Yahweh (the so called Jehovah) is described as "riding upon a cherub," and in the parallel line as "swooping," the word applied in Deut. xxviii. 49 and elsewhere to the flight of the eagle. Putting the two phrases together, we may conclude that, according to one version of the myth—whether fully believed in or not by the Psalmist need not here be discussed—the cherub was either an eagle or a quadruped with eagle's wings. This result would seem to justify connecting the word with the Assyrian *kurabu*, a synonym of *kurukku* or *karukku*, the "circling" bird, i.e., according to Friedrich Delitzsch, the vulture. On the other hand, the prophet Ezekiel (xxviii. 13-16), though agreeing with the Psalmist in mentioning but one cherub, describes him as "walking in the midst of stones of fire" (i.e., thunderbolts), and as extending his wings over "the holy mountain of Elohim," in other words, as the attendant and guard rather than as the bearer of deity. And in the fuller account of Paradise in Genesis "the cherubim" (i.e., the entire band of cherubs) are stationed "with (or near) the blade of the turning sword" (this, like the "tree of life," has a Babylonian analogue, and is a mythic phrase meaning the lightning,—see references below) "to guard the way to the tree of life" (Gen. iii. 24). Now, according to a talismanic inscription copied by Lenormant, *kirubu* is a synonym for the steer-god, whose winged image filled the place of guardian at the entrance of the Assyrian palaces. And in the fantastic description of Ezekiel penued by the River Chebar, one of the four faces of a cherub was that of an ox (Ezek. i. 10, after which the corrupt passage in x. 14, must, in spite of Lenormant, be corrected). We should, therefore, connect the word cherub primarily with the Assyrian *kirubu*, but also, as proposed above, with *kurubu*. The two forms seem to be co-ordinate and expressive of some quality common to the king of birds and the colossal steer. Their etymology is altogether uncertain, and possibly to be sought for (as Mr Sayce has suggested) outside the sphere of Semitism. Partial parallels to the cherubim in non-Semitic mythologies are not uncommon, but are mostly deceptive. The most complete one is that of the winged γρυπες (a secondary form of kerubim), who not only watched over the treasures of the gods (cf. Herod. iv. 13, 116), but were also the bearers of deity, if at least Plutarch and Eustathius may be followed in identifying the τετρασκελὴς οὐκνός of Aesch. *Prom.* 395 with the griffin (see Hermann, *ad loc.*) Probably the griffin was imagined under more than one form. This was certainly the case with the Hebrew cherub, as appears not only from the passages referred to above, but from the inconsistencies of the single prophet Ezekiel (cf. i. 6, xli. 18). The significance of the mythical cherubim has been well pointed out by C. P. Tiele. They are probably the masses of clouds, which seem to guard the portals of the sky, and on which the sun-god appears to issue forth at break of day. This will account for the expressions used of the cherubim both of the heavenly and of the earthly "habitation" of Yahweh, expressions taken up by the Biblical writers from the folklore of their times.

For the Assyrian authorities, see Schrader, *Jenauer Literaturzeitung*, 1874, p. 218; Delitzsch (the younger), *Assyrische Studien*, pp. 107, 108; and for the Babylonian lightning-myth, Lenormant,

W. Farrar in Kitto's *Cyclopædia of Biblical Literature*, art. "Cherubim." (T. K. C.)

CHERUBINI, MARIA LUIGI ZENOBIO CARLO SALVATORE (1760-1842), one of the greatest musical composers of modern times, was born at Florence, 14th September 1760. His father was accompanist (*maestro al cembalo*) at the Pergola theatre, and himself guided the first musical education of his son, whose talent began to evince itself at a very early period. "I commenced learning music," Cherubini says of himself, "at six years, composition at nine; the former I was taught by my father, the latter by Bartholomew Felici and his son Alexander." Italian music at that time was at a low ebb. The popular composers of *opera seria* chiefly aimed at inventing pleasing tunes and *fioriture* for the vocal display of the singers; the dignity and grandeur of the old Italian school were all but lost. To imbue himself with these great traditions of the past was the chief aim of young Cherubini's ambition, and for that purpose he went in 1777 to Bologna, where for four years he studied under Joseph Sarti, a well-known composer and theorist of the time, and himself the pupil of the celebrated Padre Martini, one of the greatest contrapuntists Italy has produced. It was in this school that Cherubini laid the foundation of that deep knowledge of his art which gives to all his works the impress of perfect mastership. It was also under Sarti's guidance that he made his first attempts at dramatic composition. They were preceded, however, by a mass written at the age of thirteen, and various other sacred compositions. Sarti was the composer of numerous operas, amongst which *Le Nozze di Donina* may be mentioned as the most successful one. It now became Cherubini's task to supply the music for the minor characters in his master's dramatic works, an excellent way of gaining versatility of style and resource, turned to full account by the young composer. His first independent work was called *Quinto Fabio*, an *opera seria*, in three acts, first performed in 1780, and soon followed by *Armida* (1782), *Adriano in Siria* (same year), and several other works of a similar kind. At this time of his life his artistic individuality was forming gradually; but as yet he had not emerged from the purely imitative stage of production. Absolute artistic value these juvenile works do not possess, but they tended to prepare Cherubini for greater things, and in the meantime secured him a dignified position amongst contemporary composers. In 1784 he was asked to write two works for the Italian opera in London, one of which, *Lafinta principessa*, was favourably received, while the other, *Giulio Sabino*, was "murdered" by the critics, to use the emphatic expression of a contemporary witness. In 1786 he left London, whither he had gone to be present at the production of his operas, and went to Paris. After a short stay in Italy he took up his permanent residence in the latter city.

Cherubini may be cited as a striking instance of the amalgamating power inherent in the French type of national culture; Spontini, Meyerbeer, and to some extent Gluck, submitted to the same spell. With the last-mentioned master Cherubini shares the grand declamatory pathos, the classic dignity which characterizes the Augustan age of French tragedy. A work like Cherubini's *Médée* is imbued with the same elevation of pathos which in Corneille's greatest tragedies makes us forget the stilted affectations of his heroes and heroines. The first opera composed by Cherubini in France is called *Démophon*, words by Marmontel. Its merits were appreciated by connoisseurs, but it

was not a popular success. This, however, was achieved in the most brilliant manner by Cherubini's next opera, *Lodoiska* (1791), which opens the series of great dramatic works belonging to the composer's second period. The representative production of this period is *Médée*, already alluded to. The main characteristics of the composer's style have also been briefly touched upon. From a mere musical point of view a bold though always strictly logical sequence of harmonies, a rich vein of melodious developments, and great brilliancy and originality of instrumental effects ought to be added.

By the production of *Médée* (1797) the composer's reputation was firmly established. All Paris was in rapturous admiration of his genius, with one exception—Napoleon Bonaparte. The young victorious general aspired to musical amateurship, and loved to speak authoritatively on that as on most other subjects. But it was not in Cherubini's character to bow to any man, however great, in matters artistic. Cherubini's repeated remonstrances against Napoleon's exaggerated enthusiasm for Pacsiello, Zingarelli, and other ephemeral composers culminated in the blunt repartee,—“Citoyen-général, I perceive that you love only that music which does not prevent you from thinking of your politics.” The emperor remembered the affront offered to the citizen-general, and the appointment of Imperial chapelmaster was given to Lesneux, in spite of the Italian composer's superior merits. But Cherubini does not seem to have suffered much under this disappointment. Two works replete with serene joy owe their origin to the period alluded to—*Anacreon* (1803) and *Les deux Journées* (1804). The last-mentioned work is Cherubini's masterpiece of comic opera. In it we admire the grace and true gaieté de cœur, which have made the comic opera of France deservedly famous amongst civilized nations. The libretto of *Les deux Journées*, although clever and piquant, does not offer many opportunities for musical expansion, the action, as is usual in French comic opera, being to a great extent carried on in spoken dialogue. But Cherubini has succeeded in delineating with a few graphic touches the import of his characters and situations. A peasant choros in the third act, a Savoyard's song, and the couplets of Micheli the jovial water-carrier, are insurpassable specimens of their genre, equal in melodious beauty and grace to anything that French composers have produced in these forms of art. Cherubini, indeed, ranks with the greatest masters of the French school,—with Grétry, Dalayrac, Auber, and Boieldieu, all of whom he infinitely surpasses as far as musical workmanship is concerned.

In 1805 Cherubini went to Vienna, in compliance with an invitation to compose an opera for the imperial theatre of that city. Here his chances of success were once more thwarted by his great antagonist Napoleon, who entered Vienna at the head of the victorious French army, and for a time interrupted all artistic enterprise. The personal meeting of emperor and composer was again of anything but a friendly kind. Soon after the performance of his new work *Faniska* (1806) at Vienna, Cherubini returned to Paris, and for a long time kept an unbroken silence. His chief occupation was his lessons at the Conservatoire, besides which he filled up great part of the day by cutting the hearts and diamonds of ordinary playing cards into all kinds of fantastic figures and landscapes. The results of his extraordinary ingenuity, carefully framed, covered the walls of his study. An accidental circumstance at last roused him from this morbid indolence. He was staying at a country seat of the Prince de Chimay, where a new church was to be inaugurated. Timidly was an appeal made to him for a religious composition to be performed on the occasion, and in compliance with this request he wrote in a few weeks his great Mass in F. Thus at a time of

life when most artists rest on their laurels he entered a new field of creative labour—that of sacred music. Of the works of Cherubini's third and perhaps his greatest period only the most important can be mentioned here. They are the Missa Solemnis in D, the coronation mass written for the consecration of Charles X., and the two requiems in C and D, the latter for male voices. Besides these he wrote numerous smaller compositions for the service of the Chapel Royal, most of which are still unpublished. The most striking feature of Cherubini's sacred compositions is their solemn grandeur of conception, combined with an unequalled mastership of artistic treatment.

The Restoration of the Bourbons drew Cherubini from his long seclusion. The royal family were eager to show their favour to the opponent of Napoleon Bonaparte. Cherubini was created composer and conductor to the Chapel Royal, and in 1821 obtained the permanent directorship of the Conservatoire. His days were prolonged beyond the ordinary ago of men, and after having witnessed and partly celebrated numberless revolutions in his adopted country, the more than septuagenarian retained sufficient vigour of mind to write one of his most charming operas when Louis Philippe was king in France. It is called *Ali Baba*, and was first performed in 1833. To the list of his dramatic compositions ought also to be added another important opera, *Les Abencerrages*, written in 1813, but treated with undeserved neglect by the public. He also wrote several pieces of chamber music, amongst which six quartets for strings, and one quintet and six sonatas for the pianoforte may be mentioned. A great number of his compositions, moreover, remained in manuscript at his death, March 15, 1842. Cherubini's external bearing was frequently harsh and arrogant; his prejudice against Beethoven, both personally and artistically, is a deplorable instance of his one-sidedness. But his more intimate friends found him kind and faithful. His love of order was carried to excess. All his music was carefully labelled and distributed in pigeon-holes, and even his pocket-handkerchiefs were numbered for consecutive use. To this extreme carefulness we owe a complete catalogue of his own compositions from 1773–1841, edited by M. Böttée de Toulhonn, under the title of *Notice des Manuscrits autographes de la musique composée par M. L. Z. C. S. Cherubini*. We also possess by him a valuable *Cours de contrepoint et de fugue*, the letterpress of which is written by his pupil the well-known composer Halévy. An English biography—*Cherubini, Memorials illustrative of his Life* (Lond. 1874)—has been written by Mr E. Bellasis. An interesting article containing personal reminiscences of Cherubini by the German composer Ferdinand Hiller appeared in *Macmillan's Magazine* in 1875. (F. H.)

CHERUSCI, a tribe of ancient Germany, whose country was bounded on the E. by the Elbe and on the W. by the Weser. In the time of Augustus the cruelty of Varus, who commanded the Roman army on their frontier, drove them into war, and they annihilated the legions sent against them. In the 4th century they had become members of the Frankish confederation.

CHESHIRE, a maritime county in the north-west of England, is bounded on the N. by the Mersey, which separates it from Lancashire, on the N.E. by Yorkshire, on the E. by Derbyshire and Staffordshire, on the S. by Shropshire and Denbighshire, on the W. by Flintshire, and on the N.W. by the Irish Sea. Its greatest length from east to west is about 48 miles, and its greatest breadth from south to north about 33 miles. It possesses an area of 705,493 statute acres, or 1102 square miles; and its population in 1871 was 561,201 persons (males, 271,033; females, 290,168). Since the first census in 1801, the population has increased by 368,396 persons, or 191 per cent; and

For
see
Shr
shire

since 1851 the increase has amounted to 105,476 persons, or 23 per cent. in twenty years.

The formation of the county is generally flat, with some hills on the east on the Derbyshire and Yorkshire boundary, which extend also to the Staffordshire side. There are also lower hills near Chester and Flintshire, and at Alderley Edge and Beeston insulated hills standing up out of the prevailing level. The principal geological formation is the New Red Sandstone, which occupies nearly the whole of the central and western part of the county. A small patch of lias occurs in the south. The Coal Measures extend along the eastern side on the borders of Staffordshire and Derbyshire, and also are worked on the banks of the Dee below Chester. The principal mineral produce is salt, which is found as rock-salt in mines at Northwich, and is manufactured there and at Winsford, Middlewich, Sandbach, and Lawton, from the brine-springs overlying the rock-salt. Lead and copper are also found, though not in great quantities. Copper was worked at Alderley Edge at an early period, but the works were discontinued until lately, when they have been recommenced.

The flora of the central plain of Cheshire, which represents its most characteristic vegetation, is intermediate between that of the northern and southern counties of Britain. The botany of the high-lands east of Macclesfield is nearly Ericetum in its nature, akin to that of the West Riding of Yorkshire, whilst in the west the botany of Wirral shows more variety than that of the Midland region, and is more southern in its character. The curious system of marl-pits, and the frequent inland meres, each of which has a vegetation of its own, render Mid Cheshire pre-eminent among English counties for the development of such species as *Carex* and *Potamogeton*. Two rare species may be cited to prove the strong admixture of northern elements in the flora, viz., *Arundo stricta* at Oakmere and *Saxifraga Hirculus*, now unfortunately extinct, at Knutsford. As compared with one near or south of London, a Cheshire arable field shows a lamentable paucity of species. A botanist would only in a day's walk mark 150 species of flowering plants, as against 300 species marked in the same time in Kent or Sussex.

The principal rivers in Cheshire are the Dee, which, rising in the Welsh mountains, forms the boundary between the county and Denbighshire and Flintshire, and ultimately, having formed a wide navigable estuary below Chester, falls into the Irish Sea; the Mersey, which rises in the Yorkshire hills, forms the county boundary along the whole of its northern side, and having given the opportunity for the formation of the ports of Liverpool, Birkenhead, and Runcorn, also fall into the Irish Sea; and the Weaver, which, rising in the south-west of the county, traverses it in a north-westerly course, and being joined by the Dane at Northwich, empties itself into the Mersey at Weston Point. By means of a series of locks, the Weaver has been made navigable for vessels of 200 tons as far as Winsford, and thus furnishes a means of transportation for the salt produced in the locality. The profits of the navigation, which was originally undertaken by a few Cheshire squires, belong to the county, and are paid over annually to the relief of the county rates. At present, in consequence of a large outlay in further deepening and improving the navigation, all payments to the county treasury are suspended, but on an average of late years from £16,000 to £20,000 has been paid over.

Distributed over the surface of the county are small lakes or meres, and it seems to have been a point of honour for the old houses of the gentry to have been built on their banks. Combermere, Tatton, Rostherne, Tabley, Doddington, Marbury, and Mere, with a host of smaller waters, are dotted over the county; whilst nearly in every field

are old marl-pits, whence in former days the sole supply of manure for the permanent pastures was obtained.

The climate is temperate and damp; the soil is varied and irregular, but a large proportion of it is a thin-skinned clay. In only one spot of the county is the soil said to be fertile enough to feed a bullock to the acre. The agriculture of the county, which some twenty-five years ago was backward and discreditable, has marvellously improved in the last quarter of the century. The land, which was wet and full of rushes, has been drained; its fertility has been increased by the periodical application of bone-dust; the old crooked fences have been removed or straightened; and the farm-houses and buildings, which were insufficient for the decent accommodation of man and beast, have been replaced on many estates by modern structures well adapted for their purposes. Dairy-farming is the description of agriculture still principally pursued, and in March 1875 there were, according to the Board of Trade returns, 96,170 cows in the county, whose milk if all converted into cheese would have yielded a produce of about 16,000 tons of cheese. But though the tendency to make cheese in some parts of the county still prevails, the influence of the larger population gathered together round the purely agricultural part of the county has greatly diminished the production of the staple article, whilst the competition of American cheese has made the manufacture of all but the best qualities unprofitable. Liverpool, Manchester, Stockport, Macclesfield, the cotton districts in the north-east of the county, and the Staffordshire Potteries on the south-west, all demand a supply of milk, meat, and garden produce, and the facilities of transit afforded by the railways have in many cases already changed, and gradually in many more will change, the character of Cheshire agriculture. Although in some cases the Cheshire tenant-farmer is little more than a labourer owning cows, working as hard as his own labourers, and with as little or less education, yet there are now a large number of farms as well and skilfully cultivated and producing as large produce to the acre (thanks to the facilities of obtaining manure from the larger towns) as any in the United Kingdom.

During the years 1865 and 1866 a mighty calamity swept over this county. The cattle plague, which had in 1745 destroyed 30,000 head of cattle, appeared in the second week of October 1865 on the southern border of the county. Spreading itself there, and breaking out almost simultaneously on the north-west, west, and east, it had by the 21st February 1866 destroyed 36,823 head of stock. On that day an Act of Parliament was passed to authorize slaughter and to give compensation, and in consequence 35,675 cattle were killed. A loan was granted from the Treasury, on the security of the county rate, of £270,000 to pay the compensation for losses after the 22d February, which entails an annual charge on the county rates of £14,583, 14s. 10d. until the year 1896. Although by this terrible loss many individuals were ruined, and for the time great distress was caused, yet on the whole the agriculture of the district was benefited. Landlords discovered that stringent clauses in their leases might safely be modified; tenant-farmers became convinced that cheesemaking was not the whole duty of the agriculturist, and the possibility and even the necessity of new ways of farming, and of the introduction of sheep or feeding-stock, became apparent.

From the agricultural returns for 1875 (which, however, are not complete) it appears that the average acreage devoted in Cheshire to corn crops is exceptionally low, being 16·2, while the average of all England is 31·2. The following table shows the distribution of the acreage in the county, and the numbers of live stock in the years 1872 and 1875:—

	Oats.	Wheat.	Barley, Beans &c.	Potatoes.	Turnips and Mangolds.	Yetches, Carrots, &c.	Grass under rotation
1872..	46,446	34,195	10,072	20,921	10,001	2,501	64,769
1875...44,908	30,745	9,325	18,770	11,054	1,862		57,400
	Horses.	Cattle.	Sheep.	Pigs.			
1872.....	18,818	155,654	108,377	67,379			
1875.....	20,499	162,466	111,330	61,209			

In the latter year there were 84,981 acres under corn crops, and 31,686 under green crops, both showing a decrease as compared with 1872.

The county is intersected by railways in every direction. At Crewe the London and North-Western Railway divides into three sections, and takes its passengers or goods to Manchester, Liverpool, Chester, and the North. From Stockport and Manchester the Cheshire lines run into the centre of the county and across Delamere Forest to Chester; and there are lines from Chester to Birkenhead, to Manchester, to Shrewsbury, and into the different parts of North and South Wales.

The canals, too, still convey goods from Runcorn and Ellesmere-port to the Staffordshire potteries, and afford means of communication between Manchester, Liverpool, and the interior of the county.

The principal towns are Chester, Birkenhead, Macclesfield, Stockport, Northwich, Crewe, and Congleton. At Stockport the manufacture of hats and cotton is carried on, and Macclesfield and Congleton are the seats of the silk manufacture. At Crewe are situated the great workshops of the London and North Western Railway, and round the station, where in 1841 there was a wooden box, to take the tickets and one solitary farmhouse, there is now crowded a population of nearly 30,000 inhabitants. The trade of Northwich and Winsford is the manufacture of salt, by the evaporation of the water from the brine. During the year 1875 it is calculated that 1,500,000 tons of salt were produced, of which 1,000,000 were for export, 350,000 for chemical works, 100,000 for agricultural purposes, and 50,000 for domestic use. In that year there were in Cheshire 1261 salt-pans, employing over 3000 men. About 150 men are engaged in rock-salt mining, and the carriage of salt on the Mersey and Weaver employs at least 1000 men and 500 boys. Steamers are now largely employed in the inland navigation, between thirty and forty being engaged in the carrying trade.

Besides being in part a manufacturing and in part a purely agricultural county, Cheshire, more perhaps than any place except the districts round the metropolis, is the home of business men. The manufacturers of Manchester, the merchants of Liverpool, the gentlemen employed in the pottery trade, all have their villas here. At Alderley and Bowdon near Manchester, in the Wirrall hundred on the banks of the Mersey, at Alsager on the Staffordshire border, are to be found congeries of the dwellings of rich men, which vie in their appointments and surroundings with the houses of the great landowners of the county. Perhaps no stronger proof can be given of this fact than that, in the return lately furnished to the House of Commons of a summary of the returns of owners of land, the number of properties between 1 acre and 10 is reported to be 3166 out of a total number of 23,720, add the average rental per acre is £24, 13s. These proportions are in the whole return for England and Wales exceeded only in the ex-metropolitan parts of Surrey and Middlesex, and in the mining and manufacturing counties of Lancashire and Glamorganshire.

Cheshire is emphatically a county full of large estates. In the return just quoted may be found the fact that the rental of estates between 5000 and 10,000 acres amount to 20·4 of the total value of the county, a larger percentage than in any English county save one. Of the owners of more than 10,000 acres Lord Tollemahe of Helmingham

owns 25,380; the marquis of Cholmondeley, 16,842; the duke of Westminster, 15,001; Sir Henry Delves Broughton, 13,832; the Rev. T. France Hayhurst, 10,656; and Lord Crewe, 10,148; whilst Lord Egerton of Tatton, Lord Harrington, Lord Stamford and Warrington, L. Derby, Sir P. D. M. Grey Egerton, Lord Haddington, L. De Tabley, Lord Delamere, Lord Stanley of Alderley, L. Kilmorey, Lord Shrewsbury, Mr Legh of Lyme, Mr I. of Adlington, Mr R. E. Warburton, Sir Charles Shal and Mr Bromley Davenport make up the seventeen who are returned as owning between 5000 and 10,000 acres each. This list of landowners is composed of men whose names, with one exception, are historic in Cheshire, and in spite of the neighbourhood of Liverpool and Manchester have been the transfers of the large estates from the original owners to the capitalists of the present day.

For parliamentary representation the county is divided into East, West, and Mid Cheshire, each of the three sections returning two members to the House of Commons. In East Cheshire the registered electors in 1876 were 6,587; in Mid Cheshire, 8241; and in West Cheshire, 10,178. There are besides represented within the county the boroughs of Macclesfield and Birkenhead, and of the city of Chester, the limits of which extend into Wales, and parts of the boroughs of Warrington, Stockport, Ashton-under-Lyne, and Stalybridge, all of which are more or less into Lancashire. There is one court of quarter sessions in the county, which holds its meetings alternately at Chester and Knutsford, and is adjourned from one place to the other for the trial of prisoners at the assizes sessions. The rateable value of the county as assessed in the county rates is £2,690,701.

Perhaps no county has advanced more in material prosperity than Cheshire has in the last half-century. There are none have more places of public worship, both of the Church of England and of the various Nonconformist denominations been erected. In none have more schools been built. The wages of the agricultural labourers are high; and from the ranks of that body has the army of engineers, porters, high-class artificers, who are employed in the manufacturing districts and at Crewe, been largely recruited. Yet the county is cursed with the sin of drunkenness, with the evil consequences of that sin, in a fearful degree. Whilst serious crime has decreased steadily there has been an increase of all the light offences.

The history of Cheshire is intimately connected with the history of the city of Chester. In the time of King Alfred the present county formed part of the province of Mercia, but was afterwards separated, and by William the Conqueror was constituted a county-palatine. William bestowed the earldom on his nephew Hugo Lupus, and the title has belonged since then to the heir-apparent of the English Crown. The palatinate privileges existed intact until the reign of Henry VIII., when they were much curtailed in favour of the Crown, and after the Civil War of the Commonwealth they were almost wholly removed. The county was first represented in Parliament during the reign of Edward VI.

Two Roman roads traversed Cheshire, the north-west branch of Watling Street, running from Chester through Northwich to Stratford, where it crossed the Mersey into Lancashire, and the Via Devana which entered from Salterford and extended to Chester. Many handsome and interesting mansions exist in the county, some of them being admirable specimens of Elizabethan architecture. Among the most noteworthy may be mentioned Bramall Hall near Stockport, Brereton Hall near Sandbach, Crewe Hall, the seat of Lord Crewe, and Eaton Hall, the seat of the duke of Westminster. (G. W. L.)

CHESNE, ANDRÉ DU. See DUCHESNE.

CHESNEY, CHARLES CORNWALLIS (1826-1876), hrevet-colonel in the corps of Royal Engineers, born 29th September 1826, was the third son of Charles Cornwallis Chesney, captain on the retired list of the Bengal Artillery. Educated at Tiverton grammar school and Mount Radford school, Exeter, and afterwards at the Royal Military Academy, Woolwich, he obtained his first commission as second-lieutenant of engineers in 1845, passing out of the academy with distinction at the head of his term. His early service was spent in the ordinary course of regimental duty at home and abroad, and being stationed in New Zealand during the Crimean War, he lost the opportunity of serving in the only considerable military operations in Europe in which the present generation of British soldiers has been engaged, while India, the great school of war for the English army, was until lately closed to officers of the Royal Artillery and Engineers. Among the various reforms in our military system which followed from that war was the impetus given to military education; military history was now for the first time introduced into the course of instruction at our military colleges, and in 1858 Charles Chesney, who had brought himself under notice by an essay on the subject, prepared under a sort of competition invited by the authorities, was appointed professor of military history at Sandhurst. In 1864 Captain Chesney succeeded Colonel Handley in the corresponding chair at the Staff College. To the admirable teaching of these two officers may be ascribed in great measure the intelligent appreciation of the relation of military history to the practical business of war now manifested throughout the commissioned ranks of the British army; their published writings have been received with great favour on the Continent and in America.

Chesney's first published work was an account of the civil war in Virginia, which went through several editions; and although written in the heat of the struggle, and on the partial information then available, it may still be read with profit. But the work which attained the greatest reputation was his *Waterloo Lectures*, prepared from the notes of lectures orally delivered at the Staff College. Up to this time the English literature on the Waterloo campaign, although voluminous, was made up of personal reminiscences of actors in the great scene, or of formal records such as Siborne's accurate but tedious narrative, useful materials for history rather than history itself; the French accounts have mainly taken the form of fiction, the so-called history of Lamartine being as much a work of fancy as the romance of Victor Hugo, while the professedly sober pages of Thiers are not much more to be relied on. In Chesney's lucid and vigorous account of the momentous struggle, while it illustrates both the strategy and tactics which culminated in the final catastrophe, the mistakes committed by Napoleon are laid bare, and for the first time an English writer is found to point out that the dispositions of the great duke were not wholly faultless. Yet such criticism is in truth the sincerest praise, since to those who, knowing anything of war, know that even the highest combinations are at best a groping in partial darkness, the capacity of a great leader will be more perfectly appreciated by a right estimate of his mistakes than by a blind attribution of infallibility. And in the *Waterloo Lectures* the Prussians are for the first time credited by an English pen with their proper share in the victory. On this point there had hitherto been an English as well as a Napoleonic legend. The *Waterloo Lectures* attracted much attention abroad as well as at home; on the appearance of the French edition, published at Brussels, another account of the campaign, written at the instance of the emperor Napoleon III., and quite in the spirit of the Napoleonic legend, was published immediately afterwards in Paris in a

cover to correspond exactly with the Brussels edition, and with the obvious intention that it should circulate in place of the other,—a delicate test of the appreciation of the original on the part of the French Government.

Chesney was for many years a constant contributor to the newspaper press and to periodic literature, devoting himself for the most part to the critical treatment of military operations, and professional subjects generally. Some of his essays on military biography, contributed mainly to the *Edinburgh Review*, were afterwards published separately. His style is forcible, easy, and eminently clear, his judgment impartial and sagacious, and although his mode of treating military operations may be open to the criticism that it does not make sufficient allowance for the moral element in war—the infirmities of troops and the blunders of generals,—it may be said on the other hand that the whole truth is never told about battles at the time, and cannot be found out afterwards, and that in the long run the less there is of the personal in history, and the broader and more general the statement, the nearer will the historian come to describing what happened.

In 1868 Charles Chesney, who on promotion to field rank had returned to regimental duty, was appointed a member of the Royal Commission on Military Education which sat during that and the following year, under the presidency first of Earl de Grey and afterwards of Lord Dufferin, and to whose recommendations are due the improved organization of our military colleges, and the development of military education throughout the principal military stations of the British army. In 1871, immediately after the conclusion of the Franco-German war, he was sent on a special mission to France and Germany, and furnished to the Government a series of valuable reports on the different siege operations which had been carried out during the war, including especially the two sieges of Paris, and on the condition of the fortresses and military condition and organization of the two powers. These reports were published in a large volume, only a few copies of which have been issued confidentially.

Never seeking regimental or staff preferment, Colonel Chesney never obtained any, but he held at the time of his death a quite unique position in the army, altogether apart from and above his actual place in it. Consulted by officers of all grades on professional matters, his ready and vigorous pen was often placed at the service of the Government to illustrate and defend in the press the different measures of reform lately adopted in military organization: while probably few have done more to raise the intellectual standard of the English army and its estimation in that respect among the more intelligent spirits of foreign armies. Constantly engaged in literary pursuits, he was nevertheless laborious and exemplary in the discharge of his public duties, while managing also to devote a large part of his time to charitable and religious offices. He was abstemious to a fault; and, overwork of both mind and body telling at last on a frail constitution, he died after a short illness on the 19th March 1876, at the age of forty-nine years, to the regret of the whole army, and of a very large circle of friends both within and without the service, to whom he had become endeared in a remarkable degree by his generous, self-denying, and sympathetic disposition. At the time of his death he was serving as Commanding Royal Engineer of the London district.

Colonel Chesney's principal works were:—*A Military View of Recent Campaigns in Pyrenna and Maryland*, 1863; *Campaigns in Virginia and Maryland*, 2d edition, 1865; *The Military Resources of Prussia and France*, and *Recent Changes in the Art of War*; *Essays by Charles Chesney and Henry Reeve*, republished jointly from the *Edinburgh Review* 1870; *Waterloo Lectures*, 3d edition, 1874; *Essays in Modern Military Biography*, reprinted chiefly from the *Edinburgh Review*, 1874. (C. C.)

CHESS, simply defined, is an intellectual pastime. It recreates not so much by way of amusement properly so termed, as by taking possession of the mental faculties and diverting them from their accustomed grooves. The cerebral organ, after being much occupied in business, or greatly worried by cares, or in any way beset by painful reflections, finds in the absorbing and abstracting properties of chess that temporary relief which lighter pastimes will not always afford. The reason of this is not far to seek. Cares are caused by looking forward to or apprehending things to come, and, as such, are neutralized by that foresight which the conduct of a game of chess demands. Again, mental perturbations, however much varied, can but be the employment of the imagining and reasoning faculties in the digestion of the particular cause of annoyance or pain; but these same faculties are required, and their exclusive exercise demanded, in providing for the emergencies of the intellectual combat, and in solving the ever varying problems that arise in the course thereof. It is very commonly supposed that chess is a difficult game, whether to acquire or practise. This, however, is a mistake. The moves may be learned in half an hour, and a week's practice will evoke a sufficient amount of skill to afford pleasure both to the learner and his tutor. The intelligent novice will soon be convinced that an ignorant manipulation of the pieces does not conduce to success, and he will seek for instruction in the right manner of opening the game; the various débuts are after all simple, and he will find no difficulty in acquiring them one after the other. Six months will suffice for this purpose if his understanding be not enslaved by obstinacy, indolence, or self-esteem, and the rest goes with his natural capacity. A merely average intelligence is sufficient for a very fair amount of proficiency and strength; while intellect not much above the common mean will suffice (assuming here natural aptitude) to lead right up to the second class of players, viz., those to whom the masters of the game can only concede the small odds of "pawn and move." Those wishing to improve will find it very beneficial to play upon even terms with players stronger than themselves; for a persistence in taking odds, besides having a discouraging and debilitating effect upon the weaker player, takes the game out of its proper grooves, and tends to produce positions not naturally arising in the ordinary course of the game as developed from the recognized openings. In fact, the reception of odds incapacitates a player from acquiring an insight into the principles of the science of chess, and from comprehending the latent meanings and conceptions upon which combinations and a proper plan of warfare are founded; while, upon the contrary, playing on even terms throws the combatant at once upon his own judgment, and by causing him to study his opponent's play, leads necessarily to a material improvement in his own style.

To turn now to the elements of the game. The accompanying diagrams represent chess boards, and it will be perceived that they respectively consist of sixty-four chequered squares

In diagram 1 the chessmen are arranged as they should be at the commencement of the battle, while diagram 2 shows the denomination of the squares according to the English and German systems of notation, to be explained hereafter. Under diagram 1 are the names of the various "Pieces," for so the superior officers are termed—each side, white and black, having a king, a queen, two rooks, two knights, and two bishops. The eight common men in front are called Pawns.

MOVES OF THE DIFFERENT CHESSMEN.—Briefly described, the powers of the various pieces and of the pawns are as follows.

The king may move in any direction—forward, back-

ward, laterally, or diagonally; but never more than one square at a time. Under certain conditions, however, he may move two squares at a time.

DIAGRAM 1.—Showing the arrangement of the pieces at the commencement of a game.

the game a peculiar privilege called castling, which will be explained further on.

The queen moves in any straight or diagonal direction, whether forward, backward, or laterally. There is no limit to her range, except when her progress is stopped by a piece or pawn. She is the most powerful piece on board, for her action is a union of those of the rook

DIAGRAM 2.—Showing English and German Methods of Notation.

bishop. At the commencement of the game the queen always stands upon a square of her own colour.

The rooks move in straight lines—forward, backward, laterally; they cannot move diagonally. Their range is, like the queen's, unlimited.

The bishops move diagonally in any direction whether backward or forward. They have an unlimited range, with the same exception as before. It is evident that

CHESNEY, Chained on differently coloured squares colonel in the ec

September 1826, a mode of moving which it is not easy Chesney, captain r range is not unlimited, like that of the Educated at Tivel, but is restricted in a particular way. school, Exeter, one corner of any rectangle of three Academy, Woolthe opposite corner; thus, in diagram 3, second-lieutenant can move to the square academy with the black one and vice versa. early service the move further, suppose duty at horam 2 a knight stands on the Zealand durd K4 counting from the white of serving inward; that knight can move to Europe following squares, viz., to K B 2, has K Kt 3, Q B 3, K Kt 5, Q B 5, K B 6 and Q 6. The squares which the knight appears to pass over in moving may be occu-

Diagram 3.

occupied by other pieces, but his move has no thing whatever to do with those intervening squares. A knight may thus vault over any piece or pawn, whether adverse or friendly; the knights are the only pieces which possess this privilege. It will be perceived, that the *locus* of the knight, unlike that of the bishop, changes colour at every move.

The king, queen, rooks, and bishops may capture any foeman which stands anywhere within their respective ranges; and the knights can capture the adverse men which stand upon the squares to which they can leap. A capture is effected by the piece which takes occupying the square of the piece which is taken, the latter being then removed from the board. The king cannot capture any man which is protected by another man.

The motions and capturing powers of the pawns are as follows:—Each pawn for his first move may advance either one or two squares straight forward, but afterwards one square only, and this whether upon starting he exercised his privilege of moving two squares or not. A pawn can never move backwards. He can only capture diagonally,—that is to say, if any adverse piece or pawn stand upon the first diagonal square, either to right or left, such adverse piece or pawn can be captured and removed from the board, the captor taking its place, but a pawn cannot take any man standing directly in front of it. In other words, a pawn moves straight forward except when he captures, in which case he moves diagonally, and for capturing purposes he can only, even for his first move, advance one square. When a pawn arrives at an eighth square, viz., at the extreme limit of the board, he may be promoted, that is to say, he may, at the option of his owner, become a queen, rook, bishop, or knight; and it matters not how many queens or other pieces a player may have on the board at one time.

CHECK AND CHECKMATE.—The king can never be captured, but when any piece or pawn attacks him, he is said to be “in check,” and the fact of his being so attacked should be announced by the adverse player saying “check,” whereupon the king must move from the square he occupies, or be screened from the check by the interposition of one of his own men, or the attacking piece must be captured. If, however, the king, being thus in check, cannot move to another square without being still in check, and there is no piece or pawn which can be interposed, and the checking piece or pawn cannot be taken, then it is “checkmate,” whereupon the game terminates, the player whose king has been thus checkmated being the loser. The position of the king when in check being the same as that of any piece when exposed to be captured, with the only difference that the king cannot be taken, it follows that the pawn gives check just in the same way that he captures, viz., diagonally. One king cannot give check to the other, nor can a king be moved into check.

STALEMATE.—When the king is not in check, but his owner has no move left *savo* such as would place the king in check, this is “stalemate,” and the game is drawn.

CASTLING.—This is a peculiar move permitted to the king once in the game; it is performed in combination with either the king's rook or the queen's rook, and in either case by the king being moved two squares laterally, while the rook is placed on the other side of him. But the king cannot castle after having been moved, nor with a rook that has moved, nor when any piece either white or black stands between him and the rook, nor if he is in check, nor when he has to cross over a square commanded by an adverse piece or pawn; the rook can, however, move from or cross over such a square. It will be perceived that after castling with the king's rook the latter will occupy the K B square, while the king stands on the K Kt square, and if with the queen's rook, the latter will occupy the queen's square while the king stands on the Q B square. This move will easily be understood with the aid of diagram 2.

TAKING EN PASSANT.—This is a privilege possessed by any of the pawns under the following circumstances:—If a pawn, say of the white colour, stands upon a fifth square, say upon K 5 counting from the white side, and a black pawn in the supposed case moves to Q 4 or K B 4 counting from the black side, the white pawn can take the black pawn “en passant.” For the purposes of such capture the latter is dealt with as though he had only moved to Q 3 or K B 3, and the white pawn taking him diagonally then occupies the square the captured pawn would have reached had he moved but one square.

DRAWN GAME.—This arises from a stalemate (noticed above), or from either player not having sufficient force wherewith to effect checkmate, as when there are only two kings left on the board, or king and bishop against king, or king and one or even two knights against king. The same consequence follows from either player being able to give perpetual check to the adverse king. There are also cases in which one of the players can call upon the other to give checkmate in fifty moves, the result of failure being that the game is drawn. The right to make this requisition arises in various positions, to explain all of which would take up much space; it is sufficient to say that when neither side has any pawns left on the board the player with the inferior force may make the fifty moves call.

OTHER CHESS TERMS.—A “minor piece” means either a knight or bishop. “Gaining the exchange” signifies giving a minor piece in exchange for a rook. A “passed pawn” is one that has no adverse pawn either in front or on either of the adjoining files. It may be as well to explain that a “file” is simply a line of squares extending vertically from one end of the board to the other. There are therefore eight files, and they are respectively named after the pieces which occupy the first squares on either side, as, e.g., the “king's file,” which extends from one king to the other, and so forth. An “open file” is one on which no piece or pawn of either colour is standing. “Gambit” is a word derived from the Italian *gambetto*, a tripping up of the heels; it is a term used to signify an opening in which a pawn is sacrificed to obtain an attack. An “opening,” or “début,” is a certain set method of commencing the game; there are regular and irregular openings. A “check by discovery” is given when a player, by moving one of his pieces, checks with another of them. “Double check,” as its name implies, means attacking the king at once with two pieces,—one of the pieces in this case giving check by discovery.

VALUE OF THE PIECES.—The relative worth of the chess-men cannot be definitely stated on account of the increase or decrease of their powers according to the position of the

game, but striking an average, and taking the pawn as the unit, the following will be an estimate near enough for practical purposes:—pawn 1, bishop 3.25, knight 3.25, rook 5, queen 9.50. Three minor pieces may more often than not be advantageously exchanged for the queen. The knight is generally stronger than the bishop in the end game, but two bishops are usually stronger than two knights, more especially in open positions.

LAWS.—The laws of chess differ, although not very materially, in different countries. Various steps have been taken, but as yet without success, to secure the adoption of a universally authoritative code. In competitions among English players the particular laws to be observed are specially agreed on,—the regulations most generally adopted being those laid down at length in Staunton's *Chess Praxis*, or the modification of the *Praxis* laws issued in the name of the British Chess Association in 1862.

The following rules may be here indicated. The board must be so placed that each combatant has a white square in his right hand corner. A player touching any of his own men or those of his adversary (except accidentally) without previously saying "*j'adoube*," or "I adjust," or words to that effect, may be compelled to move or capture (as the case may be) the man so touched; if this cannot be done he must move his king, but if that be likewise impossible, there is then no penalty. If a player make a false or illegal move or capture, he must, at the choice of his opponent, and according to the case, move his own man legally, capture the man legally, or move any other man legally movable. In practice, the usual demand is that the offender shall move his king. After four moves have been made on each side, any such illegality is waived, and the game must be played out as it stands. Should the king be left in check, all the moves subsequently made must be retraced and the check replied to.

MODES OF NOTATION.—The English and German systems of notation (*i.e.*, the manner of describing the moves made in a game) are different. According to the English method each player counts from his own side of the board, and the moves are denoted according to the names of the files and the numbers of the squares. Thus when a player for his first move advances the king's pawn two squares, it is described as follows:—"1 P to K 4;" for the pawn has moved to the fourth square of the king's file. The following moves of the Giuoco Piano Opening, with the aid of diagram 2, will enable the reader to understand the principles of the British notation, wherein it may also be observed that only the initials of the pieces are now used:—

WHITE.

1. P to K 4
2. K Kt to K B 3
(*i.e.*, King's Knight to the third square of the King's Bishop's file.)
3. K B to Q B 4
(King's Bishop to the fourth square of the Queen's Bishop's file.)
4. P to Q B 3
(Pawn to the third square of the Q B file.)
5. P to Q 4
(Pawn to the fourth square of the Queen's file.)
6. P takes P
(Queen's Bishop's Pawn takes Pawn at the fifth square of the adverse Queen's file.)

BLACK.

1. P to K 4
2. Q Kt to Q B 3
(*i.e.*, Queen's Knight to the third square of the Queen's Bishop's file.)
3. K B to Q B 4
(same as White's third move.)
4. K Kt to K B 3
(same as White's second move.)
5. P takes P
(King's Pawn takes White's Queen's Pawn.)
6. K B to Q Kt 5 (ch)
(King's Bishop to the fifth square of the Queen's Knight's file, giving check to the White King.)

It is now usual to express the notation as concisely as possible; thus, the third moves of White and Black would

be given as 3 B to B 4, because it is clear that only the fourth square of the queen's bishop's file is intended. In like manner White's fourth move would be described as 4 P to B 3, and Black's fourth move as 4 Kt to B 3. Sometimes instead of the word "takes" a cross is used, thus—6 P × P.

The German notation employs the alphabetical characters *a, b, c, d, e, f, g, and h*, proceeding from left to right, and the numerals 1, 2, 3, 4, 5, 6, 7, and 8, running upwards, these being always calculated from the White side of the board (see diagram 2). Thus the White Queen's Rook's square is *a1*; the Black Queen's Rook's square, *a8*; the White Queen's square is *d1*; the Black Queen's square, *d8*; the White King's square, *e1*; the Black King's square, *e8*, and so with the other pieces and squares. The German names of the pieces are as follows:—King, *König*; Queen, *Dame*; Rook, *Thurm*; Bishop, *Läufer*; Knight, *Springer*; Pawn, *Bauer*.

The initials only of the pieces are given, the pawns (*Bauern*) being understood. The Germans use the following signs in their notation, viz.:—for "check" (+); "check-mate" (#); "takes" (:); "castles on King's side" (0-0); "castles on Queen's side" (0-0-0); for "best move" a note of admiration (!); for "weak move" a note of interrogation (?). The Giuoco Piano Opening moves just rendered in the English will now be given in the German notation, which will make the latter easily intelligible:—

WHITE.

1. e2-e4
2. S g1-f3
3. L f1-c4
4. c2-c3
5. d2-d4
6. c3-d4:

BLACK.

1. e7-e5
2. S b8-c6
3. L f8-c5
4. S g8-f6!
5. e5²d4:
6. L c5-b4+

Both in the English and German notations the moves are often rendered in a tabular form, thus:—1. $\frac{P \text{ to } K 4}{P \text{ to } K 4}$

1. $\frac{e2-e4}{c7-e5}$, the moves above the line being White's and below the line Black's.

ILLUSTRATIVE GAMES.—There are various text-books upon the beginnings and endings of games, to one or other of which the learner should have recourse. Some of them are mentioned further on; but it would be invidious to enter upon any comparison of merits, or to recommend any work in particular. The following are given as indicative illustrations of certain of the leading openings; but, necessarily, no attempt can be made here to impart detailed instruction on this important branch of the game:—

Giuoco Piano.

WHITE.

1. P to K 4
2. K Kt to B 3
3. B to B 4
4. P to B 3
5. P to Q 4
6. P takes P
7. B to Q 2
8. Q Kt takes B
9. P takes P
10. Q to Kt 3
11. Castles (K's side)

BLACK.

1. P to K 4
2. Q Kt to B 3
3. B to B 4
4. Kt to K B 3
5. P takes P
6. B to Kt 5 (ch)
7. B takes B(ch)
8. P to Q 4
9. K Kt takes P
10. Q Kt to K 2
11. Castles

Even game.

Ruy Lopez.

WHITE.

1. P to K 4
2. K Kt to B 3
3. B to Kt 5

BLACK.

1. P to K 4
2. Q Kt to B 3
3. P to Q R 3

- | WHITE. | BLACK. |
|-----------------|----------------|
| 4. B to R 4 | 4. Kt to B 3 |
| 5. P to Q 4 | 5. P takes P |
| 6. P to K 5 | 6. Kt to K 5 |
| 7. Castles | 7. B to K 2 |
| 8. R to K sq | 8. Kt to B 4 |
| 9. B takes Kt | 9. Q P takes B |
| 10. Kt takes P | 10. Castles |
| 11. Kt to Q B 3 | 11. P to K B 3 |

Even game.

Scotch Gambit.

- | WHITE. | BLACK. |
|----------------|----------------|
| 1. P to K 4 | 1. P to K 4 |
| 2. K Kt to B 3 | 2. Q Kt to B 3 |
| 3. P to Q 4 | 3. P takes P |
| 4. B to Q B 4 | 4. B to B 4 |
| 5. P to B 3 | 5. Kt to B 3 |
| 6. P takes P | |

The position here arrived at is the same as in the Giuoco Piano opening above.

Evans Gambit.

- | WHITE. | BLACK. |
|----------------|-----------------|
| 1. P to K 4 | 1. P to K 4 |
| 2. K Kt to B 3 | 2. Q Kt to B 3 |
| 3. B to B 4 | 3. B to B 4 |
| 4. P to Q Kt 4 | 4. B takes Kt P |
| 5. P to B 3 | 5. B to B 4 |
| 6. P to Q 4 | 6. P takes P |
| 7. Castles | 7. P to Q 3 |
| 8. P takes P | 8. B to Kt 3 |

White has for his ninth move three approved continuations, viz., B to Kt 2, P to Q 5, and Kt to B 3. To take one of them,—

- | | |
|-----------------|----------------|
| 9. P to Q 5 | 9. Kt to R 4 |
| 10. B to Kt 2 | 10. Kt to K 2 |
| 11. B to Q 3 | 11. Castles |
| 12. Kt to B 3 | 12. Kt to Kt 3 |
| 13. Kt to K 2 | 13. P to Q B 4 |
| 14. Q to Q 2 | 14. P to B 3 |
| 15. K to R sq | 15. B to B 2 |
| 16. Q R to B sq | 16. R to Kt sq |

The game may be considered about even.

King's Knight's Gambit (proper).

- | WHITE. | BLACK. |
|----------------|----------------|
| 1. P to K 4 | 1. P to K 4 |
| 2. P to K B 4 | 2. P takes P |
| 3. K Kt to B 3 | 3. P to K Kt 4 |
| 4. B to B 4 | 4. B to Kt 2 |
| 5. Castles | 5. P to Q 3 |
| 6. P to Q 4 | 6. P to K R 3 |
| 7. P to B 3 | 7. Kt to K 2 |

Black has the advantage.

Allgaier-Kieseritzki Gambit.

- | WHITE. | BLACK. |
|----------------|----------------|
| 1. P to K 4 | 1. P to K 4 |
| 2. P to K B 4 | 2. P takes P |
| 3. Kt to K B 3 | 3. P to K Kt 4 |
| 4. P to K R 4 | 4. P to Kt 5 |
| 5. Kt to K 5 | 5. K Kt to B 3 |
| 6. B to B 4 | 6. P to Q 4 |
| 7. P takes P | 7. B to Kt 2 |
| 8. P to Q 4 | 8. Castles |
| 9. B takes P | 9. Kt takes P |
| 10. B takes Kt | 10. Q takes B |
| 11. Castles | 11. P to Q B 4 |

Black has the better game.

King's Bishop's Gambit.

- | WHITE. | BLACK. |
|----------------|--------------------|
| 1. P to K 4 | 1. P to K 4 |
| 2. P to K B 4 | 2. P takes P |

| 2. P to Q B 4 | 2. P takes P |
| 3. P to K 3 | 3. P to K 4 |
| 4. B takes P | 4. P takes P |
| 5. P takes P | 5. B to Q 3 |
| 6. Kt to K B 3 | 6. Kt to K B 3 |

WHITE.

7. Castles
8. P to K R 3
9. Kt to Q B 3

BLACK.

7. Castles
8. P to K R 3
9. P to Q B 3

The game is about equal, though White has a somewhat freer position.

The two following games are brilliant specimens of the style of those eminent players, Herr Anderssen and Mr Paul Morphy. The manner in which White in the first game forces the victory, though losing piece after piece, scarcely finds a parallel in the records of chess strategy.

King's Bishop's Gambit.

And White resigns.

END-GAMES AND PROBLEMS.—Considerable attention has been devoted by writers on chess to the examination of end-games, and many of the particular combinations of forces that are apt to occur have been fully and carefully analyzed. The study of and taste for problems have

become very general in the chess community, especially within the last twenty years; and to minister to the growing public demand for such compositions is now an important function of chess periodicals, and of the numerous serial publications that devote a column to chess. The six problems given below¹ are prize-winners. The solutions (necessarily the leading variations only) will be found at the close of the article, p. 603.

VARIOUS THEORIES AS TO THE INVENTION OF CHESS.—The origin of the game of chess is lost in obscurity, a fact which has rather invited than repelled learned speculations on the subject. The invention of the pastime has been variously ascribed to the Greeks, Romans, Babylonians, Seythians, Egyptians, Jews, Persians, Chinese, Hindus,

¹ PROBLEM No. 1.

By J. Kling.

(Adjudged the best two-move problem of the British Chess Association Tourney, 1872).

WHITE.

White to play and mate in two moves.

PROBLEM No. 2.

By the Rev. George M'Arthur.

(The prize problem of the Cambridge Tourney, 1860.)

BLACK.

WHITE.

White to play and mate in three moves.

Arabians, Araucanians, Castilians, Irish, and Welsh. Not content with upholding the claims of nations or races, some have endeavoured to fix upon particular individuals as the originators of the game; and, amongst others, the following have found supporters:—Japhet, Shem, King Solomon, the wife of Ravan king of Coylon, the philosopher Xerxes, the Grecian prince Palamedes, Hermes, Aristotle, the brothers Lydo and Tyrrhene, Semiramis, Zenobia, Attalus who died about 200 B.C., the mandarin Hansing, the Brahman Sissa, and Shatrenscha, stated to be a celebrated Persian astronomer. Many of these ascriptions are of course fabulous, others rest upon little authority, and some of them proceed from easily traceable errors, so whose the Roman games of *Ludus Latruncularum* and *Ludus Calculorum*, the Welsh recreation of *Tauwlwrdd*, i.e.,

throw-board, and the ancient Irish pastime of *Fithcheall* are assumed to be synonymous with chess; whereas, so far as the Romans and Welsh are concerned, the contrary can be proved, while from what little is known of the Irish game it appears not to have been a sedentary game at all, but most likely an open-air recreation. The claims of the Chinese were advocated in a letter addressed by Mr Eyles Irwin in 1793 to the Earl Charlemont. This paper was published in the *Transactions of the Royal Irish Academy*, and its purport was that chess, called in the Chinese tongue *chong-ki*, which, according to Mr Irwin, means the "royal game," was invented in the reign of Kao Tsu, otherwise Lin Pang, then king, but afterwards emperor of Kiangnan, by a mandarin named Hansing, who was in command of an army invading the Shensi country, and who wanted to

WHITE.

White to play and mate in five moves.

amuse his soldiers when in winter quarters so that they might no longer clamour to return home. According to the narrative, this invasion of the Shensi country by Hansing took place about 174 B.C. Captain Hiram Cox, in a commentary upon the above letter, states that the game is called by the Chinese *choke-choo-hong ki*, literally, "the play of the science of war." (See also a paper published by the Hon. Daines Barrington in the 9th vol. of the *Archæologia*.) Mr N. Bland, M.R.A.S., in his *Persian Chess* (London, 1850), endeavours to prove that the Persians were the inventors of chess, and he maintains that the game, after being born in Persia, found a home in India, whence, after a series of ages, it was brought back to its original birth-place. The view, however, which has been most seriously put forward, and which has obtained the most credence, is that which attributes the origin of chess to the Hindus. Dr Hyde of Oxford, writing in 1694 (*De Ludis Orientalibus*), seems to have been the first to propound this theory. He, however, laboured under two somewhat serious disadvantages; he appears to have been ignorant of the game itself, and the treasures of ancient Hindu knowledge contained in Sanskrit records were not accessible in his time. About 1783-89 Sir William Jones took up the mantle of Hyde, and in an essay published in the 2d vol. of *Asiatic Researches*, argued that Hindustan was the cradle of chess, the game having been known there from time immemorial by the name of *chaturanga*, that is, the four "angas," or members of an army which are said in the *Amarakosha* to be elephants, horses, chariots, and foot soldiers. As applicable to real armies, the term *chaturanga* is frequently used by the epic poets of India. Sir William Jones was resident in Bengal, and was president of the Asiatic Society of that province; he commenced the study of Sanskrit to assist him in his judicial functions, and was the first who possessed real and profound knowledge of that language; he was, besides, well acquainted with and fond of chess, so that altogether he was more advantageously situated than Hyde for forming an opinion upon the matter. His essay is substantially a translation of and a commentary upon the *Bhāviṣya Purāna*, in which is given a description of a four-handed game of chess played with dice. A pundit named Rhadhakant informed him that this was mentioned in the oldest law books, as also that it was invented by the wife of Ravau, king of Lanka (Ceylon), in the second age of the world, in order to amuse that monarch while Rama was besieging his metropolis. This account claims for chess an existence of 4000 or 5000 years. Sir William, however, grounds his opinions as to the Hindu origin of chess upon the testimony of the Persians, and not upon the above manuscript; while he considers the game described therein to be more modern than the Persian game. Though sure that the latter came from and was invented in India, he yet, with commendable candour, admits that he could not find any account of it in the classical writings of the Brahmins. He lays it down that chess under the Sanskrit name *chaturanga* was exported from India into Persia in the 6th century of our era; that by a natural corruption the old Persians changed the name into *chatrang*, but their country was soon afterwards taken possession of by the Arabs, who had neither the initial nor final letter of the word in their alphabet, wherefore, they altered it farther into *Shatranj*, which name found its way presently into the modern Persian, and ultimately into the dialects of India.

So far Sir William Jones; but Captain Hiram Cox, in a letter upon Burmese chess, written in 1799, and published in the 7th vol. of *Asiatic Researches*, refers to the above essay, and considers the four-handed game described in the above-mentioned Sanskrit manuscript to be the most ancient form of chess,—the Burmese and Persian games

coming successively second and third in order of precedence. Later on, viz., in the 11th and 24th vols. of the *Archæologia*, Mr Francis Douce and Sir Frederick Madden expressed themselves in favour of the views held by Hyde and his followers.

This brings us to the issue of Professor Duncan Forbes's *History of Chess*, in 1860, in which Captain Cox's views, as founded upon Sir William Jones's Sanskrit manuscript are upheld and developed into an elaborate theory. Professor Forbes holds that the four-handed game of *chaturanga* described in the *Bhāviṣya Purāna* was the primeval form of chess; that it was invented by a people whose language was Sanskrit (i.e., the Hindus); and that it was known and practised in India from a time lost in the depths of a remote antiquity, but, as he considers, for a period the duration of which may have been from 3000 to 4000 years before the 6th century of the Christian era. He endeavours to show, though certainly quite speculatively, for he adduces no proof, how the four armies commanded by four kings in Sir William Jones's manuscript became converted into two opposing armies, on which conversion he says that two of the kings were reduced to a subordinate position, and became "monitors" or "counsellors," one standing by the side of the white and the other of the black king, these counsellors being the *farzins* from which we derive our queens. Among other points he argues, apparently with justice, that *chaturanga* was evidently the root of *shatranj*, for the latter word he states is a mere exotic in the language of the inhabitants of Persia, defying all the ingenuity of their grammarians to make it their own.

Van der Linde, in his exhaustive work, *Geschichte und Litteratur des Schachspiels* (Berlin, 1874), has much to say of the origin theories, nearly all of which he treats as so many myths. He agrees with those who consider that the Persians received the game from the Hindus; but the elaborate *chaturanga* theories of Forbes receive but scant mercy at the hands of the learned Dutch author. Van der Linde argues that *chaturanga* is always used of an army, and never of a game, by the old Indian poets; that all Sanskrit scholars are agreed that chess is mentioned in none of the really ancient Hindu records; that the *Purānas* generally, though formerly considered to be extremely old, are held in the light of modern researches to reach no further back in reality than the 10th century,—while, moreover, the copies of the *Bhāviṣya Purāna* which are in the British Museum and Berlin Library do not contain the extract relied upon by Forbes, though it is to be found in the *Raghunandana*, which was translated by Weber in 1872, and is stated by Bühler to date from the 16th century. The ultimate outcome of Van der Linde's studies appears to be that chess certainly existed in Hindustan in the 8th century, and that probably that country is the land of its birth. While putting forth nothing as positive which cannot be proved, he inclines to the idea that the game originated among the Buddhists, whose religion was prevalent in India from the 3d to the 9th century. According to their ideas, war and the slaying of one's fellow-man, for any purpose whatever, is criminal, and the punishment of the warrior in the next world will be much worse than that of the simple murderer; but they ministered to the combative propensities of human nature by inventing the bloodless warfare of chess as a harmless imitation of and a substitution for the carnage of the battle-field. In opposition to Forbes, therefore, and agreeing with Sir William Jones, Van der Linde takes the view that the four-handed game of the above-mentioned manuscript is a comparatively modern adaptation of the primal Hindu chess, and he altogether denies that there is any proof of the game in whatever form having the antiquity

attributed to it. Certainly, internal evidences seem to contradict the view of Sir William Jones's manuscript being a very ancient testimony; for it mentions two great sages, Vyasa and Gotama, the former as teaching *chaturanga* to Prince Yndhishtira, and the other as giving an opinion upon certain principles of the game; but this could not well be, seeing that it was played with dice, and all games of hazard were positively forbidden by Menu. It would appear also that Indian manuscripts cannot be absolutely relied on in evidence of the antiquity of their contents; for the climate has the effect of destroying such writings in a period of 300 or 400 years. They must therefore be from time to time re-copied, and in this way later interpolations might easily creep in.

Von der Lasa, who had, in an article prefixed to the *Handbuch* in 1864, accepted Forbes's views, withdraws his support in a review of the work just noticed, published in the September and November numbers of the *Deutsche Schachzeitung*, 1871, and expresses his adherence to the opinions set forth by Van der Linde.

Altogether, therefore, we find the best authorities agreeing that chess existed in India before it is known to have been played anywhere else,—a fact which naturally leads them to fix upon that country as its probable birth-place. In this supposition they are strengthened by the names of the game and of some of the pieces. *Shatranj*, as Forbes has well pointed out, is a foreign word among the Persians and Arabians, whereas its natural derivation from the term *chaturanga* will strike an ordinarily educated as well as a scholarly mind. Again, *al-fil*, the Arabic name of the bishop, means the elephant, otherwise *aleph-hind*, the Indian ox. As to how long chess has really existed, unless we choose to rely upon evident myths and old fables, we shall find no ground whatever for attributing to it the great antiquity that some have maintained. Our earliest authority is Masudi, an Arabic author who wrote about 950 A.D. According to him, *shatranj* had existed long before his time; but the spirit of historic criticism will not permit of our unreservedly accepting his testimony in that regard. Say that he may speak not only for his own generation but for a couple of centuries before, and that will give an existence to chess of over a thousand years, a respectable period of time enough, and one to be satisfied with until a greater duration be proved.

CHESS IN EARLY AND MEDIEVAL TIMES.—The dimness which shrouds from view the origin of chess naturally obscures also its early history. All kinds of fables and legends lie in the way of the inquirer, and obstruct his progress, so that until a comparatively recent date a firm historical foundation is not to be found. We have seen that chess crossed over from India into Persia, and became known in the latter country by the name of *shatranj*. Some have understood that word to mean "the play of the king;" but undoubtedly Sir William Jones's derivation carries with it the most plausibility, if indeed his reasons may not be said to amount to a demonstration of the correctness of his view. But how and when the game was introduced into Persia we have no means of knowing. True, the Persian poet Firdusi, in his historical poem, the *Shahnama*, gives an account of the introduction of *shatranj* into Persia in the reign of Nanshirawan (Chosroes), to whom came ambassadors from the sovereign of Hind, i.e., India, with a chess-board and men, asking him to solve if he could the secrets of the game, and otherwise to pay tribute. Nanshirawan was the contemporary of Justinian, and reigned in the 6th century of our era. Professor Forbes seems to think that this poem may be looked upon as substantially an authentic history and credited as such. This appears, however, to be somewhat dangerous, especially as Firdusi lived some 450 years

after the supposed event took place. Other Persian and Arabian writers state that *shatranj* came into Persia from India, and there appears, as we have seen, such a consensus of opinion as may be considered to settle that part of the question. We have then the game passing from the Hindus to the Persians, thence to the Arabians after they took possession of Persia in the 7th century, and from whom directly or indirectly it came to various parts of Europe, at a time which cannot be definitely fixed upon, but which was either in or before the 11th century. That the source of the European game is Arabic is clearly enough deducible, not merely from the words "check" and "mate," which are evidently from *Shāh māt*, but also from the names of some of the pieces, to be noticed further on. There are various chess legends having reference to the 7th and 8th centuries, but these may be passed by as presenting no appearance of historical verity; and equally unworthy of credence appear the many Oriental and Occidental romances which revolve around those two great central figures, Harun al Rashid and Charlemagne. There is no proof that either of them knew anything of chess, or, so far as the latter is concerned, that it had been introduced into Europe in his time. True, there is an account given in Gustavus Selenus, taken from various old chronicles, as to the son of Prince Okar or Otkar of Bavaria having been killed by a blow on the temple struck by a son of Pepin after a game of chess; and there is another well-known tradition as to the magnificent chess-board and set of men said to have been sent over as a present by the Empress Irene to Charlemagne. But both tales are not less mythical than the romance which relates how the great Frankish monarch lost his kingdom over a game of chess to Guerin de Montglave; for Van der Linde shows that there was no Bavarian prince of the name of Okar or Otkar at the period alluded to, and in an equally relentless manner the sceptical Dutch writer breaks down the tradition about Irene's chessmen. With respect to Harun al Rashid, among the various stories told which connect him with chess, there is one that at first sight may seem entitled to some degree of credit. In the annals of the Moslems by Abulfeda, there is given a copy of a letter stated to be "From Nicephorus, emperor of the Romans, to Harun, sovereign of the Arabs," which (using Professor Forbes's translation) after the usual compliments, runs thus:—"The empress (Irene) into whose place I have succeeded, looked upon you as a *Rukh* and herself as a mere *Pawn*, therefore she submitted to pay you a tribute more than the double of which she ought to have exacted from you. All this has been owing to female weakness and timidity. Now, however, I insist that you, immediately on reading this letter, repay to me all the sums of money you over received from her. If you hesitate, the sword shall settle our accounts." Harun's reply, written on the back of the Byzantine emperor's letter, was terse and to the point. It ran thus:—"In the name of God the merciful and gracious. From Harun, the commander of the faithful, to the Roman dog Nicephorus. I have read thine epistle, thou son of an infidel mother; my answer to it thou shalt see, not hear." Harun was as good as his word, for he marched immediately as far as Heraclea, devastating the Roman territories with fire and sword, and soon compelled Nicephorus to sue for peace. Now the points which give authority to this narrative and the alleged correspondence are that the relations which they assume between Irene and Nicephorus on the one hand and the warlike caliph on the other are confirmed by the history of those times, while, also, the straightforward brevity of Harun's reply commends itself as what one might expect from his soldier-like character. Still, the fact must be remembered, that Abulfeda lived about five centuries after the time to which he refers.

Perhaps we may assume it to be not improbable that the correspondence is genuine; but the words "rukhi" and "pawn" may have been substituted for other terms of comparison originally made use of.

As to how chess was introduced into Western and Central Europe nothing is really known. The Spaniards very likely received it from their Moslem conquerors, the Italians not improbably from the Byzantines, and in either case it would pass northwards to France, going on thence to Scandinavia and England. Some say that chess was introduced into Europe at the time of the Crusades, the theory being that the Christian warriors learned to play it at Constantinople. This supposition is negatived by a curious epistle of Cardinal Damianus, bishop of Ostia, to Pope Alexander II. written about 1061 A.D., which, assuming its authenticity, shows that chess was known in Italy before the date of the first crusade. The cardinal, as it seems, had imposed a penance upon a bishop whom he had found diverting himself at chess; and in his letter to the Pope he repeats the language he had held to the erring prelate, viz., "Was it right, I say, and consistent with thy duty, to sport away thy evenings amidst the vanity of chess, and defile the hand which offers up the body of the Lord, the tongue that mediates between God and man, with the pollution of a sacrilegious game?" Following up the same idea the statutes of the church of Elua, in the 3d vol. of the *Councils of Spain*, say, "Clerks playing at dice or chess shall be *ipso facto* excommunicated." Eudes de Sully, bishop of Paris under Philip Augustus, is stated in the *Ordonn. des Rois de France*, to have forbidden clerks to play the game, and according to the *Hist. Eccles. of Fleury*, St Louis king of France condemned to a fine all who should play it. Ecclesiastical authorities, however, seem to have differed among themselves upon the question whether chess was or was not a lawful game according to the canons, and Peirino, *De Pralat.* chap. 1, holds that it was permissible for ecclesiastics to play thereat. Among those who have taken an unfavourable view of the game may be mentioned John Huss, who, when in prison, deplored his having played at chess, whereby he had lost time and risked being subject to violent passions. Among authentic records of the game may be quoted the *Alexiad* of the Princess Anna Comnena, in which she relates how her father, the Emperor Alexius, used to divert his mind from the cares of state by playing at chess with his relatives. This emperor died in 1118. Concerning chess in England there is the usual mangle of the legendary and the possibly true. Snorre Sturleson relates that as Canute was playing at chess with Earl Ulfr, a quarrel arose, which resulted in the latter upsetting the board, with the further consequence of his being murdered in church a few days afterwards by Canute's orders. Carlyle, in his recent work, *The Early Kings of Norway*, repeats this tale, but Van der Linde treats it as a myth; and certainly the act imputed to the great-minded Dane seems altogether inconsistent with his character. The *Ramsey Chronicle* relates how Bishop Utheric, coming to Canute at night upon urgent business, found the monarch and his courtiers recreating themselves at dice and chess. There is nothing intrinsically improbable in this last narrative; but Canute died about 1035, and the date therefore is suspiciously early. Moreover, allowance must be made for the ease with which chroniclers turned other games, such as tables, &c., into chess. William the Conqueror, Henry I., John, and Edward I. are variously stated to have played at chess, but such assertions must be taken *quantum valeant*. Not devoid of plausibility is the allegation that the Court of Exchequer derives its name from *Eschiquier*; though whether, in support of the same idea, we are to believe, as is stated by an old writer, that

at the coronation of Richard I. in 1189, six earls and barons carried a chess-board with the royal insignia to represent the said court is another thing. According to Edmonson's *Heraldry*, twenty-six English families bore chess rooks in their coats of arms. Altogether, strewed about the chronicles and writings of the Middle Ages are many allusions to the game, but the subject cannot be further elucidated here; though a word or two about the pieces and the changes they have undergone may be worth adding.

The king seems always to have had the same move as at present; but it is said he could formerly be captured. There seems no recorded proof, however, of his ever having been subject to this liability in the real shatranj. His castling privilege is a European invention; in lieu thereof he formerly leaped two and even three squares, and also to his Kt 2d, which would be a knight's move. Castling dates no further back than the first half of the 16th century. The queen has suffered curious changes in name, sex, and power. In shatranj she was called farz or firz (also farzan, farzin, and farzi), signifying a "counsellor," "minister," or "general." This was Latinized into farzia or ferzia. The French slightly altered the latter form into fierce, fierge, and as some say, vierge, which, if true, might explain her becoming a female. Another and much more probable account has it that whereas a pawn on reaching an eighth square became a farzin, and not formerly any other piece, which promotion was of the same kind as at draughts (in French, *dames*), so she became a dame or queen as in the latter game, and thence dama, donna, &c. There are old Latin manuscripts in which the terms ferzia and regina are used indifferently. The queen formerly moved only one square diagonally, and was consequently the weakest piece on the board. The immense power she now possesses seems to have been conferred upon her so late as about the middle of the 15th century, and there can be little doubt that her investiture therewith arose analogically through the similarity of the powers of promotion possessed alike by the pawns and the common men in draughts. It will be noticed that under the old system the queens could never meet each other, for they operated on diagonals of different colours. The bishop's scope of action was also very limited formerly; he could only move two squares diagonally, and had no power over the intermediate squares, which he could leap over whether they were occupied or not. One result of the peculiar motion of the bishops was that they could never encounter each other even when running on diagonals of the same colour. This limitation of their powers prevailed in Europe until the 15th century. This piece, according to Forbes, was called among the Persians, pil, an elephant, but the Arabs, not having the letter *p* in their alphabet, wrote it fil, or with their definite article al-fil, whence alphilus, alfinus, alfiere, the latter being the word used by the Italians; while the French no doubt get their fol and fou from the same source. The pawns formerly could move only one square at starting; their powers in this respect were increased about the early part of the 16th century. It was customary for them on arriving at an eighth square to be exchanged only for a farzin (queen), and not any other piece; therefore, the plurality of queens is not, as some suppose, a new doctrine. The rooks and knights appear to have always had the same powers as at present. As to the chess boards they were formerly uncoloured, and it is not until the 13th century that we hear of checkered boards being used in Europe.

MODERN HISTORY OF CHESS.—The remarkable, not to say revolutionary, changes which, commencing about the middle of the 15th century, transformed the mediæval shatranj into our modern chess, took place most probably first in France, and thence made their way into Spain.

where the new game was called *Axedrez de la Dama*, being also adopted by the Italians under the name of chess *alla rabiosa*. This revolution of the ancient method of play is contemporaneous with that tide of discovery which set in shortly after the conquest of Constantinople, and culminated in the introduction of typography, the discovery of America, the enunciation of the Copernican theory, &c. The time of the first important writer on modern chess, the Spaniard Ray Lopez de Segura (1561), is also the period when the latest improvement, castling, was introduced, for his book (*Libro de la invencion liberal y arte del juego del Axedrez*), though treating of it as already in use, also gives the old mode of play, which consisted of a solitary leap of the king. Shortly afterwards, the old shatranj disappears altogether, the struggle for existence resulting as usual in the victory of the stronger. Of Lopez it may be said that he was the first who merits the name of chess analyst, as he gives reasons for his different variations in the openings, and for holding different opinions from his predecessor Damiano. At this time flourished the flower of the Spanish and Italian schools of chess—the former represented by Lopez, Ceron, Santa Maria, Busnardo, and Avalos; the latter by Giovanni Leonardo da Catri (il Puttino), and Paolo Boi (il Syracusano). In the years 1562–1575, both Italian masters visited Spain, and defeated their Spanish antagonists, so that this period is rightly considered as that when international chess tournaments first took place. The following century yielded a great number of chess writers, but scarcely any great players; and, in fact, during the whole 17th century, we find but one worthy to be mentioned, viz., the very ingenious Giacchino Groco (il Calabrese), whose recorded games abound in the most beautiful, but often not very sound, combinations. The middle of the 18th century inaugurates a new era in chess, for now the compilations and reprints of very indifferent writers were abandoned by the student and relegated to the collections of bibliophiles. Instead we find real chess-players and painstaking analysts. The leading man of this time was François André Danican Philidor. He was born the 7th of September 1726 at Dreux, near Paris, played chess very early, and was trained by the M. de Kenur Sir de Legal, the then star of the Café de la Régence, which has been the centre of French chess ever since the commencement of the 18th century. In 1747 Philidor visited England, and defeated the Arabian player Phillip Stamma by 8 games to 1 and 1 draw. In 1749 he published in London his *Analyse des Échecs*, a book which went through more editions and was more translated than a score of other works upon the game. In fact it was the chess Koran. During more than half a century Philidor travelled much in England, Holland, and Germany; but unfortunately he never went to Italy, the only country where he could have found opponents of first-rate skill. Italy was represented in Philidor's time by a trio renowned in the history of chess as forming the Modenese school—Ereolo del Rio, Lolli, and Ponziani. The style of these experts was less sound than that of Philidor, but certainly a much finer and, in principle, a better one. It may be added that as an analyst the Frenchman was in many points refuted by Ereolo del Rio, who wrote under the *nom de plume* of the Anonymous Modenese. Blindfold chess play, already exhibited in the 11th century by Arabian and Persian experts, was taken up afresh by Philidor, who played on many occasions three games simultaneously without sight of board or men. These exhibitions were given in London, which he visited every season from 1784 as the guest of the Chess Club in St James's Street; and he died in that city on the 24th of August 1795. As eminent players of this period must be mentioned Count Ph. J. van Zuylen van Nyevelt (1743–

1826), and the German J. Allgaier (1763–1823), after whom is called a well-known brilliant variation of the King's Gambit. Philidor's mantle was taken up by Alexander Louis Honoré Lebreton Deschapelles (1780–1847), who possessed undoubtedly a great genius for the game, and was its champion for many years, notwithstanding that he lacked all knowledge of the theory. The only player who is known to have fought Deschapelles not unsuccessfully on even terms is the veteran John Cochrane. The Frenchman generally declined to play except at odds, and he was ever ready to handicap himself liberally. He lost, however, a match (1821) to W. Lewis, to whom he conceded the pawn and move, the Englishman winning 1 and drawing the 2 others. Deschapelles's greatest pupil, and the strongest player France ever possessed, was Louis Charles Mahé de Labourdonnais—born in 1797—who was the leader of the French school from 1821 until his death in December 1840. His most memorable achievement was his contest with the English champion, Alexander Macdonnell, in a series of matches which resulted in the French player winning in the proportion of 3 to 2 of all the games played.

The English school of chess commenced about the beginning of the present century, and Sarratt was its first leader. He flourished from 1808 to 1821, and was followed by his great pupil W. Lewis, who, however, exhibited his skill in practical play for a short time only, and will be principally remembered for his writings, which stamp him as a great and original chess analyst. His literary career belongs to the period from 1818 to 1848, and he died in 1869. A. Macdonnell has been already mentioned; he was born in 1798 and died in 1836. He was a very ingenious and brilliant player, but lacked soundness. To the same period belongs also Captain Evans, the inventor of the celebrated Evans Gambit (1828), who died at a very advanced age in 1873; Perigal, who participated in the correspondence matches against Edinburgh and Paris; George Walker, for thirty years chess editor of *Bell's Life in London*, who is still alive; and John Cochrane, who has crossed swords with every strong player from Deschapelles downwards, and is still in constant play. In the same period Germany possessed but one player who was above the mediocrities of the time,—J. Mendheim, whose name is connected with Berlin chess, in which city he resided from 1810 to 1836. The fifth decennium of the 19th century is marked by the fact that the chess sceptre departed from the French school, and was grasped by the English. After Labourdonnais's death Fournié de Saint-Amant became the leading player in France; as such he visited England in the early part of 1843, and contended successfully against the best English players, including Howard Staunton; but the latter soon took his revenge, for in November and December 1843 the great match between Staunton and Saint-Amant took place in Paris, the English champion winning by 11 games to 6 with 4 draws. During the succeeding eight years Staunton maintained his reputation by defeating in matches upon even terms Popert, Horwitz, and Harrwitz, besides a number of strong amateurs to whom he conceded large odds. He had also two other matches with Harrwitz, one at pawn and two moves, and the other at pawn and move—the former being won by Staunton, and the latter lost by him. Staunton's services in the cause of chess literature are adverted to below. That they were very great, and that the game in England owes much of its present popularity to him is not to be questioned, as also that for thirty years he occupied a position in the English chess world possessed by none of his contemporaries. Staunton was defeated by Anderssen at the London tournament in 1851, and from that time his match-playing

career concluded. He died suddenly on the 22d of June 1874, at the age of sixty-four. Among the contemporaries of Staunton, mention should certainly not be omitted of Henry Thomas Buckle, author of the *History of Civilization*. His remarkable powers as a chess-player were principally exhibited in games played only for recreation at Simpson's Chess divan, wherein he was successful over Kieseritzki, and used to concede odds to strong players such as Barnes, Bird, &c. He beat Anderssen in 1851—when the Breslau player was at the height of his strength—in a series of 15 well-contested games played between them, by a majority of one game, and he also about the same time defeated Löwenthal in a match.

In the ten years 1830–1840 a new school arose in Berlin, the seven leaders of which have been called the Pleiades. These were Bledow (1795–1846), Bilguer (1815–1840), Hanstein (1810–1850), Mayet (1810–1868), Schorn (1802–1850), B. Horwitz, born in 1809 and now living in London, and last, but not least, the eminent player and chess author, Von Heydebrandt und der Lasa, at present the imperial German ambassador at Copenhagen. As belonging to the same period must be mentioned the three Hungarian players,—Grimm, who died in Turkish Asia, whither he had fled after the insurrection of 1848; Szen, known by his successful combats with Labourdonnais (who conceded the Pesth player pawn and two moves, but lost 11 games out of 12), his competition in the 1851 tourney, as also his general play with the strongest adepts of his time; and J. Löwenthal, lately deceased, whose career, however, belongs more naturally to the period of later British chess. Among other proofs of the skill of these Hungarians is the correspondence match in 1843–45 between Pesth and Paris, won by the former.

The first modern international chess tournament, held at London in 1851, marks the commencement of the present epoch, and was the forerunner of various similar contests between strong players of different nationalities. This tourney brought forward a player who, so far as beauty of combination goes, stands even to the present moment without a rival, viz., A. Anderssen, born in Breslau the 6th of July 1818. Before his appearance in England he had defeated all his German antagonists, and at the above-mentioned tournament he took the first prize, having successively beaten L. Kieseritzki, Szen, Staunton, and Mr Wyvill, M.P. Anderssen played the same year in the tournament of the London Club, and again took first honours. In 1857 he competed in the Manchester tourney, but lost in the last round to Löwenthal, who consequently won the first prize, Anderssen having the second. In December 1858 Anderssen was beaten by Morphy in a match played at Paris, the score being 7 games to 2 and 2 drawn. In 1860 the indefatigable Breslau player again visited Paris, and played successfully against J. Kolisch; and he also defeated the latter in 1861 in a set match played at London by 4 games to 3. In the London tournament of 1862, Anderssen took the first prize; but in 1866 he lost a match to Steinitz, the winner's score being 8 to 6. In 1869 Anderssen came out first in the North German and Rhenish tournaments, and again in 1870 at the Baden-Baden congress; but in the spring of 1871 he lost a match to Zukertort, score 5 to 2, and he took but the third prize at the Vienna congress of 1873. Altogether he has shown himself the most soldier-like of chess players, ever ready for the fight, and never caring to rest upon his reputation. Among those who may be reckoned as more or less owing their training to him are the following eminent players:—D. Harrwitz, J. Dufresne, Max Lange, B. Suhle, P. Hirschfeld, G. R. Neumann, E. Schallopp, S. Mieses, J. H. Zukertort, and many others.

Paul Morphy, who beat Anderssen by such a decisive

majority of games, is considered by many competent judges, and probably with truth, to have been the strongest chess player that ever lived. His career was short but brilliant. Born in New Orleans on the 22d of June 1837, he was taught chess by his father when only ten years of age, and in two years time became a strong player, able to contend with success against his uncle Mr Ernest Morphy and Mr Eugene Rousseau, both high-class experts. When not quite thirteen he played three games with Löwenthal, and won two of them, the other being drawn. He was twenty years of age when he competed in the New York congress of 1857, where he won the first prize, having defeated C. H. Stanley, L. Paulsen, and other strong American amateurs. In 1858 he visited Europe, and there met with a series of triumphs. He arrived first in England, and there defeated by large majorities Boden, Medley, Mongredien, Owen, Bird, and others. He also, in a match played in London, beat Löwenthal by 9 games to 3 and 2 drawn. In September of the same year (1858) he played a match at Paris with Harrwitz, whom he defeated by 5 to 2 and 1 drawn; and later on he obtained a victory over Anderssen as above stated. During his stay in Europe he on two or three occasions played without sight of board or men and simultaneously against eight strong players, each time with great success. He returned to America in May 1859, and here his chess career virtually finishes. He continued to play in his own circle, but with decreasing interest in the game, until 1866, when he totally abandoned its practice and has never played since.

Wilhelm Steinitz, born at Prague in 1836, and for the last fourteen years resident in London, took the sixth prize at the London congress of 1862. Immediately afterwards he defeated Blackburne in a match by 7 to 1 and 2 draws. In 1866 he beat Anderssen in a match by 8 games to 6; and in 1867 he took the third prize at the Paris tournament. In 1868 he carried off the first prize in the British Chess Association handicap, in 1870 the second prize of the Baden-Baden tournament, and in 1872 the first prize of the London grand tourney. In the last-mentioned year he defeated Zukertort in a match by 7 games to 1 and 4 draws. In 1873 he carried off the first prize at the Vienna congress; and in 1876 he defeated Blackburne, winning 7 games right off. He has also won matches against Dubois, Mongredien, Deacon, and Bird, and in 1872–4 he, in conjunction with W. N. Potter, conducted and won a telegraphic correspondence match for London against Vienna.

One of the special characteristics of the present time is the extraordinary power of playing blindfold chess which we now so often see exhibited. In Philidor's age it was considered an almost incredible wonder that he should be able to play three simultaneous games without seeing board or men, but Paulsen, Blackburne, and Zukertort have often played 10 or 12 simultaneous blindfold games, while even as many as 14 and 15 have been so played.

With the following summary of tournaments contested during the last 25 years, the modern history of chess may conclude:—

- 1851. London. 1 Anderssen, 2 Wyvill, 3 Williams, 4 Staunton, 5 Szen, 6 Kennedy, 7 Horwitz, 8 Mucklow.
- 1857. Manchester. 1 Löwenthal, 2 Anderssen.
- New York. 1 Morphy, 2 L. Paulsen.
- 1858. Birmingham. 1 Löwenthal, 2 Falkbeer.
- 1860. Cambridge. 1 Kolisch, 2 Stanley.
- 1861. Bristol. 1 L. Paulsen, 2 Boden.
- 1862. London. 1 Anderssen, 2 L. Paulsen, 3 Owen, 4 G. MacDonnell, 5 S. Dubois, 6 Steinitz.
- 1865. Dublin. 1 Steinitz, 2 MacDonnell.
- 1866. Redcar. 1 De Vere.
- " English Championship Cup. De Vere.
- " British Chess Association. 1 Steinitz, 2 Green.
- 1867. Paris. 1 Kolisch, 2 Winawer, 3 Steinitz, 4 Neumann.

1867. Dundee. 1 Neumann, 2 Steinitz, 3 De Vere and Mac-Donnell.
 1868. English Championship Cup. 1 Blackburne, 2 De Vere.
 1868. British Chess Association Handicap. 1 Steinitz, 2 Wisker, 3 Blackburne.
 1870. Baden-Baden. 1 Andorssen, 2 Steinitz, 3 Blackburne and Neumann.
 " English Championship Cup. 1 Wisker, 2 Burn.
 1870-71. City of London Handicap. 1 Potter, 2 De Vere.
 1871-72. Do. 1 Steinitz, 2 Keats (at odds).
 1872. London. 1 Steinitz, 2 Blackburne, 3 Zukertort.
 " English Championship Cup. 1 Wisker (becoming permanent holder of the Cup), 2 De Vere.
 1873. Vienna. 1 Steinitz, 2 Blackburne, 3 Anderssen, 4 Rosenthal.
 1876. London. 1 Blackburne, 2 Zukertort, 3 Potter.

LITERATURE OF THE GAME. The number of works that have been written upon chess in various languages is very large; and only a few of the principal books on this subject can be cursorily alluded to here. Confining ourselves to those authors who have treated of the practice and science of the game, we may begin with Jacobus de Cessolis, otherwise Jacopo Ducciesole, whose main object, however, though he gives the moves, &c., was to teach morals rather than chess. He was a Dominican friar, and his treatise, *Solatium Ludi Scacchorum, scilicet, Libellus de Moribus Hominum et Officiis Nobilitatis*, was written before the year 1200. It was afterwards translated into French, and in the year 1474 Caxton, under the title of *The Game and Playe of the Chess*, printed an English translation of the French version. It has been held by many that this was the first book printed in England.

In 1490 we have *Die Gottinger Handschrift*, a work containing nine different openings and fifty problems. The author of this manuscript is not known. It is supposed that both he and Laccena were indebted to an earlier source, now unknown. Then comes Vicent, a Spanish writer, whose book bears date 1495. This is pretty well all we know about him, for only the title page has been preserved, the rest of the work having been lost in the first Carlist war, forty years ago. Of Laccena, another Spanish author who wrote in or about 1497, we are better informed. His treatise (*Repeticion des Amores y Arte de Axedres*) comprises various practical chess matters, including 150 positions, illustrated by 160 well executed woodcuts. Various of those positions are identical with those in *Die Gottinger Handschrift*. Damiano's work is an unacknowledged reproduction of Laccena's. In the sixteenth century works upon the game were written by Damiano (as just mentioned), Ruy Lopez, and Horatio Giuntio della Mantia; in the seventeenth century by Salvio, Palerio, Gustavus Selenus, Carrera, Greco, Fr. Antonio, and the authors of the *Traité de Laisance*; in the eighteenth century by Berlin, Stamma, Ercole del Rio, Lolli, Cozio, Philidor, Ponziani, Stein, Van Noyvelt, Allgaier, and Peter Pratt; in the present century by J. F. W. Koch and C. F. Koch, Sarratt, John Cochrane, Wm. Lewis, Silberschmidt, Ghulam Kassim and James Cochrane, George Walker, A. MacDonnell, Jaenisch, Petroff, Van Bilguer, Von der Lasa, Staunton, Kling and Horwitz, Bledow, Dubois, Kieseritzki, Max Lange, Löwenthal, Dufresne, Neumann, Sahlde, Zukertort, Preti, and others. The titles of several recent works by English writers are quoted below.

English chess owes much to W. Lewis and George Walker for their multifarious literary labours in the early part of the present century, the former being the best original analyst that England has yet produced. But to Howard Staunton must be ascribed the most important share in creating the popularity which the game has achieved in this country. His victory over St. Amant in 1843, and his successful career as a match player during the ensuing eight years, tended in the first place to attract the popular attention, while his works gave a style and a shape to the practice of the game amongst his countrymen such as contributed much towards laying the basis of that high degree of excellence which now characterises chess playing in England. Staunton's first work, the *Chess Player's Handbook*, was published in 1847, and again (revised) in 1848. For want of further adequate revision many of its variations are now out of date, while later additions and discoveries naturally find no place therein; but taking the *Handbook* as it was when issued, very high praise must be bestowed upon the author for the good judgment, ability, and painstaking labour evidenced in the compilation of the work. If there be anything wanting in original analysis, this is more than compensated for by the rare, keenness, learning, and research which enabled him to utilize and condense in a clear, intelligible, and attractive form all the stores of knowledge then accessible. His other works are the *Chess Player's Text Book* and *The Chess Player's Companion* (1849), the latter being a collection of his own games, the *Chess Praxis* (1860), and various smaller treatises. As has been already stated, the laws of the game, as laid down in the *Praxis*, form the basis of the rules adopted by the British Chess Association in 1862, the main differences between the two codes arising from a mitigation in the Association laws of some of the

severe penalties laid down in the *Praxis*, and the enactment of the "Dummy Pawn" rule, whereby a pawn on reaching an eighth square may, if the player chooses, remain a pawn. In 1840 Staunton established the *Chess Player's Chronicle*, which periodical he continued to edit until 1856, while for four years—commencing in 1865—he carried on the *Chess World*. Moreover, he was the chess editor of the *Illustrated London News* during a period of thirty years, viz., from 1844 till his death in 1874. The services which he rendered to chess in thus popularizing the game and successfully engraving it upon our periodical literature have been admitted in all quarters. In this respect also George Walker's work in *Bell's Life in London*, of which publication he was the chess editor for forty years, should not go without special acknowledgment. To Staunton's works must now be added his posthumous *Chess Theory and Practice*, edited and prepared for the press by R. B. Wernald, 1876.

Among Continental chess authorities Von Heydebrandt und der Lasa (more usually known by his second title) stands pre-eminent. The German *Handbuch*, the famous volume with which his name is inseparably associated, was commenced in 1843 by Von Bilguer, who died before the first edition was completed. The second, third, fourth, and fifth editions (the last published in 1874) were successively edited and revised by Von der Lasa, and the book now stands a lasting monument of his genius and industry.

Of recent English works upon the openings the following may be mentioned:—*The Book of Chess*, by G. H. Selkirk, 1868; *Key to the Chess Openings*, by Thomas Long, 1871; *Positions in the Chess Openings*, by the same author, 1874; *Chess Openings*, by F. W. Longman, 1874; *Synopsis of the Chess Openings*, by Wm. Cook, 1874; *The Chess Player's Manual*, by G. H. D. Gossip, 1875; and *The Chess Openings*, by Robert B. Wernald, 1875. There has also lately appeared a selection of games, compiled by H. E. Bird, under the title of *Chess Masterpieces*, 1875; and likewise the following collections of problems, viz., *Chess Problems*, by J. Pierce, M.A., and W. T. Pierce, 1873; *Supplement to Chess Problems*, by the same authors, 1874; and *English Chess Problems*, a selection of chess problems by the best English composers living and lately deceased, also put forth by the brothers Pierce, 1876.

| 2. B takes Kt (ch) &c. | |

(W. N. P.)

CHESTER, an ancient city of England in West Cheshire, the capital of the county, situated on the river Dee, 20 miles from the open sea, 16 miles S.E. of Liverpool, and 179 miles N.W. of London by rail. The city is divided into four principal blocks by the four principal streets—Northgate Street, Eastgate Street, Bridge Street, and Watergate Street, which radiate at right angles from the Cross, and terminate in the four gates. These four streets exhibit in what are called "the Rows" a characteristic feature of the city. Their origin is a mystery, and has given rise to much controversy and speculation. In Eastgate Street, Bridge Street, and Watergate Street, the Rows exist on each side of the street throughout the greater part of their length, and may be described as continuous galleries open to the street, over and under which the houses lining the streets project, and which are formed as it were out of the front first-floor of the houses, approached by flights of steps from the roadway. The Rows are flagged or boarded under foot and ceiled above, thus forming a covered way, standing

gates. The Grosvenor Bridge, a single span of stone 205 feet in length, the largest, save one over the Danube, it is believed, in Europe, carries the road to Wrexham and Shrewsbury over the Dee on the south-west, while the old bridge of seven arches is interesting on account of its antiquity and picturesque appearance. The city possesses but few public buildings besides the cathedral and the churches. The castle, with the exception of "Caesar's Tower," and a round tower with adjacent buildings in the upper ward, was taken down towards the end of the last century, and replaced by a gateway, a barracks, a county hall, a jail, and assize courts,—all buildings of pure classic architecture after the design of Thomas Harrison, a local architect, who was also the architect of the Grosvenor Bridge. In Northgate Street stands the town hall, a handsome stone building of Continental-Gothic design, which replaced the old Exchange, burnt down in 1862. The market-place, a little to the south of it, was opened to the public in 1863. Near the north-west angle of the city walls is the infirmary, founded in 1761, capable of holding 100 beds, and furnished with a fever ward in a detached building to the east of it. The savings-bank is a pretty Gothic structure in Grosvenor Street, erected in 1853. The Grosvenor Hotel, rebuilt by its owner, the late marquis of Westminster, is a handsome building near the east gate, the upper stories being timbered in accordance with the style of the old houses in the city. Besides these may be mentioned the general post-office, designed after the Elizabethan style, the custom-house, the free library, the music hall, and the training college. Among the most interesting of the ancient houses are Derby House, bearing the date 1591, Bishop Lloyd's House, and God's Providence House in Watergate Street, and the Bear and Billet in Lower Bridge Street; the three last bear dates in the 17th century. The Natural Science Society, founded by Canon Kingsley, and the Archaeological Society have their lecture-rooms and museums at the Old Albion in Lower Bridge Street.

Besides the Benedictine Abbey of St Werburgh, the Franciscans, the Dominicans, and the Carmelites had houses in Chester, and the sites of the first and last are still commemorated in the names of Grey Friars and White Friars; St John's, without the walls, was a collegiate church, with a dean, seven prebendaries, and four vicars. Chester was for a time in the diocese of Lichfield and Coventry, but in 1075, Peter, then bishop, restored the seat of the see to Chester, and made St John's his cathedral; his successor, however, removed the seat back to Coventry, and in 1541 Henry VIII. erected Chester into an independent see, and the abbey church of St Werburgh into the cathedral of the diocese. He richly endowed the cathedral, and constituted in it a dean and six prebendaries, now reduced to four, who are styled canons. The King's School for public education was founded by the same patron, and in it the king provided that 24 poor scholars should be taught free of charge. The school has now, however, been remodelled, and placed under a board of governors by the Endowed Schools Commissioners. Within the walls are the parish churches of St Oswald, founded about 1093; St Peter, founded before the Conquest; St Michael, probably founded before 1118; St Bridget, founded prior to 1224; the Holy and Undivided Trinity, founded in or before the 12th century; St Mary,

Plan of Chester.

in the same relation to the shops, which are at their back, as the foot pavement does in other towns. In Northgate Street, on the other hand, the Row on the west side is formed as it were out of the ground floor of the houses, having cellars beneath, while on the east side the Row is formed at the same elevation as in the other three principal streets. In these streets are several examples of the old timbered houses of the 17th century, and some good specimens of modern imitations of them,—all combining to give a picturesque and foreign character to the town. There is also a chamber with stone groined roof of the 14th century in the basement of a house in Eastgate Street, and another of a similar character in Watergate Street. A mortuary chapel of the early part of the 13th century exists in the basement of a house in Bridge Street.

Chester is the only city in England that still possesses its walls perfect in their entire circuit of two miles. The gateways have all been rebuilt within the last hundred years,—the north and east gates on the site of the Roman

City Arms.

Arms of Bishopric.

founded probably in the 12th century; St Martin, founded prior to 1250; and St Olave, founded prior to the 12th century. The two last-named parishes are amalgamated with St Bridget and St Michael respectively. In the suburbs are St John's, St Paul in Boughton, Christ Church in Newton, All Saints in Hoole, and St Thomas. Among the Nonconformist places of worship, which represent all the principal denominations, may be mentioned the Unitarian Chapel in Crook Lane, built originally by the followers of Matthew Henry, one of the ejected ministers. For the recreation of the inhabitants provision is made by the New Grosvenor Park, presented to the town in 1867 by the marquis of Westminster, and the Roodee, a level tract at the base of the city walls appropriated as a race course.

The original charter which the city received from Earl Ranulph was confirmed, and the privileges extended, by many subsequent charters granted by different sovereigns and princes. Of these the most important were that of Edward I., which granted the office of coroner, defined and extended the jurisdiction of the courts of civil and criminal jurisdiction, and granted freedom from toll, &c., to the citizens throughout his dominions; that of Edward, the Black Prince, which defined and particularized the boundaries of the city, giving it a circuit of 12 or 14 miles, and granted jurisdiction of the river Dee to the mayor and citizens from a spot then and still called "Iron Bridge" above the city, to a point near Hoylake at the mouth of the river; and lastly, the charter of Henry VII., which ordained that the corporation should consist of a mayor, 24 aldermen, and 40 common councillors, to be elected annually, created the office of recorder, regulated and gave exclusive jurisdiction to the mayor's and sheriff's courts, empowered the mayor to have his sword of state carried (in the absence of the king and his heirs) before all others with point upwards, and finally erected the city into a county by itself with a separate commission of the peace. The corporation thus constituted continued till the passing of the Municipal Corporations Act, under which the government of the city is now vested in the mayor, 10 aldermen, and 30 councillors. The recorder is now a barrister appointed by the Crown. He is the judge of the local courts, called the Portmote (originally the mayor's court), the Pentice (originally held before the two sheriffs in a building now pulled down, called the Pentice), and the Passage Courts now fallen into disuse. He also presides at the city court of quarter sessions, which now alone retains a limited criminal jurisdiction, which once the city courts possessed even to the infliction of capital punishment.

The population of the municipal (as distinguished from the parliamentary) borough was, according to the census of 1861, 31,110, and in 1871, 35,257 (16,910 males and 18,347 females). The area of the municipal borough is 3437 acres, and that of the parliamentary, which includes parts of Hoole, Saltney, Great Boughton, and Newtown, 3455 acres, containing a population in 1871 of 38,390, and returning two members to parliament. The trade of the town is nominally represented by 23 guilds. Within the walls there is no extensive manufacture carried on, save that of shoes and boots for exportation and the wholesale home trade, and furniture and upholstery. In the suburbs shot and white and sheet lead are very largely manufactured, and flour of superior quality is produced. There are also several iron foundries, and the more humble manufacture of pipe-making has been carried on from a remote period. As a port there can be little doubt that Chester was at one time of importance, but the silting up of the channel of the Dee affected its commerce injuriously as early as the 15th century, and now the shipping trade is inconsiderable.

The history of Chester reaches back to very early times. Higden ascribes the foundation of the town to a very remote period; but

the Welsh name by which it was even in Higden's day and is still known—*Caerlleon Vawr* or *Caerlleon ar Dydyrlyw*, which means the "great camp or station of the legion on Dee,"—points to a Roman origin. It is the *Dera* of the Roman Itineraries, and from its position at the head of the then most important estuary on this part of the coast, and at a point where several Roman roads converged, it must soon have risen in prosperity and importance. The dignity of a Roman *colonia* has been claimed for it by some writers, but there is no certain evidence on which such a claim can be grounded. The pick and spade, however, have revealed numerous proofs that it was "no mean city." Among numerous altars from time to time examined is one of rare occurrence with a Greek inscription, and dedicated by Hermogenes, a physician. Of the latest discoveries the most remarkable was made in pulling down the Feathers Hotel on the east side of Bridge Street, when the remains of a fine basilica were brought to light, having a row of seven Corinthian pillars on either side once supporting its roof, and a series of apartments on its south side,—probably in connection with baths,—floored with tessellated and herring-bone tile pavements, and warmed by an extensive hypocaust, a portion of which is still to be seen underneath some adjoining houses.

The town was walled, and in form was rectangular and equilateral or nearly so, but was not co-extensive with the present city. The four principal streets followed generally the line of the present streets running north and south and east and west, crossing each other in the centre of the town. The southern wall of the town, running from a point near the distance chair in the race-course, past St Bridget's rectory eastwards, cut across the present city, about the top of Lower Bridge Street, just below St Michael's Church, and joined the wall on the eastern side somewhere a little to the north of what are now called "The Wishing Steps," and there was probably a tower at each angle of the wall. A Roman arch, however, still existing and impinging upon the Keep or "Caesar's" Tower in the Castle, and also another arch (now removed), incorporated into the walls near the old bridge, and called "The Ship Gate," attest the existence of some outwork overhanging the river for the protection probably of the trajectory by which the Roman roads to the south and west, emerging from the town by the southern gate, crossed at a point just below. The renowned XXth Legion was stationed here from an early period of the Roman occupation to as late as the third century.

After the departure of the Romans, Chester appears to have been possessed in turn by Britons, Saxons, and Danes; in 894 it was found a deserted city by the Danes, who then took possession, and were in turn starved out by a besieging Saxon army. Earl Ethelred restored it in 903, extending its walls so as to embrace the castle. After the defeat of the Danes by Edmund in 942, Chester for a time enjoyed comparative repose. Athelstan revived its mint; Edgar received homage of his vassals there; and Harold's queen found a home there after the battle of Hastings. Mercia had up to this time been governed by its earl. Beyond Chester lay the still hostile Welsh, for the reduction of whom the place afforded an important basis of operations, this led to the establishment after the Conquest of the Norman earldom of Chester, which was first granted to Gherbod, a noble Fleming. After him Hugh Lupus, the nephew of the Conqueror, was invested as earl of Chester, with sovereign or palatinate authority over the tract of country now represented by the county of Cheshire, and the coast-line of Flintshire, as far as Rhuddlan, with Chester as the seat of his Government. In the castle, built, or at least reconstructed by Earl Hugh, the earl assembled his court or council; and here too sat the exchequer and other courts. Earl Hugh was the founder of the Benedictine Abbey of St Werburgh, which he richly endowed. It was during the rule of these Norman earls that Chester received at the hands of Earl Ranulph I. its first charter, and took rank as a city, but the language of this charter indicates that Chester already possessed some municipal privileges. Under this charter were established local courts of civil and criminal jurisdiction, which were the germs of the Portmote, Pentice, and Passage Courts. On the death of Earl John in 1237, Henry III. seized the earldom and it has ever since been an appanage of the Crown. The county, however, retained its palatinate character, and Chester still continued to be the seat of its jurisdiction. Though no longer the metropolis of an almost independent dominion, Chester still, as the capital of the palatinate and the key to North Wales, yet unsubdued, ranked high among the cities of the west of England, was often honoured by royal visits, and was the object of attack and defence during the many civil wars. In 1256 she narrowly escaped the fury of Llewelyn, who, we are told, carried fire and sword to her very gates. Edward I. visited the city on several occasions; in 1276 he summoned Llewelyn to do him homage here, and the next year he marched through with a powerful army to Rhuddlan. In 1300 his son Edward, the first English Prince of Wales, here received the final submission of the Welsh to the sovereignty of England. Hither Henry of Lancaster led his captive sovereign, Richard II., from Flint Castle, and imprisoned him in a tower over the outer gateway of the Castle. In 1459 queen Margaret

visited the city, and Henry the VII., accompanied by his queen and mother in 1494. In 1507, 1517, and 1550, Chester shared with other places the visitation of the sweating sickness, which carried off many of its inhabitants. It was also severely scourged by the plague, 1602 to 1605, that the city fairs were suspended, and the court of exchequer removed to Tarvin, and the assizes to Nantwich. In 1647-48 this epidemic for the last time raged with a terrible fatality; from June 22 to April 20 it is said that 2099 persons perished of the plague in the several city parishes. But of all the events in the history of Chester, there is none so memorable as the protracted siege which the city endured in its loyalty to Charles I. The king, having hoisted his standard at Nottingham, arrived at Chester in the autumn of 1642, where he was enthusiastically received. The sacrifices made by the citizens for the royal cause were great. In 1644, the pecuniary levies upon them amounted to as much as £200 every fortnight. The siege began in July 1643, and in the autumn of 1645 the assailants, despairing of taking it by assault, converted the siege into a blockade. In 1646-7 the citizens were in such extremities as to be in want of the commonest necessaries of life. It was only after a tenth summons that, on February 3, 1646, they at last agreed to the articles of surrender, by which the garrison were allowed to march out with all the honours of war, the safety of the persons and property of the citizens with liberty to trade was secured, and the sanctity of the sacred edifices and their title deeds preserved. In 1659 Sir George Booth and a large party of the citizens seized the garrison for Charles II., then still an exile, but they were afterwards repulsed in an action fought near Winnington bridge, by Lambert, the Parliamentary general. In 1660 the joy felt by the citizens at the Restoration, was expressed by the magnificent reception accorded to the learned Dr Brian Walton, the new bishop of Chester, on his coming to take possession of his see. The spirit of the inhabitants evinced, however, a change in 1683, when the presence of the duke of Monmouth was the cause of a tumultuous mob, who, after committing other acts of violence, forced the cathedral doors, destroyed most of the painted glass, demolished the font, and did other damage there. James II. visited the city in 1687, and his successor, William III., in 1690. Coming to more modern times, the city accorded a hearty and brilliant welcome to the Prince of Wales on the 14th October 1869, when he honoured them with his presence to open the new Town Hall. (W. W. F.)

CHESTER, a city of the United States, in the county of Delaware, Pennsylvania, on the right bank of the Delaware River, 10 miles south-west of Philadelphia by the railway to Wilmington. It has five or six churches, two high schools, and a national hall, and carries on the manufacture of cotton and woollen goods, machinery, and carriages. Founded by the Swedes in 1643 under the name of Upland, it ranks as the oldest town in the State, and was the seat of the provisional assembly held by Penn in 1682. From that date till the formation of Delaware county in 1789, it was the chief town of the county of Chester,—a position now held by the city of West Chester. Population in 1850, 1667; and in 1870, 9485.

CHESTERFIELD, a municipal borough and market-town of England, in East Derbyshire, 12 miles south of Sheffield by the Midland Railway. It is situated on the Rother and Hipper, and is the terminus of a canal extending a distance of 46 miles to the Trent at Stockwith. It is irregularly built, with narrow streets, but has a spacious market-place. The church of All-Saints is a large and elegant edifice of the 13th century, with a remarkable twisted spire 230 feet high, which has given rise to considerable discussion as to whether it was so constructed or owes its deformity to the warping of the woodwork. There are eight or nine dissenting churches, a free grammar school, founded by Queen Elizabeth, and rebuilt in 1710 and 1845, a girls' industrial school established in 1819, and various other educational institutions, a municipal hall erected in 1849, a market-hall (which dates from 1855-7 and contains a corn-exchange), a town-library, a mechanics' institute, a prison, assembly rooms, a hospital, a theatre, and an institute of mining, civil, and mechanical engineers. The manufactures include cotton, silk, earthenware, machinery, and tobacco; and there are coal, iron, and lead mines in the vicinity. Races are held on Whittington Common, about a mile from the town, in the neighbourhood of the famous Revolution House. The

population of the municipal borough in 1861 was 9836, and in 1871 it was 11,427. Chesterfield was a Roman station on the road from Derby to York, and its name is partly of Roman origin. At the time of the Conquest it was of but little importance, but in the reign of King John it received a charter of incorporation. In the year 1266 the rebellious barons were defeated in the neighbourhood by Henry, the nephew of Henry III. In 1642 the town was occupied by the forces of Sir John Gell, and in 1643 by Sir Thomas Fairfax.

CHESTERFIELD, PHILIP DORMER STANHOPE, FOURTH EARL OF (1694-1773), the son of Philip Stanhope, the third earl, and Elizabeth Savile, daughter of the marquis of Halifax, was born in London. Deprived at an early age of his mother, the care of the little Lord Stanhope devolved upon his grandmother, the marchioness of Halifax, a lady of culture and connection, whose house was frequented by the most distinguished Whigs of the epoch. He soon began to prove himself possessed of that systematic spirit of conduct and effort which appeared so much in his life and character. Divined by Ruigny, earl of Galway, who perceived in him a nascent aptitude for pleasure and politics overlaid with a strong natural tendency to indolence, he was advised by that nobleman, if he would become a man of mark, to rise early; he acquired the habit, and kept it. His education, commenced under a private tutor, was continued (1712) at Trinity Hall, Cambridge; here he seems to have read hard, and to have acquired a considerable knowledge of ancient and modern languages. The great orators of all times were a special object of study with him, and he describes his boyish pedantry pleasantly enough, but by no means without a touch of self-satisfaction in the memory. His university training was supplemented (1714) by a Continental tour, untrammelled by a governor; at the Hague his ambition for the applause awarded to adventure made a gamester of him, and at Paris he began, from the same motive, that worship of the conventional Venus, the serious inculcation of which has earned for him the largest and most unenviable part of his reputation.

The death of Anne and the accession of George I. opened up a career for him and brought him back to England. His relative James Stanhope, the king's favourite minister, procured for him the place of gentleman of the bedchamber to the Prince of Wales. In 1715 he entered the House of Commons as member for St Germans, and when the impeachment of James, duke of Ormond (June 21, 1715), came before the House, he used the occasion to put to proof his old rhetorical studies. His maiden speech was youthfully fluent and dogmatic; but on its conclusion the orator was reminded, with many compliments, by an honourable member, that he wanted six weeks of his majority, and consequently that he was amenable to a heavy fine for speaking in the House. Lord Stanhope quitted the Commons with a low bow, and started for the Continent. From Paris he rendered the Government important service by gathering and transmitting information respecting the Jacobite plot; and in 1716 he returned to England, resumed his seat, and took frequent part in the debates. In that year came the quarrel between the king and the heir apparent. Stanhope, whose political instinct obliged him to worship the rising rather than the setting sun, remained faithful to the prince, although the ministry made several attempts to win him over. In 1723 a vote for the Government got him the place of captain of the yeomen of the guard; his happy reply to his predecessor, Lord Townshend, is a fine example of *spirituel* urbanity, and is valuable as indicating, among other examples, his contempt for the money-jobbing system that obtained at court. In 1725, on the revival of the Bath, the red riband was offered to him, but was declined.

In 1726 his father died, and Lord Stanhope became earl of Chesterfield. He took his seat in the Upper House, and his oratory, never effective in the Commons by reason of its want of force and excess of finish, at once became a power. In 1727, on the accession of George II., Chesterfield was sent to the Hague as ambassador. In this place his tact and temper, his doctorty and discrimination, enabled him to do good service, and he was rewarded with Walpole's friendship, a Garter, and the place of Lord High Steward. In 1732 there was born to him, by a certain Madame du Bouehet, the son, Philip Stanhope, for whose advice and instruction were afterwards written the famous *Letters*. In the same year, being somewhat broken in health and fortune by his sojourn abroad, he resigned his embassy and returned to England. A few months' rest enabled him to resume his seat in the Lords, of which he was one of the acknowledged leaders. He supported the ministry, but his allegiance was not the blind fealty Walpole exacted of his followers. The Excise Bill, the great premier's favourite measure, was vehemently opposed by him in the Lords, and by his three brothers in the Commons. Walpole bent before the storm, and abandoned the measure; but Chesterfield was summarily dismissed from his Stewardship. For the next two years he led the opposition in the Upper House, leaving no stone unturned to effect the downfall of the man who had wronged him. In 1742 Walpole fell, and Carteret reigned in his stead. The new ministry, however, had not Chesterfield either in its ranks or among its supporters. He remained in opposition, distinguishing himself by the courtly bitterness of his attacks on George II., who learned to hate him violently. In 1744 the king was compelled to abandon Carteret, and the coalition or "Broad Bottom" party, led by Chesterfield and Pitt, came into office. In the troublous state of European politics the earl's conduct and experience were more useful abroad than at home, and he was sent to the Hague as ambassador a second time. The success of his mission was complete; and on his return a few weeks afterwards he received the lord-lieutenancy of Ireland, a place he had long coveted.

Short as it was, Chesterfield's Irish administration was of great service to his country, and is unquestionably that part of his political life which does him most honour. To have conceived and carried out a policy which, with certain reservations, Burke himself might have originated and owned is indeed no small title to regard. The earl showed himself finely capable in practice as in theory, vigorous and tolerant, a man to be feared, and a leader to be followed; he took the government entirely into his own hands, repressed the jobbery traditional to the office, established schools and manufactures, and at once conciliated and kept in check the Orange and Popish factions. In 1746, however, he had to exchange the lord-lieutenancy for the place of Secretary of State. With a curious respect for those theories his familiarity with the secret social history of France had caused him to entertain, he hoped and attempted to retain a hold over the king through the influence of Lady Yarmouth, though the futility of such means had already been demonstrated to him by his relations with Queen Caroline's "*ma bonne Howard*." The influence of Newcastle and Sandwich, however, was too strong for him; he was thwarted and over-reached; and in 1748, he resigned the seals, and returned to cards and his books with the admirable composure which was one of his most striking characteristics.

The dukedom offered him by George II., whose ill-will his fine tact had overcome, was refused. He continued for some years to attend the Upper House, and to take part in its proceedings. In 1751, seconded by Lord Macclesfield, President of the Royal Society, and Bradley,

the eminent mathematician, he distinguished himself greatly in the debates on the calendar, and succeeded in making the new style a fact. Deafness, however, was gradually affecting him, and he withdrew little by little from society and the practice of politics. In 1754 occurred the famous dispute with Johnson over the dedication to the *English Dictionary*. This quarrel (to which are owing the doctor's noble letter and some half dozen of his roughest *mots*, and the earl's clever portrait of the "intelligent Hottentot"), with the neglect it assumed on Chesterfield's part, has been fatal to his reputation as a man of heart. During the twenty years of life that followed this episode, Chesterfield wrote and read a great deal, but went little into society. In 1768 died Philip Stanhope, the child of so many hopes; and the earl, who had no children by his wife, Melusina von Schulenberg, illegitimate daughter of George I., whom he married in 1733, adopted his godson the heir to the title and estates. His famous jest (which even Johnson allowed to have merit),—"Tyranny and I have been dead these two years, but we don't choose to have it known"—is the best description possible of his humour and condition during the latter part of this period of decline. To the deafness was added blindness, but his memory and his fine manners only left him with life; his last words ("Give Dayrolles a chair") prove that he had neither forgotten his friend nor the way to receive him. He died on the 24th of March 1773.

Chesterfield was selfish, calculating, and contemptuous; he was not naturally generous, and he practised dissimulation till it became part of his nature. In spite of his brilliant talents, and of the admirable training he received, his life, on the whole, cannot be pronounced a success. His anxiety and the pains he took to become an orator have been already noticed, and Horace Walpole, who had heard all the great orators, preferred a speech of Chesterfield's to any other; yet the earl's eloquence is not to be compared with that of Pitt. Samuel Johnson, who was not perhaps the best judge in the world, pronounced his manners to have been "exquisitely elegant;" yet as a courtier he was utterly worsted by Robert Walpole, whose manners wore anything but refined, and even by Newcastle. He desired to be known as a protector of letters and literary men; and his want of heart or head over the *Dictionary* dedication, though explained and excused by Croker, none the less inspired the famous change in a famous line—"Toil, envy, want, *the patron*, or the jail." His published writings have had with posterity a very indifferent success; his literary reputation rests on a volume of letters never designed to appear in print. The son for whom he worked so hard and thought so deeply failed especially where his father had most desired he should succeed, becoming, not a fine gentleman, but a commonplace book-worm. As a politician and statesman, Chesterfield's fame rests on his short but brilliant administration of Ireland. As an author he stands or falls by the *Letters to his Son*, first published by Stanhope's widow in 1774. The *Letters* are brilliantly written,—full of elegant wisdom, of keen wit, of admirable portrait-painting, of exquisite observation and deduction. Against the charge of an undue insistence on the external graces of manner Chesterfield has been adequately defended by Lord Stanhope (*History*, iii. 34). Against the often iterated accusation of immorality, it should be remembered that the *Letters* reflected the morality of the age, and that their author only systematized and reduced to writing the principles of conduct by which, deliberately or unconsciously, the best and the worst of his contemporaries were governed.

See Chesterfield's *Miscellaneous Works*, London, 1777-8, 2 vols. 4to; and *Letters to his Son* (edited by Lord Mahon), London, 1845-51, 5 vols. See also Lord Mahon (Stanhope), *History of England from the Peace of Utrecht to the Peace of Versailles*.

CHESTER-LE-STREET, a market-town of England in the county of Durham, near the River Wear, six miles north of Durham, on the North-Eastern Railway. The principal building is the parish church of St Mary and St Cuthbert, an interesting old Gothic structure, restored in 1862, with a tower 156 feet in height. There is a union workhouse at the south end of the town, which consists of two long parallel streets. Chester-le-Street is a place of considerable antiquity; under the name of *Cuneceastre*, it was made the see of a bishop in 882, and continued to be the head of the diocese till the Danish invasion of 995. During that time the church was the repository of the shrine of St Cuthbert, which was then removed to Durham. About a mile along the river is Lumley Castle, the seat of the earl of Scarborough, and about two miles to the northward lies Lambton Castle, the residence of the earl of Durham, built in 1797 on the site of the old House of Harraton. The iron manufacture is prosecuted to a considerable extent, and about 4000 persons are employed in the coal mines of the neighbourhood. In 1871 the population of the town was 2450, and of the township, 4205.

CHESTNUT. The Spanish or Sweet Chestnut, *Castanea vesca* (natural order, *Corylaceæ*), is a stately and magnificent tree, native of the countries bordering on the Mediterranean, but also ripening its fruit in sheltered situations as far north as Scotland. It lives very long, attains a large size, spreading its branches widely, and it has large lanceolate serrate leaves, long pendulous male catkins, with fewer inconspicuous female flowers, the fruit being an echinate capsule, containing from two to five nuts, of which seldom more than three are mature. The largest known chestnut tree is the famous *Castagno di cento cavalli*, or the chestnut of a hundred horses, on the slopes of Mount Etna, a tree which when measured nearly a hundred years ago, by Count Borch, was found to have a circumference of 190 feet. By many observers it has been maintained that this colossal tree consisted of a fusion of several trunks; but many specimens not much smaller exist in the neighbourhood, and by digging around it has been found that all the trunks end in one root. The wood of the sweet chestnut is valued by cabinet-makers and coopers; and among European timbers it was at one time esteemed second to the oak, which it so closely resembles that in old wood-work the two timbers are very difficult to distinguish. Chestnuts (the fruit of the tree) are extensively imported into Great Britain, and roasted are much eaten as a delicacy. In a raw state they have a sweet taste, but are difficult of digestion. The trees are very abundant in the south of Europe, and chestnuts bulk largely in the food resources of the poor in Spain, Italy, Switzerland, and Germany. In Italy the kernels are ground into meal, and used for thickening soups, and even for bread-making. In North America, the fruits of an allied species, *C. americana*, are similarly eaten.

The Horse Chestnut, *Æsculus Hippocastanum*, is in no way allied to the sweet chestnut except in name. It is a strikingly beautiful tree, especially in spring, with its large digitate leaves, and conspicuous spikes of white flowers. A useful starch may be extracted from its kernels, but this has not hitherto been practised on an economic basis. The entire tree must be regarded as more ornamental than useful.

CHEVIOT HILLS, a range extending a distance of about 35 miles along the confines of England and Scotland, mainly situated in Northumberland, but partly also in Roxburgh. The western portion consists principally of carboniferous strata, while the eastern is chiefly composed of igneous rocks. They attain their greatest height, of 2684 feet, in Cheviot Peak, which lies eight miles south-

west of Wooler, in Northumberland; and next in elevation is Carter Fell, which slightly exceeds 2000 feet. The range is now chiefly famous for a valuable breed of sheep, which find abundant pasture on its smooth declivities; but in earlier days it was the scene of many an episode of border warfare, and its name is inseparably associated with the ballad of *Chevy Chase*.

CHÉZY, ANTOINE LÉONARD (1773–1832), a French orientalist, was born at Neuilly in 1773. He was intended by his father for the profession of engineering; but his taste was for philology; and in 1790 he sought and obtained a post in the Oriental department of the national library. About 1803 he commenced the study of Sanskrit, though he possessed neither grammar nor dictionary, and, by means of great labour, he obtained so complete a knowledge of the language that he composed in it verses which are said to possess great elegance. He had besides a considerable acquaintance with other Eastern languages; and his attainments place him in a high rank among Orientalists. His merits were recognized by his appointment to the chair of Sanskrit in the Collège de France, in 1803, and to the dignity of chevalier of the legion of honour.

Among other works he left—*Extrait du livre des Merveilles de la Nature, par Mohammed*; *Medjoun et Léila*, from the Persian; *Yadjanadatta Badhu*, and *Sakountala*, from the Sanskrit; *L'Anthologie érotique d'Amrou*; *Grammaire sanscrite*; *Vocabulaire sanscrit, prâcrit, et français*; *Chrestomathie persanne*; *Chrestomathie sanscrite*.

CHHATISGARH, a division or commissionership of British India, under the jurisdiction of the chief-commissioner of the Central Provinces, comprising the districts of Raipur, Bilaspur, and Sambalpur, and seven small feudatory states, between 16° 50' and 23° 10' N. lat., and between 80° 30' and 83° 15' E. long. It is bounded on the N. by Sohagpur in the Rewah state and by the Sirgúj and Udaipur states of Chutiá Nágpur; on the E. by the Orissa tributary states and the northern districts of Madras; on the S. by the Bastar state of the Central Provinces; and on the W. by the districts of Chándá, Bhándará, Bálághát, Seoni, and Mandlā. The area is 39,647 square miles; the population in 1872 was 3,289,043, residing in 16,054 villages or townships, and in 726,190 houses. Classified according to religion there are 2,054,874 Hindus, or 62.48 per cent.; 26,046 Muhammadans; 243 Buddhists and Jains; 451 Christians; and of aboriginal tribes and persons of unspecified religion, 1,207,429, or 36.72 per cent. Two great rivers, the Nerbudda and Son, take their rise at the side of the Amarkantak hill in the north-west corner of the division, the former flowing nearly due west to the Bombay coast, the latter ultimately falling into the Ganges in Lower Bengal.

CHHINDWARÁ, a district of British India, in the Nerbudda division of the Central Provinces, situated between 21° 25' and 22° 50' N. lat., and between 78° 0' and 79° 30' E. long. It is bounded on the N. by the districts of Hoshangabad and Narsinhpur, on the E. by Seoni, on the S. by Nágpur, and on the W. by Betul, and contains an area of 3852 square miles. The district has two distinct natural subdivisions—the hill country above the slopes of the Sâtpurá Mountains, called the Bálághát, and a tract of low land to the south called the Zerghát. The high tableland of the Bálághát lies for the most part upon the great basaltic formation which stretches across the Sâtpurá as far east as Jabalpur. The country consists of a regular succession of hills and fertile valleys, formed by the small ranges which cross its surface east and west. The average height of the uplands is 2500 feet, but there are many points of greater elevation. The appearance of the Zerghát below the hills is generally open and undulating. The

country is intersected by several streams, of which the Kanhan is the most considerable. Near the hills and along the streams are strips and patches of jungle; the villages are usually surrounded with picturesque groves of tamarind, mango, and other shade-giving trees. The total population of the district, as ascertained by the census of 1872, is 159,116 males and 156,979 females; total 316,095, classified as follows:—Hindus, 191,669; Muhammadans, 9747; Buddhists and Jains, 574; Christians, 105; "other denominations," consisting of aboriginal tribes, 114,000. The average density of the population is 80·72 per square mile. Three towns are returned as containing a population of upwards of 5000, viz.: Chhindwara, the administrative head-quarters of the district, population 8626; Lodhikera, population 5219; and Pandhurna, population 5218. Important discoveries of coal have been made here of late years; it is estimated that the area under which coal lies is over 250 square miles, some of the seams being as much as 18 feet in thickness. The forests of Chhindwara are very extensive, and lie principally on the southern slopes of the Satpuras. The total revenue of the district in 1873-74 amounted to £31,513, of which £21,687, or 68·8 per cent., was derived from the land-tax. For the protection of person and property, and administration of justice, the district contains 6 magisterial and 5 civil and revenue courts, together with a regular police of 361 men of all ranks, maintained at a cost of £5037. The cost of the district officials and police amounted to £10,514. Two charitable dispensaries are maintained for the relief of the sick. In the hill country the climate is temperate and healthy. In the cold season ice is frequently seen in the small tanks at an elevation of about 2000 feet. Until May the hot wind is little felt, while during the rains the weather is cool and agreeable. The average annual rainfall amounts to 36 inches.

CHINDWARA, the principal town and administrative head-quarters of the district of the same name, situated on the banks of the Bodhi nala. The site of the town is 2200 feet above sea level, and is surrounded by ranges of low hills. The European station extends for nearly two miles in length, and is well wooded. It is considered very healthy, and forms a resort for European visitors from Nagpur and Kāmthi during the hot weather. The conservancy arrangements are good, and the town is clean and cheerful. The population of the town in 1872 was returned as follows:—Hindus, 6189; Muhammadans, 1865; Buddhists and Jains, 152; Christians, 105; others, 315; total, 8626.

CHIABRERA, GABRIELLO (1552-1637), the Italian Pindar, as he is sometimes called, was of patrician descent, and was born at Savona, a little town in the domain of the Genoa republic, twenty-eight years after the birth of Ronsard, with whom he has far more in common than with the great Greek whose echo he sought to make himself. As he has told in the pleasant fragment of autobiography prefixed to his works, in which, like Cæsar, he speaks of himself in the third person, he was a posthumous child; he went to Rome at the age of nine years, under the care of his uncle Giovanni. There he read with a private tutor, suffered severely from two fevers in succession, and was sent at last, for the sake of society, to the Jesuits' College, where he remained till his twentieth year, studying philosophy, as he says, "più per trattenimento che per apprendere,"—rather for occupation than for learning's sake. Losing his uncle about this time, Chiabrera returned to Savona, "again to see his own and be seen by them." In a little while, however, he returned to Rome, and entered the household of a Cardinal Camerlingo, where he remained for several years, frequenting the society of Paulus Manutius and of Sperone Speroni, the dramatist and critic of Tasso,

and attending the lectures and hearing the conversation of Mureto. His revenge of an insult offered him obliged him to betake himself once more to Savona, where, to amuse himself, he read poetry, and particularly Greek. The poets of his choice were Pindar and Anacreon, and these he studied till it grew to be his ambition to reproduce in his own tongue their rhythms and structures, and so to enrich his country with a new form of verse,—in his own words, "like his countryman, Columbus, to find a new world or drown." His reputation was made at once; but he seldom quitted Savona, though often invited to do so, saving for journeys of pleasure, in which he greatly delighted, and for occasional visits to the courts of princes, whither he was often summoned, for his verse's sake, and in his capacity as a dramatist. At the ripe age of fifty he took to himself a wife, one Lelia Pavese, by whom he had no children. After a simple and blameless life, during which he produced a vast quantity of verse—epic, tragic, pastoral, lyrical, and satirical—he died in 1637, at the patriarchal age of eighty-five. An epitaph was written for him in elegant Latin by Urban VIII.; but on his tombstone are graven two quaint Italian hexameters of his own, in which the gazer is warned from the poet's own example not to prefer Parnassus to Calvary.

A maker of odes in all their elaborate pomp of strophe and antistrophe, a master of new and complex rhythms, a coiner of ambitious words and composite epithets, an employer of audacious transpositions and inversions, and the inventor of a new system of poetic diction,—it is not surprising that Chiabrera should have been compared with Ronsard. Both were destined to suffer eclipse as great and sudden as had been their glory. Ronsard was succeeded by Malherbe and by French literature, properly so-called; Chiabrera was the last of the great Italians, and after him literature languished till the second renaissance under Manzoni. Chiabrera, however, was a man of merit, apart from that of the mere innovator. Setting aside his epics and dramas (one of the latter received the honours of translation at the hands of Nicolas Chrétien, a sort of scenic Du Bartas), much of his work remains yet readable and pleasant. His grand Pindarics are dull, it is true, but some of his *Canzonette*, like the anacreontics of Ronsard, are exceedingly elegant and graceful. His autobiographical sketch is also extremely interesting. The simple old poet, with his adoration of Greek (when a thing pleased him greatly he was wont to talk of it as "Greek Verse"), his delight in journeys and sight-seeing, his dislike for literary talk save with intimates and equals, his vanities and vengeance, his pride in the memory of favours bestowed on him by popes and princes, his "*infinita meraviglia*" over Virgil's versification and metaphor, his fondness for maserline rhymes and blank verse, his quiet Christianity, is a figure deserving perhaps of more study than is likely to be bestowed on that "new world" of art which it was his glory to fancy his own, by discovery and by conquest.

The best editions of Chiabrera are those of Rome, 1718, 3 vols. 8vo; of Venice, 1731, 4 vols. 8vo; of Leghorn, 1781, 5 vols. 12mo; and of Milan, 1807, 3 vols. 8vo. These only contain his lyric work; all the rest he wrote has been long forgotten.

CHIARAMONTE, a town of Sicily, in the province of Syracuse, and 32 miles west from the city of that name. It is regularly built, with broad and straight streets. The view from the Capuchin convent is one of the finest in Sicily; and there is a well-preserved castle. The environs produce excellent wine. Population, 9300.

CHIARI, an ancient walled town of Italy, in the province of Brescin, and 12 miles west of the city of that name, near the left bank of the Oglio. It has several churches, a hospital, and a public library, and manufactures silk, cotton, and leather. In 1701 it was the scene

of the victory of the Austrians under Prince Eugene over the Spaniards and French. Population, 9479.

CHIAVARI, a maritime town of North Italy, in the province of Genoa, and 21 miles E.S.E. of the town of that name, on the Gulf of Rapallo, at the mouth of the Sturla. It has a hospital, a railway station, and several fine churches, the principal of which is that of the Madonna del' Orto. The Genoa and Sarzano railway passes the town. The inhabitants, numbering about 11,500, are engaged in the manufacture of furniture, silk twist, lace, and linen, and in the anchovy fishery. The surrounding hills are well cultivated, and slate and marble are quarried in the neighbourhood.

CHIAVENNA, or CLÄFEN, a small town of Italy, in the province of Sondrio, in a deep valley on the right bank of the Maira, and about seven miles from its entrance into the Lake of Como. From its situation at the junction of the great roads over the Splügen and Septimer, between Germany and Italy, it is a place of considerable trade, especially in the wines of the Valtelline, and the pottery manufactured in the vicinity. Its principal manufacture is silk, and its beer is reckoned the best in Northern Italy. Its most remarkable church is San Lorenzo, with a carved font of the 12th century ; and on a neighbouring height are extensive ruins of an ancient castle. The town was known to the Romans as Clavenna, and probably was of some importance from its position. In the Middle Ages it was an independent imperial countship, till it was at last seized by the dukes of Milan, and bestowed on the Balbioni family. For a long time it was an object of contest between the bishops of Coire and the canton of the Grisons ; and at last it fell to the latter in 1512. Incorporated with the Cisalpine republic in 1797, it passed in 1814 to Lombardy, and thus in 1859 to the kingdom of Italy. Population, 3900.

CHICAGO, in Cook county, State of Illinois, is probably the fourth city in size, and certainly the second in commercial importance, in the United States of America. It is situated on the west shore of Lake Michigan, 960 miles by rail from New York. Dearborn Observatory, $3\frac{1}{2}$ miles S. and $\frac{3}{4}$ mile E. from the court-house, is in $41^{\circ} 50' 1''$ N. lat. and $87^{\circ} 34' 8''$ W. long. The surrounding country is prairie land, with a loam soil, and a ridge running north and south two miles or more west from the lake. The city is at an elevation of nearly 600 feet above the sea level, but only 14 feet above the lake. When it was originally settled, the elevation above the lake was not more than 7 feet ; the level was subsequently raised 7 feet, beginning about the year 1855 ; the streets were filled in, and the largest houses elevated by means of jack-screws, without being vacated for purposes either of business or of residence. The climate is healthful and invigorating, and the city is kept singularly clear of all forms of malaria by the prevailing winds. The average death-rate for several years was 23.1 per thousand inhabitants, as compared with 25.3 in Philadelphia, 32.6 in New York, and 30.8 in Boston. The area of the city comprises 23,000 acres, and extends over seven miles north and south along the lake shore, and 5 miles east and west ; there were 226,000 building lots of 25 by 125 feet in 1875. The streets intersect each other at right angles. There is an inlet called the Chicago River which runs from the lake nearly a mile west, then separates into two branches, one running north-west, the other south-west, thus dividing the city into three divisions, connected by more than 35 bridges, and by two tunnels running under the bed of the river. This river (" Chacagua," Indian for thunder, and so called after the Indian Thor, or thunder god) gave the city its name. Originally it emptied into the lake, but a remarkable piece of engineering caused it to change its

course, and, so to speak, run " up-hill." The Illinois and Michigan canal, with which the main branch of the river is connected, was so deepened as to draw the water out from the lake ; the canal empties into the Illinois River,

Plan of Chicago.

1. Wicker Park.

3. Court House.
4. University

and the Illinois River into the Mississippi River, so that the water of Lake Michigan flows into the Gulf of Mexico. The river has been so deepened that the largest vessels may be towed into any of its branches, which are supplied with docks and water-slips, affording a dockage capacity of nearly 40 miles, more than 20 of which are already in use. The population, including the residents of the suburban towns (of which there are more than 50, composed exclusively of families of men doing business in Chicago), exceeds 500,000 ; but the population of the city proper, as ascertained at different dates since its organization in the year 1837, is as follows :—

Date of Census.	Taken by.	Population.
July, 1837	City	4,170
July, 1840	U. S	4,479
July, 1843	City	7,580
July, 1845	State	12,088
September, 1846	City	14,169
October, 1847	City	16,859
September, 1848	City	20,023
August, 1849	City	23,047
August, 1850	U. S.	29,963
December, 1853	City	59,130
June, 1855	State	80,000
August, 1856	City	84,113
August, 1860	U. S.	109,206
October, 1862	City	138,166
October, 1864	City	169,358
October, 1865	State	178,492
October, 1866	City	200,418
October, 1868	City	252,054
August, 1870	U. S.	306,605
October, 1872	City	367,396
October, 1874	City	395,408
May, 1876	Estimated	420,000

This growth, which is no less than 570 per cent. within 20 years, is regarded as without a parallel. The

foreign population in 1870, numbering 144,557 in all, comprised 52,318 Germans, 39,988 Irish, 10,027 English, 4197 Scotch, 565 Welsh, 6374 Norwegians, 6154 Swedes, 1243 Danes, 1226 Swiss, 1418 French, and 9648 from the British provinces in America.

Government and Finances.—The City Government consists of a mayor and common council of 36 members, elected once every two years by a popular vote. There are 18 political districts called "wards," each of which elects two members to the council. The council is vested with plenary powers as to taxes, appropriations, contracts, &c.; but the bonded debt is limited, by a provision in the constitution of the State, to 5 per cent. on the taxable valuation of all the property. The valuation of all property, personal and real, for taxable purposes (rated at about one-half the actual value) in 1875 was \$293,188,950; the tax-levy, \$5,123,905; the bonded debt, \$13,456,000; the floating debt, about \$4,000,000, abundantly covered by uncollected taxes. Chicago is represented in the National Congress of the United States by three members.

Trade and Commerce.—The amount of trade for 1875 was estimated at close upon \$657,000,000, made up as follows:—

Produce trade.....	\$232,328,000
Wholesale business	203,900,000
Manufactures.....	177,000,000
Total	\$703,228,000
Less manufactures included in the wholesale business.....	46,228,000
Total business.....	\$657,000,000
Total in 1874.....	639,000,000

This business was a growth from \$20,000,000 in 1852, since which time there has been a steady increase. The value of the shipments from Chicago of the products of the farm was stated as follows in the annual report for 1875 of the Board of Trade (an association meeting daily, with a membership of 1922):—

Flour and grain equal to 72,369,104 bushels, estimated value	\$57,500,000
Live stock	56,600,000
Produce of cattle and hogs.....	53,500,000
Produce of the dairy	5,700,000
Wool and hides	25,800,000
High wines and alcohol	11,300,000
Seeds and broom corn	3,200,000
Sundry other commodities	1,700,000
Total	\$215,300,000
Corresponding estimate for 1873,	197,400,000
Corresponding estimate for 1873,	180,000,000

The lumber trade showed the receipt of 1,147,193,432 feet and 635,708,120 shingles. The value of the cattle, hogs, sheep, and horses received at the Union Stock Yards during that year was \$117,533,941. There is a growing direct trade with Europe. The value of the importations for 1875 was estimated at \$10,000,000, meaning those alone which came to Chicago without being stopped for duty at any seaport city; and the direct exportations increased from 7213 tons in 1869 to 219,387 tons in 1875. The total volume of produce pouring through the city was estimated that year at 7,000,000 tons, or 700,000 car-loads, if it had all come by rail; or at the rate of 13½ tons for every minute in the year, including nights, Sundays, and holidays. There are 18 grain elevators, with an aggregate storage capacity of 14,650,000 bushels. These are vast store-houses where the grain is elevated from cars and ships, and disposed according to grades, then reloaded on cars and ships, all the work being done by machinery. The shipments of bread stuffs for 1835 were 2,262,030 barrels flour, 23,183,683 bushels wheat, 26,469,420 bushels corn, 10,230,208 bushels of oats, 1,834,117

bushels of barley, and 310,609 bushels of rye. There was a total city consumption of 67,825,311 bushels of grain. The shipments of provisions for that year were 56,040 barrels of beef, 311,170 barrels of pork, 182,068 tons of meat, 57,490 tons of lard, 3701 tons of tallow, 154,559 dressed hogs. The receipts of live stock during that year were 920,843 cattle, 3,912,110 hogs, 418,948 sheep, and 11,329 horses,—a total of 5,251,901, excluding horses. The aggregate of the wholesale trade of that year was estimated at \$293,900,000, being an increase of 7½ per cent. over the previous year. The capital invested in wholesale houses (exclusive of that invested in other cities, but connected with Chicago) was \$63,200,000. The statistics of manufactures at that date were as follows:—

Number of establishments	2,240
Number of employes.....	62,600
Wages paid.....	\$28,676,000
Capital employed	69,550,000
Value of products	177,000,000

The principal industries are hog-packing (the number of hogs packed in 1875 being 2,069,200), beef-packing, brewing and distilling, and the manufacture of iron and steel, wood, brick, leather, chemicals, boots and shoes, and cigars and tobacco. There is an annual industrial exhibition held in a building especially erected for that purpose, 200 feet wide and 800 feet long, which attracts exhibitors for one month from all parts of the north-west, and which was visited in October 1875 by 276,000 persons. The shipping of Chicago for 1875 was as follows:—number of vessels arrived, 10,488, with a tonnage of 3,122,004; vessels cleared, 10,607, with a tonnage of 3,157,651. There are eighteen trunk lines of railroads running from Chicago, five to the east, and the others west and south, viz.—The Baltimore and Ohio; Lake Shore and Michigan Southern; Pittsburgh, Fort Wayne, and Chicago; Pittsburgh, Cincinnati, and St. Louis; Michigan Central; Chicago and Michigan; Chicago and Alton; Chicago, Danville, and Vincennes; Chicago and Iowa; Chicago, Rock Island, and Pacific; Chicago and North-western (comprising three trunk lines); Chicago and Pacific; Chicago, Milwaukee, and St. Paul; Illinois Central; Western Union; Chicago, Burlington, and Quincy. The aggregate mileage of the railroads centring directly in Chicago is nearly 10,000 miles, and 750 trains arrive and depart daily; but it is estimated that Chicago has an uninterrupted connection with more than one-third of the entire railroad mileage of the continent, which is more than 70,000 miles. A notable peculiarity of the Chicago railway system is that it has been built almost entirely by capital outside of Chicago, and was centred in that city because of its superior advantages as the entrepôt of the north-west. The mails received in Chicago weigh 64,400 pounds daily. The banking capital of Chicago at the latest reports was as follows:—National banks (those organized under the provisions of the United States law) \$13,381,000; State banks (organized under the State law) \$7,165,000; private bankers, \$3,885,000; total, \$24,431,000. The annual bank clearings for three consecutive years were as follows:—1872, \$993,060,503; 1873, \$1,047,027,828; 1874, \$1,101,347,918.

The Fire of 1871.—The most notable event in the history of Chicago was the destructive fire of 1871, the largest of modern times. The conflagration commenced by the overturning of a lamp, in a district built up almost exclusively of wood, about 9 o'clock in the evening of Sunday, October 8, 1871; it continued through that night and the greater part of the next day, lapping up great blocks of houses, and growing by what it fed on. It was finally checked by explosions of gunpowder in a line of houses on the south of the fire, and exhausted itself on the

CHICAGO

by burning all there was to cover in each division of the city white. The area burned division (in which the fire originated), as follows:—West division, 460 acres; north division, 1470 194 acres; south area burned was 2124 acres, or nearly 3 acres. The total about 4 miles in length, and from 1 to 1½ mile square miles. The season had been excessively dry; the rain fall in Chicago for the summer had been only 28½ per cent. of average. There was a strong south-west wind, made a fire the sirocco by the heat, and taking irregular, fantastic, and uncontrollable offshoots and eddies, which spread the fire in all directions except west. The city fire department, though large and efficient, had been exhausted by an unusually extended fire the Saturday preceding, and the flames outran even their earliest efforts. Wooden buildings were scattered throughout the entire city, acting as brands to spread the conflagration. These were the main conditions of the fire. The total number of buildings destroyed was 17,450, and 98,860 people were rendered homeless; of the latter 250 perished in the flames or lost their lives from exposure. Thousands, flying before the flames, sought refuge in the lake, and remained standing in the water for hours as the only means of preservation against the intense heat and the shower of sparks and cinders. Among the buildings destroyed were the custom-houses, post-office, court-house, chamber of commerce, and nearly all the churches, railway stations, hotels, banks, theatres, newspaper offices, and buildings of a quasi-public character. It is estimated that 73 miles frontage of streets was burned over, most of which had been improved with wood block pavements; these were partially destroyed. The total loss has been estimated at \$196,000,000,—of which \$53,000,000 represented the value of the buildings destroyed, \$58,710,000 the personal effects, and the remainder business stocks, produce, and manufactures of every description. On the losses there was an insurance of \$88,634,122, of which about one-half was recovered. A vast system of relief was organized, which received the most generous aid from all parts of the world. The money contributions from the various States and from abroad were \$4,996,782; of this England contributed nearly \$500,000. These funds, which were over and above the contributions of food, clothing, and supplies, were made to last, under the careful and honest administration of a society of citizens, till the close of the year 1876. Out of them temporary homes were provided for nearly 40,000 people; barracks and shelter-houses were erected, workmen were supplied with tools, and women with sewing-machines; the sick were cared for and the dead buried; and the poorer classes of Chicago were probably never so comfortable as within two or three years after this fire. The work of rebuilding the city was accomplished with marvellous rapidity. Immediately after the fire the most sanguine persons predicted that it would require at least ten years to restore the buildings that had been destroyed. But within three years the city was provided with buildings equal in capacity, and of twofold value. The work was begun before the cinders were cold, and the population seemed to gain new ambition and new energy from the disaster. The "fire limits" were extended so as to exclude the erection of other than stone, brick, or iron buildings within a large area, and subsequently this prohibition was applied to the entire city. The result has been to make New Chicago the most beautiful city in America in its business centres. Within the first year after the fire, buildings had been erected or started covering a frontage of 51,619 feet, and costing, when finished, \$40,133,600. That the work was not spasmodic is shown from the fact that, in the year 1874, the frontage of new buildings was 33,065 feet, and the cost \$5,785,441; and in 1875 the frontage was 55,470 feet (about 10½ miles) and the cost

\$9,778,080. The materials used were mostly brick, a pure white sandstone known as Athens (Illinois) marble, a grey sandstone from Ohio and Michigan, and a brown sandstone from Lake Superior. The business and population continued to increase in spite of the disaster,—indeed the ratio of growth became larger. The solidity and permanence of this prosperity were confirmed during the American panic of 1873, when the Chicago banks alone, among those of all large cities, were not compelled to issue certificates of deposit, but continued steadily to pay out current funds. There were few mercantile failures, and the business of the year following the panic still showed an increase. This superior resistance to the general contraction has been attributed to Chicago's position as the distributing point of the breadstuffs and provisions of the great North-West. The comparative value of Chicago real-estate is an interesting illustration of its rapid growth. An example case may be cited of one piece of ground in an outlying district which sold in 1868 for \$50 an acre, and was resold in 1873 for \$1500 an acre. Land obtained 40 years ago from the Government at \$1.25 an acre is now worth \$10,000 an acre. Business property which was sold in 1865 for \$250 a front foot (with a depth of 125 feet), was resold in 1871 for \$1500 a front foot. Another piece of property which was valued at \$3845 in 1866 was sold in 1872 for \$100,000. These instances are not exceptional, but represent fairly the increase of values. The highest price ever paid for business property in Chicago was \$52,500 per square foot, but the average value of first-class business property is \$25 per square foot. The aggregate transfers of Chicago property in 1873 amounted to \$1,584,273,391.

Education, Religion, Charities, &c.—The public school system in Chicago is regarded as one of the most thorough in the United States. In 1855 the first report of the Board of Education showed the enrolment of 3000 pupils; the report of 1875 gave the number as 49,121. There was then an annual expenditure of \$827,502 to sustain the schools; there were 57 school buildings; 700 teachers were employed; and the annual cost of tuition per pupil was \$15.16. Of the 102,555 persons in Chicago between the ages of six and twenty-one, besides the 49,121 in the public schools, there were 27,071 in private schools, and 15,947 at work. There were 33,547 neither at work nor in school, but only 186 of all were found who could neither read nor write. The graded system of study is used, and the schools are classified as follows:—1 high school, course of study four years; 3 division high schools (one for each division in the city), course of study two years; 1 normal school for the preparation especially of teachers; the others are grammar schools and primary schools, the former embracing the four highest grades, and the latter the four lowest grades. The school year consists of ten months divided into three terms; the hours of attendance in the grammar and primary schools are 9 A.M. till noon, and 2 P.M. till 4 P.M. The principal studies in the grammar schools are theory of arithmetic, problems in arithmetic, geography, history of the United States, language, composition, reading, spelling, penmanship; drawing and music are also taught, and the study of German is optional. The course of studies in the high schools is that of the higher academies. Corporal punishment was abandoned altogether about the year 1865, and the reading of the Bible was discontinued in 1875, in deference to the dogmatic differences among the religious sects, the theory of the schools being free and secular. Of other educational institutions, besides 82 ordinary private schools, there are a large number of "Kindergarten" schools, in imitation of the favourite German system for elementary instruction. Among the higher institutions is the university of Chicago, connected with which is the Dearborn Observatory, which has a refracting

telescope of 23 feet focal length and 18½ inches aperture. There are also the North-Western University (Methodist), the Baptist Union Theological Seminary, Chicago Theological Seminary, St Ignatius College (Catholic), College of Law, Chicago Musical College, and 7 medical colleges. The principal charitable institutions are the Nursery and Half-Orphan Asylum, Protestant Orphan Asylum, Reform and Industrial School, Erring Women's Refuge, Foundlings' Home, Good Samaritan Industrial Home, Home for the Friendless, Old People's Home, Soldiers' Home, St Joseph's Orphan Asylum (Catholic), Lutheran Orphan Asylum, Washingtonian Home (temperance reform), all liberally endowed, and 10 hospitals. There are 83 benevolent and other open societies, 49 masonic and other secret societies (exclusive of industrial unions), 14 theatres and opera houses, 84 newspapers (daily and weekly), 25 large hotels, and numerous smaller and private hotels. There are 8 libraries open to the public, of which the Chicago Public Library (established in 1872, and supported by taxation) is the largest; in 1875, three years after it was opened, there were more than 40,000 volumes, and the aggregate circulation of books during that year was 399,156 volumes, the whole number of visitors 236,021, and the total issue of periodicals 135,355. There are 238 houses of public worship in Chicago, including the mission churches. The churches are divided among the different denominations as follows:—Roman Catholic, 28; Baptist, 25; Presbyterian, 24; Methodist, 22; Episcopal, 18; Lutheran, 18; Congregational, 15; Jewish, 8; Free Baptist, 2; Christian, 4; Dutch Reformed, 2; Reformed Episcopal, 3; Evangelical, 11; Coloured Methodist, 2; German Methodist, 2; Scandinavian Methodist, 4; Swedenborgian, 5; Unitarian, 4; Universalist, 4; miscellaneous and mission, 37. The value of church property in Chicago (exempt from taxation under the law) is estimated at \$12,000,000, of which \$5,000,000 is owned by the Roman Catholic Church.

Public Works, Parks, Streets, &c.—Of the public buildings destroyed by the fire, the custom-house and the city hall were still in course of erection in 1876. The National Government appropriated \$4,000,000 for the former, and the cost of the latter was estimated at \$2,500,000. Among the other public buildings are the county jail, bridewell, the water-works, and a large number of engine-houses and police-stations. The total cost of maintaining and enlarging the public works in 1875 was \$9,368,649, the water system being self-sustaining. The water supply of the city is drawn from two miles out in the lake. A large structure of iron and heavy timber, loaded with stone, and called a "crib," 98 feet in diameter, was located at that distance from the shore. In the centre compartment an iron cylinder is sunk 64 feet, of which 31 feet are below the bottom of the lake, the water being 33 feet deep. Connected with it are two distinct tunnels leading to two separate sets of pumping works. The tunnels are 66 feet below the level of the shore, one with a diameter of 5, and the other of 10 feet. The latter extends also three miles under the city, so that the two pumping works are removed that distance, and along its line are located 17 large subterranean wells or cisterns for use in case of fires. The cost of these tunnels was \$1,500,000. Their capacity is 150,000,000 gallons; the capacity of the pumping engines is 80,000,000 gallons in 24 hours. Telegraphic communication is kept up constantly by cables between the "crib" and pumping works. The water is always pure, cold, and wholesome, and it may be raised to a height of 155 feet for distribution. The consumption for 1875 was 1,449,825,000 gallons. There are over 3860 miles of water pipe, varying from 4 to 24 inches in diameter, 2607 public hydrants, and 2132 stop-cocks. There are over

240 miles of sewers, which cost \$4,236,769, and 609 miles of streets, of which 112 miles are paved; of the latter 87 miles are of the wooden block pavement. The side walks of the city measure 725 miles; and there are nearly 60 miles of horse-railways or tramways for intra-mural transit. The park system of Chicago is one of the most extensive in the world. Two parks are in the south division, one containing 372 acres, and the other 593 acres. The latter has a frontage on Lake Michigan of 1½ miles, and the two embrace 14 miles of interior drives, and 30 miles of walks. The larger of the two is to have a series of interior lakes connected with Lake Michigan, and protected by a pier several hundred feet long, so that they may be reached by boats from the lake. The approaches to these two parks are two roadways, each 200 feet wide, known as Grand and Drexel Boulevards. The former may be compared to the Rotten Row in Hyde Park, London; the latter is modelled after the Avenue l'Impératrice, Paris, with a continuous stretch of floral ornamentation in the centre. The west division parks, inside the city limits, comprise Humboldt Park, 225 acres; Central Park, 185 acres; and Douglas Park, 180 acres. The ornamentation is varied and elaborate. Lincoln Park, within the northern limits of the city, contains 230 acres, and has a lake shore drive of several miles. All these parks are connected by wide roadways, varying from 150 to 300 feet in width, and giving a continuous drive of 35 miles. The parks are supplied with water from a number of Artesian wells. Besides these principal parks, there are the following public places in the different divisions of the city:—Lake Park, 42 acres; Union Park, 11 acres; Jefferson Park, 6 acres; Washington Square, 2 acres; Union Square, 1 acre; Dearborn Park, 1 acre; Ellis Park, 3 acres; Vernon Park, 3 acres; Wicker Park, 3 acres. There are thus 1856 acres set aside by Chicago for public grounds. (J. B. R.)

CHICHELY, or CHICHELE, HENRY (1362–1443), an English primate, was born at Higham Ferrers, in Northamptonshire, in 1362. After studying at Oxford, he was sent on various embassies to the Papal and French courts; in 1409, he was representative of England in the Council of Pisa, which deposed Gregory and Benedict, and elevated Alexander V. to the papacy; and, in 1414, he became archbishop of Canterbury. He was distinguished for his zeal in the cause of the English Church, which he defended against the pretension of the Pope to dispose of ecclesiastical preferments. He was also, on the other hand, a determined opponent of Wycliffe. He spent much of his wealth in the establishment of All Soul's College, Oxford, and in adorning Canterbury Cathedral and Lambeth Palace.

CHICHESTER, a municipal and parliamentary borough, episcopal city, and market-town of England, in Sussex, situated at the foot of a small spur of the South Down Hills, on the widest part of the plain to which it gives name. It is distant about 60 miles S.W. from London, and 14 N.E. from Portsmouth. Chichester still retains its ancient walls, which have a circuit of about a mile and a half, and probably follow the line of the Roman fortifications. The town is well-built, and consists of four principal streets, which meet at right angles at a central octagonal cross, fifty feet high, erected by Bishop Story, and reported to be one of the finest structures of the kind in Great Britain. Of the public buildings the most remarkable are the cathedral, which is 407 feet in

Arms of Chichester.

length and 150 in breadth, and is note-worthy as having double side-aisles, the church of St Paul—a modern Gothic edifice, the guild-hall, the corn-exchange, the market-house, the infirmary, and the museum of the Chichester Literary Society and Mechanics' Institute. There is also a large cattle-market at the east of the city capable of accommodating several thousand head of cattle. It is one of the principal cattle-markets in the south of England, and was erected in 1871 by the corporation of the city at a cost of £15,000. In the cathedral are a number of ancient and curious monuments, besides nine by Flaxman, one of which is in memory of the poet Collins, who was a native of the city, and is buried in the church of St Andrew's. The diocese of Chichester includes the whole county of Sussex except a few parishes which are peculiars, and comprises nearly 300 benefices. The palace of the bishop is in the city of Chichester. There is a grammar-school, founded by Bishop Story in 1497, and the blue-coat school boards and educates about 30 boys. Chichester communicates with the sea by means of a short canal. The borough, which returns one member to parliament, had a population of 9054 in 1871.

Arms of Bishopric.

Chichester, as already mentioned, is undoubtedly built on an ancient Roman site, near a line of road now known as the Stano Street; and it is usually, though hardly with absolute certainty, identified with *Regnum*, a town of the Belgæ mentioned in the Itinerary of Antonine. A slab of grey Sussex marble, now preserved at Goodwood, was discovered in 1713 on the site of the present council chamber, bearing an inscription which has given rise to an ingenious hypothesis, which represents Chichester as the seat of the native king Cogidubnus, mentioned by Tacitus as possessing independent authority, and this king as the father of the Claudia to whom reference is made in the Second Epistle to Timothy. The inscription proves at least that the town was the abode of a considerable body of craftsmen, and that they erected a temple to Neptune and Minerva under the patronage of a certain Pudens. With the conjectural restoration of a few letters it reads as follows:—"Neptuni et Minervæ templum pro salute domus divinæ ex auctoritate T'ib. Claud. Cogidubni r. leg. aug. in Brit. Collegium fabror. et qui in eo a sacris sunt d. s. d. donante aream Pudente Pudentini fil." In the early Saxon period the town seems to have been destroyed by Ælla, and soon afterwards restored by Cissa, whose memory is preserved in the modern name, equivalent to Cissa's Caster, or Castrum. In 967 it was chosen by King Edgar as the seat of a mint, and specimens of the pennies are still extant. At the time of the Conquest it had only 283 houses and a church; but in 1083 the bishopric was removed thither from Selsey, and a cathedral was consecrated in 1108. This building having been destroyed by fire, a new one was erected in the end of the 12th century by Bishops Ralph and Seffrid, and this may be regarded as the basis of the present edifice. In 1213 the city was formally incorporated. During the civil war it was captured from the Royalists by Sir William Waller, whose soldiers did great damage to the cathedral. In spite of all attempts to preserve it, the tower and spire came to the ground in 1861; but a restoration has since been effected under the direction of Sir G. Gilbert Scott. Besides the poet Collins, Chichester numbers among its worthies Bishop Juxon, Hayley the friend of Cowper, and three artists of the 18th century, generally known as the "Three Smiths of Chichester." See Lower's *Sussex*, s.v.; *Quarterly Review*, vol. xcvii.

CHICKASAWS, a tribe of North American Indians, now settled in a reservation of 6840 square miles in the Indian territory on the left bank of the Red River. According to their own tradition and the evidence of philology, they are closely connected with the Creeks and Choctaws; and they believe that they emigrated along with these tribes from the West, crossed the Mississippi, and settled in the district that now forms the north-east part of the state of that name. Here they were visited by De Soto in 1540. From the first they showed a hostile spirit against the French colonists, and frequently engaged with them in actual conflict. With the English, on the other hand, their relations were more satisfactory. In 1786 they made a treaty with the United States; and in 1793 they assisted the Whites in their operations against the Creeks. In the early years of the present century part of their territory was ceded for certain annuities, and a portion of the tribe migrated to Arkansas; and in 1832-34, the remainder, amounting to about 3600, surrendered to the United States the 6,442,400 acres of which they were still possessed, and entered into a treaty with the Choctaws for incorporation with that tribe. In 1855, however, they effected a separation of this union, with which they had soon grown dissatisfied; and by payment to the Choctaws of \$150,000 obtained a complete right to their present territory. In the civil war of 1861 they joined the Confederates and suffered in consequence; but their rights were restored by the treaty of 1865. In 1866 they surrendered 7,000,000 acres; and in 1873 they adopted their former slaves. They possess a governor, a senate, and a house of representatives, and maintain 14 schools with about 500 pupils. In 1873 they numbered about 6000, and had private property to the value of \$2,000,000.

CHICLANA, a town of Spain in the province of Cadiz, 13 miles south-east from that city, divided by the River Tiro into the Banda and Lugor quarters. It contains the residences of many of the Cadiz merchants, possesses baths of great celebrity, and is a favourite resort of the lower classes. In the neighbourhood is Medina Sidonia, supposed by some to be the Phœnician *Asidon*; and about 5 miles south is the field of Barossa, where the Anglo-Spanish army under Sir Thomas Graham (Lord Lynedoch) defeated the French under Marshal Victor, March 5, 1811. Population about 8600.

CHICOPEE, a town of the United States, in Hampden county, Massachusetts, at the confluence of the Chicopee river with the Connecticut, 95 miles by rail W.S.W. of Boston. It comprises the villages of Cabotville and Chicopee Falls, and forms a flourishing manufacturing centre. Among its principal establishments are seven cotton mills with upwards of 114,000 spindles, the works of the Ames Company (which are the chief source of small arms in the United States), a woollen mill, two manufactories of agricultural implements, and several foundries. The town dates from 1640, and till 1848 formed part of Springfield. Population in 1870, 9607.

CHICORY. The Cheiory or Suceory plant, *Cichorium Inybus* (natural order, *Compositæ*), in its wild state is a native of Great Britain, occurring most frequently in dry chalky soils, and by road-sides. It has a long fleshy tap-root, a rigid branching hairy stem rising to a height of 2 to 3 feet,—the leaves around the base being lobed and toothed, not unlike those of the dandelion. The flower heads are of a bright blue colour, few in number, and measure nearly an inch and a half across. Chicory is cultivated much more extensively on the Continent—in Holland, Belgium, France, and Germany,—than in Great Britain; and as a cultivated plant it has three distinct applications. Its roots roasted and ground are used as a substitute for, adulterant of, or addition to coffee; both

roots and leaves are employed as salads; and the plant is grown as a fodder or herbage crop which is greedily consumed by cattle. In Great Britain it is chiefly in its first capacity, in connection with coffee, that chicory is employed. A large proportion of the chicory root used for this purpose is obtained from Belgium and other neighbouring Continental countries; but a considerable quantity is now cultivated in England, chiefly in Yorkshire. For the preparation of chicory the older stout white roots are selected, and after washing they are sliced up into small pieces and kiln-dried. In this condition the material is sold to the chicory roaster, by whom it is roasted till it assumes a deep brown colour; afterwards when ground it is in external characteristics very like coffee, but, is destitute of its pleasing aromatic odour. Neither does the roasted chicory possess any trace of the alkaloid caffeine which gives their peculiar virtues to coffee, tea, and other diet drinks. The fact, however, that for a hundred years it has been successfully used as a substitute for or recognized addition to coffee, while in the meantime innumerable other substances have been tried for the same purpose and abandoned, indicates that it is agreeable or beneficial to some constitutions. It gives the coffee additional colour, bitterness, and body, and may perhaps, as a sedative, tonic, and diuretic, modify its stimulant and irritating effects. It is at least in very extensive and general use; and in Belgium especially its infusion is largely drunk as an independent beverage. The leaves blanched form a favourite salad on the Continent, known in Paris as *Barbe du Capucin*. In Belgium the fresh roots are boiled and eaten with butter, and throughout the Continent the roots are stored for use as salads during winter.

The *Endive* (*Cichorium Endivia*) is a closely allied plant, cultivated on account of its leaves alone, which, when blanched, constitute a valued salad, and are also sometimes cooked fresh. It was cultivated and esteemed by the ancient Egyptians, Greeks, and Romans.

CHIERI, a town of Italy, in the province of Turin, and eight miles south-east of the city of that name, with which it is connected by a good carriage road. It stands on the declivity of a hill, and is divided into two parts by a branch of the *Tepice*. Among its numerous churches and convents, mention may be made of Santa Maria della Scala, which is one of the largest Gothic structures in Piedmont, and occupies, it is said, the site of an ancient temple of Minerva. The town also possesses a large number of benevolent and educational institutions and a theatre. It ranks as one of the oldest manufacturing centres in Europe, and still prosecutes the fabrication of silk, cotton, and woollen goods. The population is about 12,000. According to some investigators, Chieri is to be identified with the Roman city of *Carrea Potentia*; but, be this as it may, it appears in history at an early period. In the 9th and 10th centuries it was subject to the bishop of Turin; in the 11th it became an independent republic; and in 1155 it was compelled by Barbarossa to recognize again the episcopal authority. In the following centuries it went through numerous vicissitudes of war and politics, but at the same time developed its industrial activity. About the middle, indeed, of the 15th century, no fewer than 100,000 pieces of cotton goods were annually manufactured. In 1551 the town was laid waste by the French. By Victor Emmanuel it was raised to the rank of a principedom; and Cibrario, the historian of North Italy, thought it worth his while to devote two volumes to the preservation of its annals, *Delle Storie di Chieri*, Turin, 1827.

CHIETI, or **CIVITA DI CHIETI**, a town of Italy, capital of the province of Abruzzo Citeriore, situated on a hill near the Pescara, about six miles from the Adriatic, and 40

east of Aquila, with which it will shortly have railway communication. It is the seat of an archbishop and a prefect, and has a fine cathedral, a gymnasium, a hospital, several monastic buildings, and a handsome theatre. There are numerous remains of the ancient *Teate*, of which the most important are seven halls, probably belonging to a bathing establishment, a large theatre, a gateway, and several inscriptions referring to the Asinian family; while the churches of Sta Maria del Tricaglio and S. Paolo are built respectively on the sites of the temples of Hercules and Diana Trivia. The principal industries are the manufacture of woollen and silk goods; and there is a trade in corn, wine, oil, and the other productions of the neighbourhood. Teate was the chief city of the Marrucini, and under the Roman dominion continued to be a place of considerable prosperity. It seems to have been the native city of the Asinii and the Vettii. After the fall of the Roman empire it passed into the hands of the Goths and the Lombards, was destroyed by Pepin, and was restored by the Normans. In 1524 it gave its name to the order of the Theatines founded by its bishop Gaetano. Population, 23,000.

CHIHUAHUA, a city of Mexico, capital of the state of the same name, lies in a beautiful valley opening towards the north, and hemmed in on the other sides by arms of the Sierra Madre, 4640 feet above the level of the sea, in 28° 38' N. lat. and 106° 30' W. long. The town is regularly built, and the streets are wide and clean, with many handsome and convenient houses, plentifully supplied with water, which is brought to the town by an aqueduct three miles in length. The grand square, three sides of which are occupied by public edifices and stores, and the fourth by the cathedral, an imposing building of the 18th century, has its spacious area adorned with fountains, walks, and benches, and with pillars of white porphyry. The principal buildings, besides the cathedral, are the mint, the prison, which was formerly a Jesuit convent, the house of correction, two hospitals, and the military school. In the square in front of the Jesuit chapel of San Felipe, is a simple monument in memory of the three martyrs of Mexican independence, Hidalgo, Allende, and Jimenez, who were shot on the spot by the Spaniards. The town was founded in 1691, and in the 18th century was the seat of the captain-general of the Inner Provinces. At the time of its greatest prosperity it had about 70,000 inhabitants; but its present population does not exceed 14,000.

CHILDERS, ROBERT CESAR (1838–1876), an eminent Oriental scholar, was the son of the Rev. Charles Childers, English chaplain at Nice. In 1860 he received an appointment in the civil service of Ceylon, which he retained until 1864, when he was compelled to return to England owing to ill-health. He had acquired some knowledge of Pali during his residence in Ceylon, but it was not until the autumn of 1868 that, under the advice of Dr Rost, he gave himself to the scientific study of the language. Entering at once on the task of preparing a Pali dictionary, he laboured at it with such extraordinary assiduity that he was able to publish the first volume in 1872, and the second and concluding volume in 1875. The work is an enduring monument of learning and zeal, and has been gratefully acknowledged by a competent authority as "the most valuable contribution that has yet been made to the knowledge of Pali, and as the foundation of all future study of that language." Mr Childers was a frequent contributor on subjects connected with Buddhism to scientific and literary periodicals. In 1872 he was appointed sub-librarian at the India Office, and in the following year he became the first professor of Pali and Buddhist literature at University College, London. He died at London on the 25th July, 1876.

CHILI

See Plate
XI. of vol.
i.

CHILI, or **CHILE**, occupies a strip of land on the western side of South America, extending from 24° to $56^{\circ} 28' 50''$ S. lat., from the Bay of Mejillones to Cape Horn, a distance of 2270 miles. On the E. it is bounded by the Andes, on the W. by the Pacific Ocean, and on the N. by Bolivia. Its breadth varies from 40 to 200 miles, and its area is computed at 218,925 square miles, with a population of 2,319,266. Between lat. 24° and 32° (comprehending the provinces of Atacama, Coquimbo, and the northern half of Aconcagua) the principal industry is mining; between lat. 32° and 38° (comprehending the southern half of Aconcagua and the provinces of Valparaíso, Santiago, Colchagua, Curicó, Talca, Maule, Nuble, Concepción, and part of Arauco) the staples are agricultural produce and coal; while the remaining part produces timber, potatoes, and salted meat. The Andes extend in two parallel lines throughout nearly the entire length of the country. Between these two ranges or "Cordilleras" is a table-land, which attains its greatest breadth between lat. 33° and 40° , and which narrows both towards the northern and southern extremity, where the ramifications of both chains meet and form a continuous undulating plain. Chili further lays claim to the whole of Patagonia and Tierra del Fuego.

Mountains. *Mountains.*—The Andes commence in the district called the Colony of Magellan, where their general elevation is lowest, the perpetual snow-line only 3000 feet, the highest peak, Mount Stokes, 6400 feet, and the coast excessively rough and broken and full of fiords of immense depth, fed by glaciers descending from the high lands. Northwards, towards lat. 41° , the coast becomes less indented, the range more continuous and elevated, and the peaks higher,—such as Minchinmadriva, 8000 feet, Corcobado Volcano 9158 feet, and Yanteles, 8030 feet. From lat. 41° , or from the southern extremity of the province of Llanquihue, commence the table-land and the parallel granitic belt that skirts the Chilean coast, which together nowhere exceed 120 geographical miles in breadth from the sea to the Andes. At this lat. the snow-line rises to 8000 feet, at Valparaíso (33° S. lat.) to 12,780 feet, and at Coquimbo (29° S. lat.) to 15,200 feet. The centre table-land is in lat. 41° under 200 feet above the sea; at Talca it rises to 350, at Rancagua to 1560, at Santiago to 1800; and it continues to increase in elevation as it extends northward. The mean elevation of the Andes in Chili is 11,830 feet. The culminating peak is the volcano of Aconcagua, in the province of Aconcagua, which reaches the height of 22,427 feet. The principal summits to the north of this are Cima del Mercedario, 22,302 feet, in lat. 32° , and Cima del Cobre, 18,320 feet, in lat. $28^{\circ} 30'$. South of Aconcagua, in the province of Santiago, are Juncal (19,495 feet), and the volcanoes of Tupungato (20,263), San José (20,000 feet), and Maipo (17,664 feet). In Arauco is the volcano of Villarica, 15,996 feet; in Talca, the great truncate mountain called the Descabezado, 12,757 feet; in the province of Nuble, the volcano of Chillan, 9446 feet; and in Llanquihue, the volcano of Osorno, 7396 feet. In the Chilean range there are 23 volcanoes, of which only a few, such as the volcanoes of Osorno, Villarica, Antuco, and San José, are occasionally active. There are many passes over the Andes from Chili to the Argentine Republic; but the western slope of the mountains being steeper than the eastern, the ascent from Chili is more laborious than from the Argentine Republic, into which the mountains descend by a series of terraces, consisting of Secondary strata terminating in the vast expanse of flat country or "Pampas," occupied by the Tertiary

formations. The passes may be said to be open during eight months of the year, but even at their best they can never be traversed by vehicles,—mules being the only means of conveyance. The highest of the passes, as well as the most frequented, are those of Doña Ana, 14,770 feet, and Colguén, 14,700 feet, in the province of Coquimbo; the Dehesa, 14,500 feet, east from Santiago and near the volcano of Tupungato; the Potos, 13,965 feet, and Uspallata, 13,125 feet, both in the province of Aconcagua; and the Planchon, 11,455 feet, in the province of Curicó. The part of the Andes bordering the province of Atacama may be crossed at numerous places at any period of the year, as the range there is generally free from snow.

Earthquakes.—Chili is subject to frequent earthquake shocks (*temblores*), which, without causing damage, occasion great much alarm lest they should be followed by the earthquake itself (*terremoto*). The occurrence of this terrible phenomenon is not indicated by any particular state of the weather, but it rarely happens during the night. It is the common belief that when shocks are frequent there is not much fear of their being followed by an earthquake, and certainly experience justifies that opinion. Though shocks are very common, earthquakes are rare,—the same province being the focus of one only about once in fifty years, though it is calculated one in every tenth year makes itself felt in some part of Chili.

Earthquakes manifest themselves by a quick horizontal and sometimes rotatory vibration, and when the focus is near the sea it also is agitated. The ground undulates, but very rarely bursts open; and even the most violent are over in a few seconds, though for some time afterwards (at gradually lengthening intervals from twelve hours) there is a succession of gradually lessening shocks. By the earthquake of February 1835 the Isl. of Santa María was uplifted, the southern end 8, the central part 9, and the northern end 10 feet; but both it and Concepción subsided a few weeks afterwards, and even lost part of their previous elevation. During this earthquake two great waves rolled over the town of Talcahuano; the deep sea, close in shore, was dry for a few moments, and smoke burst from the surface of the water. During a very smart earthquake at Coquimbo, in November 1849, the sea retired about 150 yards, and then rolled back about 12 feet high. An English ship, anchored in 7 fathoms water, in the neighbouring bay of Hetradum, nearly touched the bottom from the receding of the sea, which afterwards rolled in like a bore, and the water continued to ebb and flow for an hour and a half after the shock.

Lakes.—In the southern part of Chili there are several inland lakes abounding with fish, and frequented by numerous varieties of aquatic birds. The largest of these lakes is that of Llanquihue, situated in $41^{\circ} 10'$ S. lat., 197 feet above the sea, at the base of the volcano of Osorno, which rises 7199 feet above its surface. Its shape is triangular, its greatest length from north to south being 30 miles and greatest breadth 22 miles. The little river Maullin is its sole outlet, and conveys its surplus water to the Pacific, in lat. $41^{\circ} 35'$. In the neighbourhood are the lakes Todos los Santos or Esmeralda, 18 miles long by 6 broad, and Rupanco, 24 miles long by 4 broad. Twelve miles northward is Lake Ranco, 32 miles long by 18 broad. In lat. 39° is Lake Villarica or Llaquén, measuring 100 square miles. In the province of Concepción is Lake Guilleltué, measuring 50 square miles. Near Santiago, is Lake Aculeo, occupying about 8500 acres. In all these the water is fresh and pleasant to the taste; but in the small lakes situated near the coast, such as Bacalemu, Cahuil, Vichuquen, and Bolleruca the water is brackish.

Rivers.—The rivers, like the lakes, are much larger and more numerous in the south than in the north of Chili.

¹ For the general description of the Andes, see vol. i. p. 670-678, and the article *ANDRES*, vol. ii. pp. 15-18.

They are almost entirely fed by the melting of the snow on the Andes, but are also liable to swelling from the winter rains. A few are navigable for a short distance; but nearly all yield immense service to agriculture by irrigation, carrying, like the Nile, both substance and moisture to the otherwise barren plains. The largest river is the Biobio, which, rising near the volcano of Antuco, in lat. 38° 15', enters the Pacific after a course of 220 miles, where it is 2 miles broad. It is navigable for barges and small steamers as far as Nacimiento, 100 miles from the mouth.

The following is a list of the principal rivers, with the provinces through which they flow, and the lengths of their courses:—

Rivers.	Provinces.	Leagues.	Falling into
Biobio.....	Concepcion	74	Pacific Ocean.
Aconcagua.....	Aconcagua	60	"
Cauten, or Imperial.....	Valdivia	50	"
Maule.....	"	50	"
Cachapoal.....	Santiago	48	Topocalma.
Itata.....	Concepcion	46	Pacific Ocean.
Matquito.....	Talca	46	"
Topocalma, or Rapel.....	Colehagua	40	"
Bueno.....	Valdivia	37	"
Valdivia, or Callacalla.....	"	34	"
Coquimbo.....	Coquimbo	31	"
Cruces.....	Valdivia	31	Valdivia.
Maipo.....	Santiago	30	Pacific
Copapo.....	Atacama	30	"
Huasco.....	"	30	"
Ligua.....	Aconcagua	29	"
Tolten.....	Valdivia	29	"
Laja.....	Concepcion	28	Biobio.
Loucolori.....	Aconcagua	28	Pacific.
Limari.....	Coquimbo	27	"
Mapocho.....	Santiago	26	Maipo.
Vergara.....	Arauco	26	Biobio.
Juncal.....	Atacama	24	Pacific.
Tuboledo.....	Arauco	22	Biobio.

Mineral Waters are numerous in Chili; they are principally saline and sulphureous, containing carbonate of lime, bicarbonate of soda, and chloride of sodium. In temperature the waters range from 50° to that of boiling water. They are situated at various heights, from 1150 feet above the sea, as the baths of Panimavida, 18 miles from Talca, to 10,690 feet, as the baths of Toro, near Elqui in Coquimbo. The most remarkable as well as the most important of the bathing establishments is that of Chillan in the province of Chillan, on the western flank of the Cerro Nevado, 2050 feet above the sea, containing in close proximity icy cold and boiling springs,—sulphureous, ferruginous, alkaline, and saline. The season is from the first of December to the first of April, when they are visited by multitudes for the cure of gout, rheumatism, dyspepsia, and cutaneous diseases. Among the others most frequented are the baths of Apoquindo and Colina, near Santiago; Canquenes, near Rancagua; Tinguiririca, near Colehagua; Mondaca, near Talca; Trapa-Trapa, near Los Angeles; and Nalmelhuapi in Llanquihue.

Islands.—The most important Chilean islands are those of the province of Chiloe, covered with great forests of the magnificent cedar *Fitzroya patagonica*, and the tall and elegant cypress *Libocedrus tetragona*. The interesting island of Juan Fernandez may be included with those of Chili, although it is 360 miles from the coast, in lat. 33° 42' S. It is a mountainous and well-wooded island, 52 miles in circumference, and exhibits generally those features familiar to the readers of *Robinson Crusoe* as the abode of Alexander Selkirk. It is stocked with herds of goats, while the beach is a haunt of seals. Forty-two miles further out to sea is the smaller island of Mas Afuera.

Climate.—As Chili extends from hot parched deserts in the Tropic of Capricorn to a boisterous cold and wet country

within 12° of the Antarctic Circle, and as while one-fourth of the territory is not much above the level of the sea, another fourth lies slightly below the snow-line, the only general qualification that can be assigned to this union of extremes is that both in the high and the low, the wet and the dry, the hot and the cold regions the climate is healthily throughout. Omitting the inhospitable regions of Cape Horn and Tierra del Fuego, and commencing with the most southern portion colonized by Chili, the Territory of Magellan, between lat. 54° and 51° 50', we find that although the moisture and rainfall are too great for the ripening of wheat, yet potatoes, cabbage, celery, and carrots are readily grown. The principal town, Punta Arenas, is situated in the peninsula of New Brunswick, on the Straits of Magellan, in 53° 10' 30" S. lat. and 70° 50' W. long. The next zone, between lat. 51° 50' and 37°, comprehends the provinces of Chiloe, Llanquihue, Valdivia, and Arauco, of which the climate is very like that of Great Britain,—the most southern parts having more rain but less cold than the Highlands of Scotland, while the more northern have a more genial climate than the most favored parts of the south of England. In Valdivia the mean temperature throughout the year is 52° Fahr. Timber is the great article of export; but potatoes, wheat, barley, rye, and flax are grown in quantities sufficient for exportation. The next zone extends from 37° to 28° lat., embracing the provinces from Concepcion to Aconcagua, where irrigation is more or less necessary, and where flax, corn, grapes, figs, olives, peaches, and melons grow freely, but oranges and lemons only in the northern portion. Rain falls in June, July, and August with more or less frequency, according to the latitude. During these months a mild northerly wind prevails, interrupted occasionally by a dry wind from the east. During all the rest of the year a wind blows from the south, which falls towards the evening. In Santiago the mean annual temperature is 55° Fahr., and in Valparaiso 58° Fahr. From lat. 28° to 24°, including the provinces of Coquimbo and Atacama, there is a gradually decreasing amount of moisture,—from four or five showers of from five to ten hours, as in Coquimbo, to nothing but an occasional mist, as in Atacama. Spring commences in September, summer in December, autumn in March, and winter in June.

Population.—The following table gives the population of Chili according to a census taken in 1875, with the average number of births, deaths, marriages, and other kindred statistics:—

Provinces.	Population.	Deaths.	Proportion of Deaths to Population.	Marriages.	Proportion of Marriages to Population.	Births.		
						Legitimate.	Illegitimate.	Total.
Colouia de Magallanes.....	1,144	62	1 in 18	20	1 in 57	47	14	61
Chiloe.....	61,556	1,131	1 in 57	496	1 in 130	2,162	418	2,580
Llanquihue.....	48,492	916	1 in 53	415	1 in 117	1,577	367	1,944
Valdivia.....	37,481	618	1 in 61	239	1 in 157	1,134	452	1,586
Arauco.....	110,826	3,099	1 in 35	816	1 in 134	4,131	2,133	6,264
Concepcion.....	151,365	3,981	1 in 38	1,561	1 in 96	5,288	2,704	7,992
Nuble.....	136,880	3,668	1 in 35	1,172	1 in 107	4,366	1,572	5,938
Maule.....	237,311	6,257	1 in 38	1,622	1 in 145	7,480	3,000	10,480
Talca.....	110,359	3,588	1 in 31	1,016	1 in 109	4,543	993	5,536
Curico.....	92,110	2,312	1 in 40	753	1 in 123	3,281	585	3,866
Colehagua.....	146,889	3,911	1 in 37	1,313	1 in 109	6,034	1,054	7,088
Santiago.....	562,712	11,188	1 in 50	1,603	1 in 301	14,087	2,661	16,748
Valparaiso.....	176,682	6,504	1 in 27	1,428	1 in 124	6,286	1,668	7,954
Aconcagua.....	132,799	3,322	1 in 40	766	1 in 173	3,379	1,272	4,651
Coquimbo.....	157,463	3,662	1 in 43	879	1 in 161	3,588	1,768	5,356
Atacama.....	71,302	4,442	1 in 16	388	1 in 211	1,293	1,064	2,357
Total.....	2,068,424	55,897	1 in 37	16,670	1 in 124	68,616	21,755	90,371

It will be seen that the net amount of the population obtained by the census was 2,068,424; but 10 per cent. may be allowed for omissions, and 44,000 for wandering Araucanian and Patagonian tribes, which brings up the total number to about 2,320,000. One-third of the

population is urban, and two-thirds rural. Of the deaths no less than 59 per cent. are under seven years, 4·8 from seven to fifteen, 7·3 from fifteen to twenty-five, 15·3 from twenty-five to fifty, and 11·4 from fifty to eighty. Out of every million children born only 543,900 live to the age of five years. One female child is born for every 1·05 male children; but the death rate is in precisely the opposite proportion. The annual increase of the population is one in every fifty-seven.

Health.

Sanitary Condition.—The deaths, amounting to 55,897, are distributed among the different months of the year as follows:—January, 5333; February, 4398; March, 4228; April, 3937; May, 4423; June, 4213; July, 4613; August, 4773; September, 4767; October, 4940; November, 4749; December, 5523. The rate is greatest (9·9 per cent.) in December, and least (7·1 per cent.) in April.

It will be seen that the three provinces, Chiloé, Llanquihue, and Valdivia, which are the wettest are also the most salubrious. The healthiest period is just before the rains set in, the least healthy during the heats of December and January, when dysentery prevails, owing perhaps to a too free consumption of the water-melon. The mortality of children under 7 years ranges from 47 per cent. in some years to 60 per cent. in others of the whole number of deaths; and four-fifths of the children who die under 7 years of age belong to the poorest classes. The most fatal diseases are gastric, typhoid, and typhus fevers; and the next, pulmonary complaints, dysentery, and syphilis. The system of sewerage in Chili is generally bad, consisting of partially open channels passing through the houses, sometimes with running water and at other times nearly dry. Even Valparaíso is not well provided with drainage. Intermittent fevers are unknown, and Asiatic cholera has not yet passed the Andes.

History.

History.—The name Chili (or, in its Spanish form, Chile) is supposed to be derived from Tehile, a word belonging to the ancient language of Peru, signifying "snow." The country first became known to Europeans in the 16th century. It was then to a considerable extent under the dominion of the Incas, but had been previously inhabited by certain tribes of Indians, of whom the most important and only warlike race were the Araucanians.

In the time of the Inca Yupanqui (1433), grandfather of the monarch who occupied the throne of Peru on the arrival of the Spaniards, and the tenth in succession from Manco Capac, the reputed founder of the Peruvian empire, the first attempt was made by the Incas to extend their dominion over the territory of Chili. Yupanqui, leading his army across the desert of Atacama, and penetrating into the southern regions of the country, made himself master of a considerable portion of it. The permanent boundary of the dominions of this prince is said by some writers to have been determined by the River Maule, 35° 30' S. lat., although it is more probable the River Rapel, 34° 10' S. lat., constituted the extreme limits of the Peruvian empire towards the south. The latter opinion is to some extent supported by the fact, that the remains of an ancient Peruvian fortress, apparently marking the frontier, are still found upon the banks of the Rapel, while no such remains are known to exist in any part of the country farther south.

The Peruvian dominion in Chili ceased with the Inca Atahualpa in 1533. The first Spanish invasion was led by Diego de Almagro (1535 or 1536), who however met with such determined resistance from the Araucanians that he was compelled to retrace his steps. Undaunted by this failure, Pizarro despatched another expedition, composed of Spanish troops and Peruvian auxiliaries, under Don Pedro de Valdivia, and was preparing to follow it in person with a larger force, when he was assassinated in 1541.

Meanwhile Valdivia entered Chili, and fighting his way onwards, encamped on the banks of the Mapocho, where he founded the city of Santiago, the present capital of the republic, and about eleven years afterwards the town of Valdivia. At last, after twelve years' stay in Chili his life and conquests were brought to an end in a desperate engagement with the Araucanians, who for 180 years afterwards continued to wage a sanguinary war with the Spaniards, till 1722, when they consented to a treaty which fixed the River Biobio as the boundary between them. Spanish Chili, extending from the Biobio northward to Atacama, was divided into thirteen provinces, under the rule of a governor appointed by the viceroy of Peru. The last of these governors was Mateo de Toro, 1810.

During the entire period of this connection between Spain and Chili, the viceroys, governors, and all the other Spanish officials of every grade regarded the inhabitants only as a means of furthering their own aggrandizement, which at length so exasperated the better educated classes that they determined to throw off the hateful yoke on the first favourable occasion. In 1810 this desired opportunity at last presented itself, when Spain, overrun by the armies of France, was no longer able to vindicate her own claims to a national existence. In July of that year the Chilians took the first step towards asserting their independence by deposing the Spanish president, and putting in his place (September 18, 1810) a committee of seven men, nominated by themselves, to whom were entrusted all the executive powers. In April 1811 the first blood was spilt in the cause of Chilian independence. A battalion of royal troops, which had been drawn up in the great square of Santiago, was attacked by a detachment of patriot grenadiers, and routed with considerable loss on both sides. In the same year (December 20) the government was vested in a triumvirate, and Juan Jose Carrera was appointed general-in-chief of the army about to be formed.

In 1813 a powerful army, under the command of General Paroja, invaded Chili, but was twice defeated by the republican troops under Carrera. The royalists, however, speedily received larger reinforcements; and after a severe contest, Chili was once more obliged to own the sovereignty of Spain. For three years more the people submitted (under the Spanish governors Osorio and Pont) to the old system of tyranny and misgovernment, till at length the patriot refugees, having levied an army in La Plata, and received the support of the Buenos Ayreans, marched against the Spaniards, and completely defeated them at Chacabuco in 1817.

The patriots next proceeded to organize an elective government, of which San Martin, the general of the army, was nominated the supreme director. Their arrangements, however, were not completed when they were attacked once more by the royalists, and routed at the battle of Cancharayada with great loss. Betrayed into a fatal security by this success, the royalist troops neglected the most ordinary military precautions, and being suddenly attacked by the patriots in the plains of Maipu, were defeated with great slaughter. This victory secured the independence of Chili.

The new Republic had no sooner vindicated for itself a place among the nations of South America, than it resolved to assist the neighbouring state of Peru in achieving a similar independence, which object was at last effected after a bloody war of six years' duration. No small share of this success was due to the daring courage and consummate ability with which Lord Cochrane, under the most trying circumstances, conducted the naval affairs. In acknowledgment of these important services a well-executed statue of him has been erected in Valparaíso. With 1817 commenced again the national government, under the

directorship of General O'Higgins, who held it till 1823, when he was compelled to resign in consequence of a popular tumult. For a few weeks, a provisional triumvirate discharged the duties of an executive government. General Freire was next chosen director. During the period of three years in which he held the reins of government, the country was harassed by constant dissensions; and for the four years subsequent to his resignation it continued in a state of disorder bordering upon anarchy. From 1826 to 1830 the government was administered by six different directors, in addition to a second provisional triumvirate. In 1828, under the administration of General Pinto, a constitution was promulgated, which had the effect of temporarily reconciling political differences and calming party spirit. In 1831, however, when General Prieto was raised to the chief magistracy, a convention was called for the purpose of revising this constitution. The result of its deliberations was the present constitution of Chili, which was promulgated on the 25th of May 1833. From that time Chili has enjoyed remarkable prosperity, and its government has been administered with such firmness and regularity, that it occupies a high rank among nations, and its funds stand well in the Stock Exchange.

After holding office for ten years, Prieto retired, and was succeeded by General Bulnes, a distinguished officer of the war of independence. Like his predecessor, he was fortunate in finding in Manuel Montt an able and intelligent prime minister, who was to him what Portales had been to Prieto. In 1851 an insurrectionary movement broke out, headed by General Urriola, who, during the disturbances in Santiago in the *Semana Santa* was accidentally killed. The same party then brought forward as their candidate for the presidency General José Maria de la Cruz in opposition to D. Manuel Montt, but the latter was elected, and continued in office for two periods (1851-1861). To him succeeded José Joaquín Pérez (1861-1871), who in 1871 was followed by Federico Errázuriz, and he in his turn by Anibal Pinto in 1876. The administration of recent presidents has been conducted with firmness, wisdom, and prudence. They have been ready to use their influence for the reform of abuses and for the advancement of civil and religious liberty, and for the promotion of every thing which could tend to increase the prosperity of the country.

Races.

Races.—The greater part of Chili, when Ahmagro invaded it, was inhabited by the *Araucanians*, who were, with other Indians, partly exterminated, but more generally absorbed into the Chilian nationality as at present existing. A remnant of independent Araucanians still occupy a province south of the Biobío; but they scarcely number 24,000, and are on the decrease. These Araucanians are divided into tribes, whose chief, called a cacique, has from two to six wives, or even more, according to his means of supporting them and their progeny. They cultivate maize, rear herds of horses, sheep, and cattle, weave coarse woollens, build comfortable cottages, binding the beams together by the rope creeper *Lardizabala biternata*, and from the reed *Chusquea Colou* make shafts for their lances. They acknowledge a creator god called Pillan, and some inferior divinities, such as Eponeman, the god of war, Moilen, the god of good, and Guñenbu, the god of evil. They have neither temples nor priests, their worship consisting of the sacrificing of some animal under a tree belonging to the Magnolia order, the *Drymis chilensis*, which is considered sacred by them. This tree was first described by Dr Winter, who accompanied Drake in his expedition round Cape Horn in 1577. The Araucanians believe also in sorcerers and enchantments, and that every natural death, other than by old age, is caused by the evil influence of some one, whose life the friends of the

deceased endeavour to take in expiation and revenge. The Patagonians who inhabit the territory of Magellan and Tierra del Fuego, and who may number about 20,000, are not given to polygamy. They worship one god called Cocho, and believe in the immortality of the soul. The average height of fifty Patagonians taken at random lately was found to be 6 feet 4½ inches. The tallest was 6 feet 8½ inches, and the least 6 feet and ½ inch. The *Chilians* themselves hold the same position to Spain as the inhabitants of the United States do towards England. Their instincts and language are Spanish, modified by admixture and intercourse with other nations. The conventionalities of social life are much the same in Chili as in France, Belgium and Catholic Germany; and this remark applies to dress, living, amusements, and propensities. Sunday is spent as a holiday, and enlivened by festivals, balls, theatricals, and concerts. Cricket and athletic sports are unknown, but good horsemanship is common. The great extent of seashore not only induces large numbers of the inhabitants to visit foreign lands (calculated to average 78,000), but promotes the diffusion of the civilization of the most highly cultivated nations over the whole of Chili. The beautiful provinces of Valdivia and Llanquihue are colonized by Germans and North Americans, who prepare timber, meat, cheese, butter, beer, cider, and leather. The university and the learned professions have ever numbered among their distinguished members Polish, French, German, and English men of science. The North American colonists have been chiefly instrumental in the construction of flour-mills, telegraphs, and railways. At the commercial centres, such as Valparaiso, Concepcion, Copiapo, Coquimbo, and Huasco, many of the leading Chilian citizens are of English, French, and German descent. There are in the country about 35,000 Europeans, chiefly Germans, French, and English.

Constitution.—By the constitution adopted on the 25th Constitution. of May 1833, the sovereignty is declared to reside in the people; but the exercise of its functions is delegated to three distinct powers—the legislative, the executive, and the judicial. The legislative power is committed to the Legislative National Congress, which consists of the Chambers of Deputies and Senators. The Chamber of Deputies comprises over 100 members, elected for a term of three years, on the principle of equal electoral districts with cumulative voting, and by a suffrage enjoyed by all citizens who are of twenty-one years of age if married, or twenty-five if unmarried, and who are able to read and write, and pay yearly taxes to a certain amount.

The senate is composed of fewer members, chosen by Senate. indirect election in each province for a term of nine years. One-third of the house is renewed every three years.

The Chamber of Deputies and the Senate have concurrent Chambers. as well as separate functions. The former body alone can impeach the higher officers of the state before the Senate. It originates all money bills, and measures relating to the military forces of the country. The Senate alone has the right of pronouncing judgment on public functionaries impeached by the Chamber of Deputies; it confirms ecclesiastical nominations, and in certain cases gives or withholds its consent to the Acts of the executive. In all other proceedings of the legislature the concurrent voice of the two houses is necessary. Laws may originate with either body, but require to be passed by both houses, sanctioned by the president (after consultation with the Council of State), and promulgated by the minister to whose department the matter relates. The period during which the Congress sits is limited to the three winter months; but the session may be prolonged by the president for fifty days. On the day before the regular session closes, the senators elect seven of their number to form the conserva-

tive committee, which replaces Congress during its prorogation in the duty of observing the conduct of the executive.

President. The executive power is committed to the president, with a salary of £3600, as supreme chief of the nation. He is chosen by indirect election, and holds office for a term of five years, after expiry of which he is not eligible for re-election until other five years have elapsed. The president concludes treaties, and declares peace or war; he appoints and removes ministers, councillors, and clerks of department, as well as diplomatic representatives, consuls, and the administrative officers of provinces. He also inducts the higher legal and judicial functionaries; but the nomination of these officers, as well as of ecclesiastical dignitaries, must proceed from the Council of State. He distributes the army and navy at will; and when, with the sanction of the Senate, he assumes the command of the national troops in person, he has the exclusive bestowal of naval and military commissions, though ordinarily appointments of this nature must be approved by the Senate.

The president is liable to impeachment for mal-administration for a year after the expiry of his authority. During that time he is not allowed to leave the country, except with the permission of Congress. All the other officers of Government are subject to the same law; but in their case the time is more limited.

Council of State. The Council of State is composed of ministers in the exercise of their functions, a member of the courts of justice, an ecclesiastical dignitary, a general or admiral, a chief of the administration of finances, and one ex-minister or diplomatic agent,—all named by the president, together with six other councillors, named one-half by the Senate and one-half by the Chamber of Deputies. The duties of the Council of State are to advise and act as a check upon the president.

Executive department. The government is conducted by five cabinet ministers, each with a salary of £1200. The Ministro del Interior presides over the preparation of the national statistics, over roads and railroads, public buildings, and hospitals; the Ministro de Hacienda over the finance; the Ministro de Justicia, Culto, é Instruccion over the law and prisons, the church, and education; the Ministro de Guerra over the army and navy; and the Ministro del Exterior over foreign affairs and colonization. The president has no power of enforcing obedience to orders relating to any one of these departments until they have been confirmed by the minister in charge. The ministers are entitled to take part in all the debates of Congress; but, unless holding at the same time the office of senator or of deputy, they are not allowed to vote. Any of them may be impeached by the Chamber of Deputies for treason against the laws of the state, or for the mal-administration of the duties of his office. An action may be brought against them even by private individuals who have suffered by any of their acts if the Senate, to whom appeal must in the first place be made, decide that there is sufficient ground for complaint.

Local government.—Upon the executive depend directly the administrative officials throughout the country. For administrative purposes Chili is divided into fifteen provinces, each with subordinate departments, subdelegations, and districts, and one settlement, viz., the provinces of Atacama, Coquimbo, Valparaiso, Aconcagua, Santiago, Colchagua, Curicó, Talca, Maule, Nuble, Concepcion, Arauco, Valdivia, Llanquihue, and Chiloé, and the settlement of Magellan. The capital is Santiago, on the Mapocho. Each of the provinces is governed by an intendant, who is nominated by the president, and holds office for three years. The departments are under governors, who hold office for

a similar term. The intendant generally acts as governor in that department in which the capital of the province is situated, and is, at the same time, mayor of the municipal corporation; but the authority of this body is very limited, as it cannot dispose even of its local funds without the permission of Government. The subdelegates are appointed by the governors for a period of two years, as are also the inspectors of districts. Both these offices are compulsory,—those who decline to serve being liable to fines.

The united revenue of the municipal corporations of Chili amounts to about £500,000, of which about £80,000 is contributed by the State, and the remainder derived from local sources.

The procedure of the Chilean courts of justice is based on the same fundamental principles as those which hold among the Latin nations generally, and approximates therefore to that of equity. Evidence is mostly taken by depositions in writing. The suitor appears by a sworn procurator or attorney, who must be conversant with the technicalities of the law. In the higher courts, the aid of an advocate is further obligatory. The advocate, who combines the functions of the consulting lawyer with those of the barrister, is only admitted to practice after taking a university degree, and passing an examination by the Supreme Court. Trial by jury is unknown, except as applied in a modified form to libel cases connected with the press. The whole law of Chili is being gradually digested into codes,—the civil, penal, commercial, &c.

The supreme court, which sits at Santiago, takes cognizance of criminal and civil causes alike. Its decisions are final, and also bind the Government upon questions of law submitted for the consideration of the bench. There are three courts of intermediate appeal, sitting in Santiago, Serena, and Concepcion, which also have both criminal and civil jurisdiction, and whose decisions are final in certain cases.

In each department of every province there are one or more salaried judges of letters (or judges learned in the law), who divide among them the local jurisdiction,—the criminal and civil sides being, in places of importance, vested in different judges, each of whom, as a rule, sits alone. Below these, again, are the judges of subdelegations and of districts, of whom the latter can only decide civil cases when the value at issue is below £10, and in criminal causes can arrest the criminal and prepare evidence; while the former decides civil suits up to £40 value, hears appeals from the district judge, and takes cognizance of minor criminal offences.

In places where access to a judge of letters is difficult, an alcalde or local police magistrate retains a limited jurisdiction. With a view to reduce litigation, the law expressly encourages reference to arbitration in various forms; and the duties of public prosecutor and public advocate are performed by officials, who intervene before the higher courts and the judges of letters in all cases which involve public morality, or the interests of the State, of minors, of the incapable, of the absent, and of charitable trusts.

Military and ecclesiastical offences come under the cognizance of special tribunals, but neither ecclesiastical nor military persons are, as such, exempt from the jurisdiction of the ordinary tribunals in respect of offences against the law of the land. Certain special jurisdiction is reserved to the Council of State and to the revenue courts; and under a treaty with Great Britain, guaranteeing the mutual right of search in suspected slave vessels, a mixed tribunal decides, without appeal, as to the validity of capture.

The clerks and secretaries of the higher courts, and the secretaries of the judges of letters, must be qualified advocates, as also the notaries public, who are charged

with drawing up and preserving legal instruments, some among their number being particularly entrusted with the registry of landed property, and of deeds of partnership, having then the title of notary conservator. The registers are open to public inspection.

Beligion.

Religion.—The form of worship recognized by the constitution is the Roman Catholic, yet Government tolerates the public profession of others. For the purposes of ecclesiastical administration, Chili is divided into four dioceses—one archbishopric and 3 bishoprics—which are subdivided into 144 parishes. The salary of the archbishop is £1600, of the bishops of Concepcion and Serena £1200 each, and of Aneud £1000. The salaries of the curates range from £20 per annum to £200. The mission department is under the direction of Capuchin friars, and consists of a prefect and sub-prefect, and a staff of 30 missionaries and several chaplains, stationed in the provinces of Aranco, Valdivia, Llanquihue, and Magallanes. Their labours among the adult Indians produced little fruit, but in their schools they have been more successful. Worship, including salaries and repairs of churches, costs Government annually £63,425.

In Santiago there is one handsome Protestant church, in Valparaiso three, and a chapel in Talca. Roman Catholicism exists in a mild form among the educated classes, but with a good deal of superstition among the miners and peasantry (*huasos* and *inquilinos*). There is only one great place of pilgrimage in Chili, and that is to an image of the Virgin in the church of Andacollo, a small village near Serena. Upwards of 20,000 persons visit it annually, and the yearly festival is occasionally presided over by the bishop of the province, when the image is carried in procession round the square. The greatest devotees are the miners.

Education.

Education.—The first educational establishments in rank are the University and the National Institute of Santiago. The university, which grants degrees in law and medicine, has 37 professors, besides numerous assistants, and is attended by nearly 700 students. It is governed by a rector and a vice-rector, a secretary, and the five deacons of the faculties of humanity, mathematics, medicine, law, and theology, who are also charged with the inspection of education in all schools throughout the republic. Whoever has the necessary elementary knowledge may attend the classes without paying fees.

The preparatory section or "Institute," corresponding with our high schools, is under the management of a rector, a vice-rector, 48 masters, and several inspectors. It is attended by about 1000 pupils, of whom only those pay who lodge and board in the establishment, this costing £32 a year. The institute is endowed with 45 exhibitions or bursaries, 15 of which are divided equally among youths from Peru, Bolivia, and Ecuador.

These two establishments cost the Government annually £25,000. Lycæums, on the same plan as the National Institute, are established in every provincial capital, 16 altogether, and are supported by local taxation, government grants, and fees from pupils. In these institutions boarders pay an annual sum of £20, and day scholars £2; 8s.; but many receive instruction gratuitously. The directly practical branches of education receive the largest share of attention, but the learned languages are not neglected. The lycæums of Talca, Concepcion, and Serena possess the privilege of granting degrees in mathematics and chemistry.

Government expends annually on the lycæums in the province £35,000, and they are attended by 2200 pupils. Government supports besides 810 schools throughout the country, in which 62,220 children are taught the catechism, reading, writing, arithmetic, and geography. Those who choose may learn in addition the histories of Chili and America, sacred history, drawing, music, and sewing. There are also 480 private schools, with 24,000 pupils, which differ more in the rank of the children than in the subjects taught.

One in every 3·8 of the population in Santiago can read, and 1 in every 4·4 can both read and write—and the proportion is nearly the same in the provinces of Atacama, Coquimbo, Valparaiso, Con-

cepcion, and Chiloe; while in the entire population of the republic one in 7 can read, and one in 8 can both read and write. Upon an average 1 child for every 24·71 inhabitants goes to school. In the public schools each child costs Government an average of 45 shillings.

Table showing the number of children educated at the public and private schools, and the proportion of pupils to inhabitants.

	Number of Inhabitants.	Pupils.	Number of Inhabitants to each Pupil.
Atacama	71,302	3,936	18·12
Coquimbo	157,463	6,134	25·67
Aconcagua	132,799	5,656	25·67
Valparaiso	176,682	9,900	17·84
Santiago	362,712	19,656	18·44
Colechagua	146,889	4,746	30·95
Curico	92,110	3,146	29·28
Talca	110,350	4,082	27·03
Linares	237,334	1,707	48·13
Maulco		3,223	
Nuble	136,880	4,976	27·51
Concepcion	151,365	6,023	25·13
Aranco	140,896	3,297	42·73
Valdivia	37,481	1,463	25·55
Llanquihue	48,492	2,730	17·76
Chiloe	65,686	4,780	13·74
TOTAL	2,111,688	85,442	24·71

Educational Institutions for especial purposes.—For the education of priests there are seminaries in Serena, Valparaiso, Santiago, Talca, Concepcion, and Aneud, six in all, attended by about 535 young men, and costing Government £8000 annually. For the education of teachers, there are two schools for females and one for men. There are also in Santiago a school for the blind and another for the deaf and dumb.

In the military academy in Santiago there are 100 pupils, costing annually £7200; annexed to it is the naval academy, costing £2600, with 100 pupils. In Valparaiso is the practical naval school, costing £2600, with 100 pupils; a school for music, costing £750, with 100 pupils; an academy of painting, costing £1000, with 70 pupils; one of sculpture, costing £600, with 30 pupils; an agricultural and polytechnic school, with 90 pupils, costing £7200. There are also a national library and museum and observatory, costing annually about £4000. Masters are also employed to teach in prisons and in barracks. Altogether there are upwards of 1300 educational establishments, to which the State contributes £166,000, and these establishments are attended by about 93,000 pupils. Further to aid in the diffusion of knowledge Government distributes among the poorer schools text books, cheap editions of standard authors, —chiefly French translated into Spanish.

Beneficent Institutions.—In Chili there are 42 hospitals, Charities, with an average number of 41,930 patients; 18 lazarettoes (lazaros) with 2230 patients; 31 dispensaries, providing medicines during the year to 293,100 sick people; 1 asylum for the insane, with 575 patients; 4 foundling hospitals, with 845 children; 6 hospices, with 765 poor; 5 refuges for fallen women, with 610 inmates; and 5 establishments for orphans, with 590. For the support of these charities Government contributes annually on an average £51,500.

There are several prisons, one house of correction, and Prisons. a large penitentiary, the whole costing Government annually about £23,000.

Legations.—The Chilean legation for France and England Legations is in Paris. The minister's salary is £1800; with other salaries and sundries, it costs £3800. In Washington the expense of the legation is £1400; in Lima, £2800, in Bolivia £1300; in Buenos Ayres, which serves also for Brazil, £2600.

The Press.—The press in Chili is improving. There are one or more daily newspapers in every town of importance, and about 50 papers and magazines published weekly or monthly. The official organ of the Government is the *Arancano*; of the Law Courts, the *Gaceta de los Tribunales*; of the university, the *Anales de la*

Universidad, and of the Church, *La Revista Catolica*. There are also German and English newspapers. The national literature of Chili belongs chiefly to the belles lettres class, tinged with French ideas. The scientific writers are mostly foreigners or the descendants of foreigners. On an average, three times more books are imported from France than from England; ten times more than from Spain, or the United States, or Germany; and twenty-two times more than from Belgium.

Post-office.—The number of letters that passed through the post-office in 1874 was 5 millions; of newspapers, periodicals, and circulars, $7\frac{1}{2}$ millions; and of samples, 12,000, besides 336,000 official despatches.

Army and Navy.—The army of Chili, which in time of war has exceeded 4500 men, was reduced in 1875 to 3500, consisting of 700 cavalry, 2000 infantry, and 800 artillery. This force is distributed on sentry duties and upon the frontiers, but the real military strength of the country is the National Guard.

The National Guard, also divided into cavalry, infantry, and artillery, averaged 55,000 men from 1867 to 1871, but in 1875 had become reduced to 22,000, the country being at peace.

Navy. The navy consists of two powerful ironclads, the "Almirante Cochrane" and the "Valparaiso," constructed in England, each of 1000 horse-power, and of about 2000 metric tons measurement, besides three corvettes, a sloop, and several transport vessels on active service, and two corvettes allocated to the naval schools. All are steamers. The marine force amounted in 1875 to 1600 men, including sailors, engineers, officers, and 200 marines and artillerymen.

Minerals. *Mineral Productions.*—Chili is rich in minerals. Among its metals are gold, silver, copper, lead, antimony, cobalt, zinc, nickel, bismuth, iron, molybdenum, and quicksilver, found in mines in the northern division, while rich beds of coal occupy the southern division, but only copper, silver, and coal are profitable to any extent. The various ores are found in all the series of rocks between granite and trachyte, the latter being sterile in Chili. The veins generally run from N. and N.W. to S. and S.E.; in some places, however, their course is irregular, or they extend E. and W.

Gold. The auriferous veins run nearly parallel to the imperfect cleavage of the surrounding granite rocks. Copper ores, containing a small quantity of gold, are generally associated with micaceous specular iron. Some mines are remarkable for the variety of minerals mixed with the gold, such as galena, blende, copper and iron pyrites, and peroxide of iron. These substances are found disseminated in quartz veins running nearly N. and S. Near Iliapel are some very poor gold mines, in the beds of the gypseous formation, in altered felspathic clay-slate, which alternate with purple porphyritic conglomerate.

Silver. The richest silver mines are found in Jurassic rocks of the Oolitic formation in the province of Atacama. The richest districts are Chañarcillo, Tres Puntas, Florida, and Caracoles. In Chañarcillo the upper part of the mines produce immense quantities of embolite, while in those of Caracoles, on the frontier of Bolivia, the chloride of silver is found in still greater quantities. And in general these are the two kinds of silver ore met with most frequently in the upper region of the veins; while as the mines become deeper, the prevailing ores are various kinds of pyrrargyrite or red silver, polybasite, and argentite or the sulphuret of silver. Native silver, in smaller or larger masses, is generally found in the upper region, although at Chañarcillo, from the vein San Juan, at 325 feet below the surface, 800,000 ounces of metallic silver were extracted in a few months. Gold is also found in Magellan.

Copper. Copper is more equally distributed than silver over the northern provinces, and is mostly found in the lower granitic and metamorphic schistose series, where it is met with most abundantly as pyrites, although other ores are also common, such as bornite or variegated copper, the black oxide, malachite, and atacamite. Do-meykite, or arsenical copper, is found in the Calabozo mine, near Coquimbo; the hydrosilicate and olivenite in the mine San Antonio, near Copiapo; the vanadate of copper in cavities in an arseniophosphate of lead, along with amorphous carbonate of lead and copper, in Mina Grande or La Marquesa, near Arqueros. That rare ore, the oxychloride of copper, or atacamite, occurs at Reimolinos and Santa Rosa in veins in granite. The principal copper mines are in the provinces of Atacama, Coquimbo, and Aconcagua, and the most important are those of San Juan and Carrizal, near

Copiapo, La Higuera, near Coquimbo, and Tamaya, about 40 miles from the coast, and 70 from Coquimbo. This last is a mountain district about 3500 feet above the sea, which produces about 150,000 cwt. a year of various kinds of sulphurets, of a produce from 9 to 64 per cent. Tambillos, 10 leagues from Coquimbo, produces principally poor sulphurets; Runeral, near the river, entirely poor carbonates; Andacollo, carbonates, oxides, oxysulphurets, and native copper; La Higuera, black sulphurets and pyrites; Herradura and Huaseo, carbonates and sulphurets of low produce. In the Cordilleras, above Huaseo, are some mines containing ores of copper, silver, and lead combined together. Silver and copper mines are sold by the "barra," or twenty-fourth part of the share of the mine.

The most common ores of cobalt are the arsenate and the sulph-arsenate, containing from 19 to 22 per cent. of cobalt. The most important mine is the Veta Blanca of San Juan. At Tambillos and Huaseo there are mines containing glance cobalt, and arsenate or erythrine; the former sort is frequently combined with nickel, which has been found in considerable quantities in a mine in the Cordilleras above Copiapo.

The sulphuret of zinc is found in various parts, as well as antimony, lead, manganese, bismuth, mercury, and molybdena. Iron ores of every description are very abundant; amongst the most peculiar are coquimbite, or white copperas, and copiapite, or yellow copperas, much used by the inhabitants for dyeing and tanning, in the manufacture of ink, and for other purposes.

Gypsum is found in immense beds, particularly in the province of Santiago. The fine massive variety called alabaster is found at the Salto de Agua, near to Santiago, of a quality nearly equal to that of Italy. Lapis lazuli is found in the Cordilleras above the province of Coquimbo, but it is impossible to convey large slabs to the coast, and the principal use of the small pieces is to make ultramarine; but as the artificial equals the native in brilliancy of colour and permanency, it is not of much value. In the province of Atacama, where it borders on Bolivia, are extensive deposits of the nitrate of soda and the borate of lime and soda.

Of great and increasing importance are the coal mines in southern Chili, extending along the coast from the province of Concepcion in $36^{\circ} 50' S.$ lat. to the Straits of Magellan, including some of the islands of Chiloe. The richest and at the same time the oldest coal mines are immediately south from the Biobio at Coronel, Lota, and Lebu. These coal mines are worked on the same plan as those in England with all the modern improvements and accessories. Steamers coal at the pit's mouth, and a great deal of the ore that used to be carried to England to be smelted is now sent to Coronel and Lota. There are also extensive works for amalgamating silver and smelting ores in Copiapo, Chañarcillo, Carrizal, and Guayacan.

Of the entire metal exports copper is 70 per cent, and silver 25. The amount of coal produced annually is increasing so rapidly that it will probably soon average from 2 to 3 millions of tons. The average value of the minerals exported is above 46 per cent. of the value of the whole of the exports, while that of agricultural products is about 44 per cent.

Vegetable Kingdom.—The Chilean flora contains 128 genera. Flora. Twenty-two of the genera belonging to the continent of Europe are not indigenous to Chili, while, on the other hand, that country possesses thirty-six genera not belonging to Europe.

Agriculture.—Till Chili had to compete with California and Australia in the foreign markets, the products were of the most primitive description introduced by the natives. The corn was jointed sticks; corn was trodden out by mares or oxen, winnowed by throwing it up against the wind, and ground in small primitive mills. All this is now changed. The largest and most approved agricultural implements manufactured in the United States and in England are now employed, while the flour mills in power and machinery rival the best in Great Britain. Care is also being taken to improve the breeds by the introduction of horses, cattle, and sheep from England. About 82 per cent. of the entire surface of Chili is desert, mountain pasture, and forests, and only about 18 per cent. arable land. There are in the country 30,000 estates of various sizes, from many square miles to a few acres. The most important agricultural product, both for home consumption and exportation, is *wheat*, of which the average yield over the whole country is 7 for 1, and the average annual quantity from 1,305,000 to 1,380,000 quarters, of which about two-thirds are exported in grain, flour, and biscuit. In the province of Santiago the yield may be estimated at 12 for 1. Of *barley* the average annual production is 200,000 quarters, and the yield in the provinces in which it is cultivated 16 for 1. The value of the annual export averages £200,000. The rest is used as malt and food for horses. *Maize* is grown in every part of Chili excepting in Chiloe and the territory of Magellan, and yields 20 to 30 for one. In the green state it forms two of the principal national dishes, *chodlos* and *humitas*, eaten by both rich and poor. But the most universal national dish is supplied by the *kidney bean* (*Phaseolus vulgaris*) both in the green and the dry state. The average annual produce is 106,000 quarters, and the yield 9 for 1. South from the Maule, *pease* are more cultivated than kidney beans. The average produce is

27,000 quarters. The potato is indigenous to Chili. The largest quantity and the best are grown in the rainy provinces of Chiloé and Valdivia, where the yield varies from 10 to 40 for 1. The average annual produce is 3,100,000 bushels in the whole of Chili. Of walnuts the average annual produce is 48,000 bushels. Although there are 14,560 bearing olive trees in the country, the extraction of the oil from the berries is only beginning to receive due attention. There are 890,000 mulberry trees, but the breeding of silkworms has as yet not succeeded. The vines number from eighteen to twenty millions; and really good imitations of port and claret are made, although the great bulk goes to make a coarse brandy, a catelan-like wine called mosto, and the great beverages of the poorer classes, called chicha and chacoli. The most important

cattle is a lucerne, the *Medicago sativa*, all the warmer regions of Chili. It is sown in winter, 24 inches to the cuadra, under a sprinkling of earth, is cut from three to four times in the year, and irrigated from five to ten times, according to the nature of the soil, and yields of green food 40 tons the cuadra. Cattle brought from the mountains, and oxen that have been working in carts and in the plough, are speedily fattened on it, while cows fed on it yield rich milk and butter. The hills in the warm regions of Chili are sparingly covered with a short and wiry grass, which, after one winter of abundant rain, lasts for two seasons, even although the succeeding winter may have been dry.

The sterile plains and mountains produce the carob tree (*Ceratonia*) which, in defiance of a broiling sun, stretches out its spicuous limbs, covered with foliage, forming an agreeable retreat to the weary traveller by day as well as by night; the espino (*Acacia Cavendishii*) inferior to the carob tree in size, hardness, and durability of its timber; and the great torch thistle, whose long, smooth spines are used by the country people for knitting-needles, and whose interior woody substance, stripped of its fleshy bark, forms the beams and rafters of the cottages of the peasantry in the northern provinces. Timber is abundant in all the provinces S. of Santiago, but chiefly in Arauco, Valdivia, and Chiloé, which may be termed the forest region of Chili. There are altogether above a hundred different kinds of indigenous trees, of which not more than thirteen ever shed their leaves. Several have been found serviceable in ship-building, but for purposes of house-carpentry none afford an adequate substitute for pine. Ornamental woods are scarce, and too soft for the use of cabinet-makers. The principal timber trees are the roblo or Chilean oak (*Quercus obliqua*) which attains a height of 100 feet, and as the timber retains its soundness in water, it makes excellent stakes; the lingue (*Persea lingue*) 90 feet, which furnishes the best wood for furniture, while the bark is of great value in tanning; the pumo (*Cryptocarya pumna*), the bark of which is used in Valdivia for tanning,—the Germans exporting large quantities of first class sole leather, of which the largest quantity goes to England; two species of cypress, both exceeding in height the loftiest trees in England,—the timber of a reddish hue, is used for beams, doors, pillars, and ornamental flooring. The cypress (*Libocedrus chilensis*) grows on the Andes of the middle provinces, while the *Libocedrus tetragona* is found on the southern Andes. The quillay tree (*Quillaja Saponaria*) grows north from the Biobío. A decoction of the bark is used for clearing the colours in dyeing and cleansing articles of silk and woollen cloth, and as a wash for the hair. The laurel (*Lauretia aromatica*) is a tall handsome tree, but its wood warps so much that it is suitable only for the coarsest work. The luma (*Myrica Luma*) produces timber like the English oak than the Chilean oak. The Araucanian pino (*Araucaria imbricata*) 150 feet, flourishes on the mountains S. from the Biobío. When seen from a distance

the cone, which takes two years to grow, is about 2 inches long, which, when cooked, form more delicate eating than chestnuts. Under the governorship of O'Higgins their trunks were used for ship-masts; but at present the expense of bringing them to the coast prevents their being employed in this way. The Chilean cedar or morea (*Fitroya palayonica*) is the largest and most important tree in Chili. The wood is reddish, soft and durable, and not liable to warp. The trunk is divided into pieces of 8 feet long, and then split up into boards 6 or 7 inches broad, and about half an inch thick, which is, on account of the straightness of the fibre, very easily affected. An ordinary tree yields from 500 to 600 of these boards. The general height is from 150 to 180 feet. Yet some specimens have been met with 300 feet high and 60 in circumference, which yielded upwards of 5200 boards. The best grow in Llanquihue, Chiloé, and Valdivia. Indeed, the luxuriance of vegetation in these regions is as great as in the tropics. The forests are frequently quite impenetrable on account of the creepers and the "quila," a rudely branched reed, which, however, affords a good food for the cattle. A creeper (*Lardicabala biternata*) is used by the Araucanians instead of ropes. In the same districts grows likewise the coligú or colcu (*Clusquea Colcon*), a bamboo-like reed, which attains a height of 30 feet, and furnishes the shafts of the lances of the Araucanians and Pehuenches.

Fruit is plentiful. Besides the kinds already mentioned, in Valdivia there are large apple orchards, and further north pears,

cherries, and quinces. The strawberries of the south of Chili have long been famous, and are still unrivalled, especially those of Tonce.

Animals.—The most formidable animal in Chili is the puma, *Zoology* On account of its ravages in the farm-yard, it is frequently hunted with dogs, or caught by the lasso. The guanaco roams about among the lower regions of the Chilean Alps in herds numbering from 20 to 100. The vicuña is more rare; it inhabits the Andes of the province of Atacama. The huemul is found in the territory of Magellan, and in other districts the otter, wild cat, fox, and chinchilla. The horses of Chili are inferior in strength and height to those of England, but greatly superior in point of endurance. The mule is the beast of burden, and will carry on an average a load of 355 lb. a distance of 20 or even 30 miles a day. The beef is excellent; meat is mostly cured by drying, making it into charqui. In this manufacture several hundred head of cattle are killed at a time, the flesh rapidly stripped off the bones, cut into long thin shreds, and then dried in the sun.

Birds.—Among the birds of Chili the most remarkable is the condor, which is easily recognised by the white ruff encircling its neck. As its wings on an average extend 8 or 9 feet, its flight has a very majestic appearance. Humboldt mentions having seen one flying at the height of 22,000 feet above the level of the sea. They seem an exposed carcass for a great distance, but seldom carry off live prey. The turkey-buzzard is also common in the northern districts; white eagles, hawks, and owls are more numerous in the south. The only song-birds worthy of notice are,—the teneu, the thrush, the tordo (a kind of blackbird), and the loica (a kind of red-breast); but none of these can rival the notes of our English birds. The teneu is said to emulate the mocking-bird in imitative power. The tapaculo (*Pteropichus albicollis*), a bird about the same size as the thrush, rarely flies, but runs about with great agility, emitting an odd but cheerful note. The chingol, or sparrow, has gay plumage than his European representative. Besides these, paroquets, flamingoes, partridges, and woodpeckers abound in several localities, likewise the black-headed swan, and several varieties of crane. Palagonia has an ostrich much hunted by the Indians. The pelican, the penguin, and the shag inhabit the sea and the salt-water lakes.

Fish.—Great varieties of fish are found off the coast of Chili, and of these the pichiluen, which is caught chiefly in the Bay of Coquimbo, is regarded as a choice delicacy. There are small sweet oysters off Chiloé; huge mussels, barnacles, and fissurellae, off Concepcion; and large clams off Coquimbo; besides sea-urchins, cockles, and limpets, which are found along the whole coast.

Of the reptiles, which are all harmless, the most numerous are lizards; the snakes vary from 12 to 30 inches in length. Scorpions and large spiders are common, but not dangerous. Of beetles there are upwards of 4000 species not found in Europe. Chili is never infested by the clouds of locusts which from time to time devastate the neighbouring plains of the Argentine Republic. Small ants enter houses and attack provisions.

In 1844, J. P. Larrain made an unsuccessful attempt to introduce bees. Since then they have multiplied so fast that there are now upwards of 100,000 hives, producing on an average £50,000 worth of honey and wax annually, of which by far the greatest part is exported.

Manufactures.—The wealth of Chili consists in the development of its great and abundant resources, for which its scanty population is insufficient; hence manufactures which require many skilled hands and much cheap labour have as yet not prospered,—the cost of production being too great. But such works as flour mills, smelting works, tanneries, breweries, &c. have proved successful. Wine-making is a cloth mill, and at Valparaiso a large sugar refinery.

Numerous banks and insurance and other companies are conducted on the principle of limited liability. Both Santiago and Valparaiso are in this way furnished with street tramways, and the plan has of late been applied to mining.

Commerce.—The commerce of Chili has vastly increased since the time when the country lay torpid under the yoke of Spain. In 1855 the total value of the exports was under £4,000,000 sterling, now it averages £8,000,000. The imports were in 1855 a little above £3,500,000, now they average £7,000,000. The principal exports are copper in bars and ores, averaging £3,050,000; silver in bars and ores, averaging £560,000; wheat, flour, and biscuits, averaging £1,507,000; barley, £300,000; hay of Lucerne (*Medicago sativa*), £51,600; potatoes, £48,000; wanuts, £40,000; butter and cheese, £20,500; eggs, £22,000; hides, £22,000.

Of the imports 17 to 18 per cent. are for nutrition, such as sugar, imports, rice, and cattle; 20 to 21 per cent. are necessities of social life, as clothing, domestic utensils, crockery, drugs, machinery, tools, books, paper, &c.; and 13 to 14 per cent. are articles of luxury, such as rich carpets, satins, silks, and drapery, toys, cards, tobacco, perfumery, and musical instruments, pictures, statues, jewellery, tea, coffee, and yerba maté. This yerba, the dried leaves of the *Ilex paraguayensis*.

is infused in an urn-shaped cup from which it is sucked up through a small silver tube (bombilla).

The commercial intercourse of Chili is most extensive with Great Britain. The value of the Chilean exports to England averages annually £3,700,000, and the imports from England £3,900,000. The exports to France are about one-third of those to England, and the imports from France about one-fifth of those from England. Next follow Germany, Peru, the United States, Bolivia, Brazil, and the Argentine Republic.

Chili exports and imports both by sea and by the passes in the Cordillera. Mules do the land traffic, and formerly only sailing vessels the traffic by sea; but steamers are now taking their place. The value of the imports by land averages £198,000, and the exports £23,000; and the value of the imports by sea averages £9,802,000, and the exports £9,700,000, which in both cases includes goods in transit. Of the land imports the most valuable article is cattle, which are imported in large herds into the provinces of Coquimbo and Atacama from the Argentine Republic. The number of vessels that leave the ports of Chili averages 5900, with about 4,019,000 tons; and 5950 enter the ports, with about 4,059,880 tons. Of the total amount three-eighths are English and about the same Chilean, then follow the United States, French, German, Peruvian, Belgian, Dutch, and Portuguese vessels. The merchant navy of Chili in 1875 consisted of 28 steamers with 9880 metric tons, and 59 sailing vessels with 12,554 metric tons. Many small vessels, however, owned in Chili, have remained under the foreign flags to which they were transferred for safety during the last war with Spain.

Revenue. *Revenue.*—The annual income of Chili may be estimated at £3,550,000, and the expenditure at sometimes a little less and sometimes a little more. The chief source of revenue is the custom-house, which yields about half of the whole amount. Next in importance are the railways, yielding about a quarter of the whole; and after these, the monopoly of tobacco and cards, the land tax, trade licences, stamps, tolls, the mint, post-office, and telegraphs.

CHILLAN, a town of Chili, the capital of the province of Nuble, in a depression in the fertile plain between the rivers Nuble and Chillan, about 120 miles north-east of Concepcion, in 35° 56' S. lat. and 71° 37' W. long. The houses, with but few exceptions, consist of only a ground floor built round a rectangular court, and are constructed of sun-dried or baked bricks. The streets are about 22 yards wide and have open drains in the middle. The importance of the town consists in its being the centre of a large agricultural district of the greatest productiveness, which has a valuable outlet for its grain and cattle by means of the railway to Tomé. Hand-made lace is produced on designs which have become traditional in certain families. The district is also celebrated for its mineral baths. Chillan was originally founded by Ruiz de Gamboa in 1594, but it has since been frequently destroyed and rebuilt. In 1601 it was laid waste by the Moluche Indians, in 1657 by the Puelche Indians and an earthquake, by another earthquake in 1751, and in 1797 by the overflow of the River Nuble. This last catastrophe led the inhabitants to remove their city to a place called La Horea, where it was again levelled by the earthquake of 1835. Next year they began to build on the present site the now prosperous town, which has a population of 20,000.

CHILLIANWALLA, a town of British India in the Punjab, situated on the left bank of the River Jhelum,

National Debt.—The national debt amounts to about £10,000,000 sterling, of which about £2,000,000 is of internal and £8,000,000 of external debt. The whole of the latter has been contracted in England, and the bulk of it invested in existing railways and railways in construction, which yield both directly and indirectly a fair return. The wanton bombardment of Valparaiso by the Spanish fleet (March 31, 1866) having suggested to the Chileans the necessity of providing against such outrages, they have spent a great deal of money in the purchase of ironclads and in the construction of forts,—besides having had to rebuild the bonded warehouses destroyed at that time. A large sum has also been spent on the House of Congress, which is being built on an ambitious scale.

Communication.—Chili is connected with Europe by telegraph, and the wires ramify over the greater part of the country. Santiago and Valparaiso and all the most important towns southward as far as Talcahuano, are connected by rail. In the northern provinces are also railways, which facilitate the working of the mines.

On the 15th of October 1840, the first steamers of the Pacific Steam Navigation Company arrived at Valparaiso, the "Peru" (Captain Peacock) and the "Chili" (Captain Glover), both 700 tons. At first they sailed merely between Valparaiso and Callao, calling at the intermediate ports. In June 1846, the route was extended by Panama and the Isthmus to Europe. On the 13th of May 1868 the Company commenced their line between Liverpool and Chili by the Straits of Magellan, the first of their steamers which made the voyage being the "Pacific," 1174 tons.

Weights, Measures, and Money.—The weights and measures were formerly Spanish, but since January 1858 those of France are in force as the only legal ones.

In her monetary system Chili possesses the double standard, gold and silver, the coins being as follows:—Of gold, a ten-dollar piece, weighing 15·253 grammes, and pieces of five and two dollars in proportion; of silver, a dollar piece of 25 grammes, and pieces of fifty, twenty, ten, and five cents in proportion; and also two-cent pieces, and cent-pieces of a bronze containing zinc and nickel.

The gold and larger silver coins contain one-tenth of alloy; the smaller silver ones, which are of limited legal tender, are rather less pure. The bronze tokens, the emission of which has been limited to a value of about £20,000, replace the former coinage of copper. There is no Government paper; but some of the banks issue, under due restrictions, notes payable in coin. (C. B. B.—F. W.)

about 85 miles north-west of Lahore, in 32° 40' N. lat. and 73° 39' E. long. It is memorable as the scene of a sanguinary battle fought there on the 13th January 1849, between a British force commanded by Lord Gough and the Sikh army under Shere Singh. The loss of the British in killed and wounded amounted to 2269, of whom nearly 1000 were Europeans, while that of the Sikhs was estimated at 4000. An obelisk erected at Chillianwalla by the British Government preserves the names of the officers and men who fell in the action.

CHILLICOTHE, a city of the United States, capital of the county of Ross in Ohio, on the west bank of the River Scioto, 45 miles south of Columbus. It is beautifully situated in the midst of a rich agricultural district, and has extensive communication by means of the Ohio and Erie canal, and several railway lines. Its public buildings, many of which are an ornament to the town, comprise a large court-house, which cost over \$100,000, fourteen churches, and thirty-six public schools; and among its industrial establishments are carriage-factories, flour and paper mills, an iron foundry, and a manufactory of agricultural implements. Chillicothe was founded in 1796 by immigrants from Virginia and Kentucky, and from 1800 to 1810 it was the capital of the State. Population in 1870, 8920.

CHILLINGWORTH, WILLIAM (1602–1644), a cele-

brated divine and controversialist of the Church of England, was born at Oxford in October 1602. In June 1618 he became a scholar of Trinity College, and after a course of logic and philosophy he was admitted to the degree of Master of Arts in 1623, and was made a fellow of Trinity College in June 1628. In those days he industriously cultivated the art of disputation, as was the fashion among the young theologians of the university. He also excelled in mathematics, and gained some credit as a writer of verses. The controversy between the Church of England and that of Rome was the absorbing topic of the time, which had gained a deeper interest in consequence of the marriage of Charles with Henriette of France. Missionaries of the Church of Rome were busy throughout the country. The Jesuits made the universities their special point of attack; and one, named Fisher, who had his sphere at Oxford, succeeded in making a convert of young Chillingworth. To secure his conquest, Fisher prevailed upon Chillingworth to go to the Jesuit college at Douay. While he was there, Laud, who was his godfather, and who then was bishop of London, pressed him with arguments against the doctrine and practice of the Church of Rome, which had the effect of determining him to make an impartial inquiry into the claims of the two churches. For this purpose he quitted Douay in 1631 after a brief stay there, returned to England, and at Oxford, of which Laud was chancellor, he devoted his energies to a free inquiry into religion. On grounds of Scripture and reason he at length declared for Protestantism, and wrote in 1634, but did not publish, a confutation of the motives which had led him over to Rome. This paper was lost; the other, on the same subject, was probably written on some other occasion at the request of his friends. His return to Protestantism was attended with some scruples, which he expressed in a letter to Dr Sheldon, and which probably gave rise to the report that he had turned papist a second time, and then Protestant again. The extreme sensitiveness of his theological conscience was evinced by the grounds on which he refused a preferment offered to him in 1635 by Sir Thomas Coventry, Lord Keeper of the Great Seal. He was in difficulty about subscribing the Thirty-nine Articles. As he informed Dr Sheldon in a letter, he was fully resolved on two points—that to say the Fourth Commandment is a law of God appertaining to Christians is false and unlawful, and that the damning clauses in St Athanasius's Creed are most false, and in a high degree presumptuous and schismatical. To subscribe, therefore, he felt would be to "subscribe his own damnation." At this time his principal work was far towards completion. It was undertaken in defence of Dr Christopher Potter, parson of Queen's College in Oxford, who had for some time been carrying on a controversy with a Jesuit known as Edward Knott, but whose real name was Matthias Wilson.

Laud, now archbishop of Canterbury, was not a little solicitous about Chillingworth's reply to Knott, and at his request, as "the young man had given cause why a more watchful eye should be held over him and his writings," it was examined by the vice-chancellor of Oxford, and two professors of divinity, and published with their approbation in 1637, with the title *The Religion of Protestants a Safe Way to Salvation*. The work was well received, two editions being published within less than five months; and it called forth a shower of pamphlets from the opposite side. In the preface Chillingworth expresses a totally different view about subscription to the articles. "For the Church of England," he there says, "I am persuaded that the constant doctrine of it is so pure and orthodox, that whosoever believes it, and lives according to it, undoubtedly he shall be saved, and that there is no error in it which may necessitate or warrant any man to disturb

the peace or renounce the communion of it. This, in my opinion, is all intended by subscription." His scruples having thus been happily overcome, he was, in the following year (1638), promoted to the chancellorship of the church of Sarum, with the probend of Brixworth in Northamptonshire annexed to it. He was in the king's army at the siege of Gloucester, and invented certain engines for assaulting the town. Shortly afterwards he accompanied Lord Hopton, general of the king's troops in the west, in his march; and being laid up with illness at Arundel Castle, he was there taken prisoner by the Parliamentary forces under Sir William Waller. As he was unable to go to London with the garrison, he was conveyed to Chichester, and died there in January 1644. His last days were spent in controversy with a redoubtable preacher, Francis Chyennell, about the dispute between the king and the parliament.

Besides his principal work, Chillingworth wrote a number of minor pieces of a controversial kind, and some of his sermons have been preserved. In politics he was a zealous Royalist, asserting that even the unjust and tyrannous violence of princes may not be resisted, although it might be avoided in terms of our Saviour's direction, "when they persecute you in one city, flee into another." His writings long enjoyed a high popularity. The *Religion of Protestants* is characterized by much fairness and acuteness of argument, and was commended by Locke as a discipline of "perspicuity and the way of right reasoning." The charge of Socinianism was frequently brought against him, but, as Tillotson thought, "for no other cause but his worthy and successful attempts to make the Christian religion reasonable." His creed, and the whole gist of his argument, is expressed in a single sentence, which is not without significance even for the present time,—“I am fully assured that God does not, and therefore that men ought not to require any more of any man than this, to believe the Scripture to be God's word, to endeavour to find the true sense of it, and to live according to it.”

CHILMAREE (in Hindustani, *Chalamari*), a town of British India, in the presidency of Bengal, about 35 miles south-east of Rungpur, on the right bank of the Brahmaputra. It is mainly remarkable as the seat of a great religious and commercial festival, which brings together no fewer than 60,000 to 100,000 people.

CHILOE, an island off the coast of Chili, separated from the mainland on the N. by the narrow strait of Chacao, and on the E. by the archipelago of the Gulf of Ancond and Corcovado Bay. It is situated between 41° 45' and 43° 30' S. lat., and extends in length about 120 miles from N. to S.; its greatest breadth is about 50 miles, and its total area is estimated at 5200 square miles. The western or seaward coast is for the most part steep, and in some places rises to a height of 3000 feet; the eastern contrasts with it not only in its smaller elevation but also in the extreme irregularity of its outline. There are several lakes in the southern portion of the island, of which the most extensive bears the name of Lago de Chacao. The interior is mountainous and but partially explored. The whole island is divided into the five departments of Ancond or San Carlos, Chacao, Dalcahue, Castro, and Chonehi. Ancond, the capital and the bishop's seat, is a regularly-built town, with a population of 7000. The total population of the province amounted in 1875 to 64,536. In 1558 the island and the neighbouring archipelago were discovered by Garcia de Mendoza, and not long afterwards were taken possession of by Spain. On the expulsion of the Spanish forces from the rest of Chili in 1818 they settled in Chiloe; but in 1826 the island likewise was abandoned, and since that period it has formed one of the Chilean provinces. The most valuable article of commerce is the timber of the

Chilian cedar, the *Fitzroya patagonica*, which is exported in small planks. The next article in importance is the potato, which is indigenous, and which is produced in annually increasing quantities as land is cleared of forest. Signs of coal-beds of considerable size and value have been discovered in the island. See CHILI.

CHILON, one of the seven sages of Greece, was a Lacedæmonian by birth. His father's name was Damagetos, and he appears to have flourished about the beginning of the 6th century B.C. In 556 B.C. he acted as ephor eponymous, but little more is known of his life. He is said to have died of joy on hearing that his son had gained a prize at the Olympic games. Diogenes Laertius tells us that he composed elegies, but none of these are extant. Many of his apophthegms have been handed down. They show much of the weight and brevity that might be expected in a Spartan, but are not so pointed and severe as those of Bias. According to Chilon the great virtue of man was prudence, or well grounded judgment as to future events. (Diog. Laer., i. §§ 68-73; Mullach, *Frag. Phil. Græc.*, i.).

CHILTERN HILLS, a range of chalk hills in England, extending through part of Oxford, Buckingham, and Bedford, and attaining their highest elevation of 904 feet in the neighbourhood of Wendover. At one time the Chilterns were thickly covered with a forest of beech, and the western district of Bernwood was only cleared by James I. The depredations of the bandits, who found shelter within their recesses, became at an early period so alarming that a special officer, known as the Steward of the Chiltern Hundreds, was appointed for the protection of the inhabitants of the neighbouring districts. The necessity for such an appointment has disappeared long ago, but the three hundreds of Stoke, Burnham, and Desborough in Buckingham are still distinguished by the old name, and a steward is still nominated by the Chancellor of the Exchequer, with a salary of 20s. and the fees of the office. The sole importance of the sinecure consists in the fact that its acceptance enables a member of the House of Commons

to resign his seat, on the plea that he holds a place of honour and profit under the Crown. This appropriation of the post only dates from the middle of the 18th century, and its intrinsic legality has been called in question; but the custom is now completely legitimated by a long line of precedents. An application for the Stewardship of the Chiltern Hundreds was once refused, in 1842.

CHIMÆRA, in Grecian fable, a monster resembling a lion in the fore part, a goat in the middle, and a dragon behind, and having three heads corresponding to the three parts of her body. Each mouth breathed forth fire, and she committed great ravages throughout Caria and Lycia, till she was overthrown by Bellerophon, mounted on the winged horse Pegasus. Some have supposed that the myth owed its origin to the volcanic mountain Chimæra, in Lycia, where works have been found containing representations of the lion. In modern art, the Chimæra is usually represented as a lion, out of the back of which grow the neck and head of a goat. As a general term chimæra signifies any fiction of the imagination made up of incongruous elements, or, generally, any fantastic idea or impracticable scheme of action.

CHIMAY, a town of Belgium, in the province of Hainault, on the Eau blanche, or White Water, about 28 miles south of Charleroi. It contains 3000 inhabitants, and has ironworks, marble quarries, breweries, and potteries. In 1470 it was raised to the rank of a countship by Charles the Bold, and in 1486 was erected into a principality in favour of Charles of Croy. Since that date it has passed in 1686 to the counts of Bossu, and in 1804 to the French family of Riquet de Caraman. In 1805 Prince Francis Joseph Philippe married the daughter of the Spanish minister Cabarrus, a woman of great wit and beauty, who had been previously the wife of M. de Fontenay and of Tallien, and had taken an active part in the overthrow of Robespierre. Their son Joseph, born in 1808, is the present possessor of the title, and has held the office of Belgian plenipotentiary.

CHIMPANZEE. See APE, vol. ii. p. 149

CHINA

THE account of this great empire of Eastern Asia may fitly commence with a brief notice, 1st, of China as known to the ancients (the land of *Sinæ* or *Seres*), and, 2d, of China as known to mediæval Europe (*Cathay*).

China as known to the Ancients.

The spacious seat of ancient civilization which we call China has loomed always so large to Western eyes, and has, in spite of the distance, subtended so large an angle of vision, that, at cras far apart, we find it to have been distinguished by different appellations, according as it was reached by the southern sea-route, or by the northern land-route traversing the longitude of Asia.

In the former aspect the name has nearly always been some form of the name *Sin*, *Chin*, *Sinæ*, *China*. In the latter point of view the region in question was known to the ancients as the land of the *Seres*, to the Middle Ages as the empire of *Cathay*.

The name of *Chin* has been supposed (doubtfully) to be derived from the dynasty of *Thsin*, which a little more than two centuries before our era enjoyed a brief but very vigorous existence, uniting all the Chinese provinces under its authority, and extending its conquests far beyond those limits to the south and the west.

The mention of the *Chinas* in ancient Sanskrit literature, both in the laws of Manu and in the *Mahābhārat*, has often been supposed to prove the application of the name

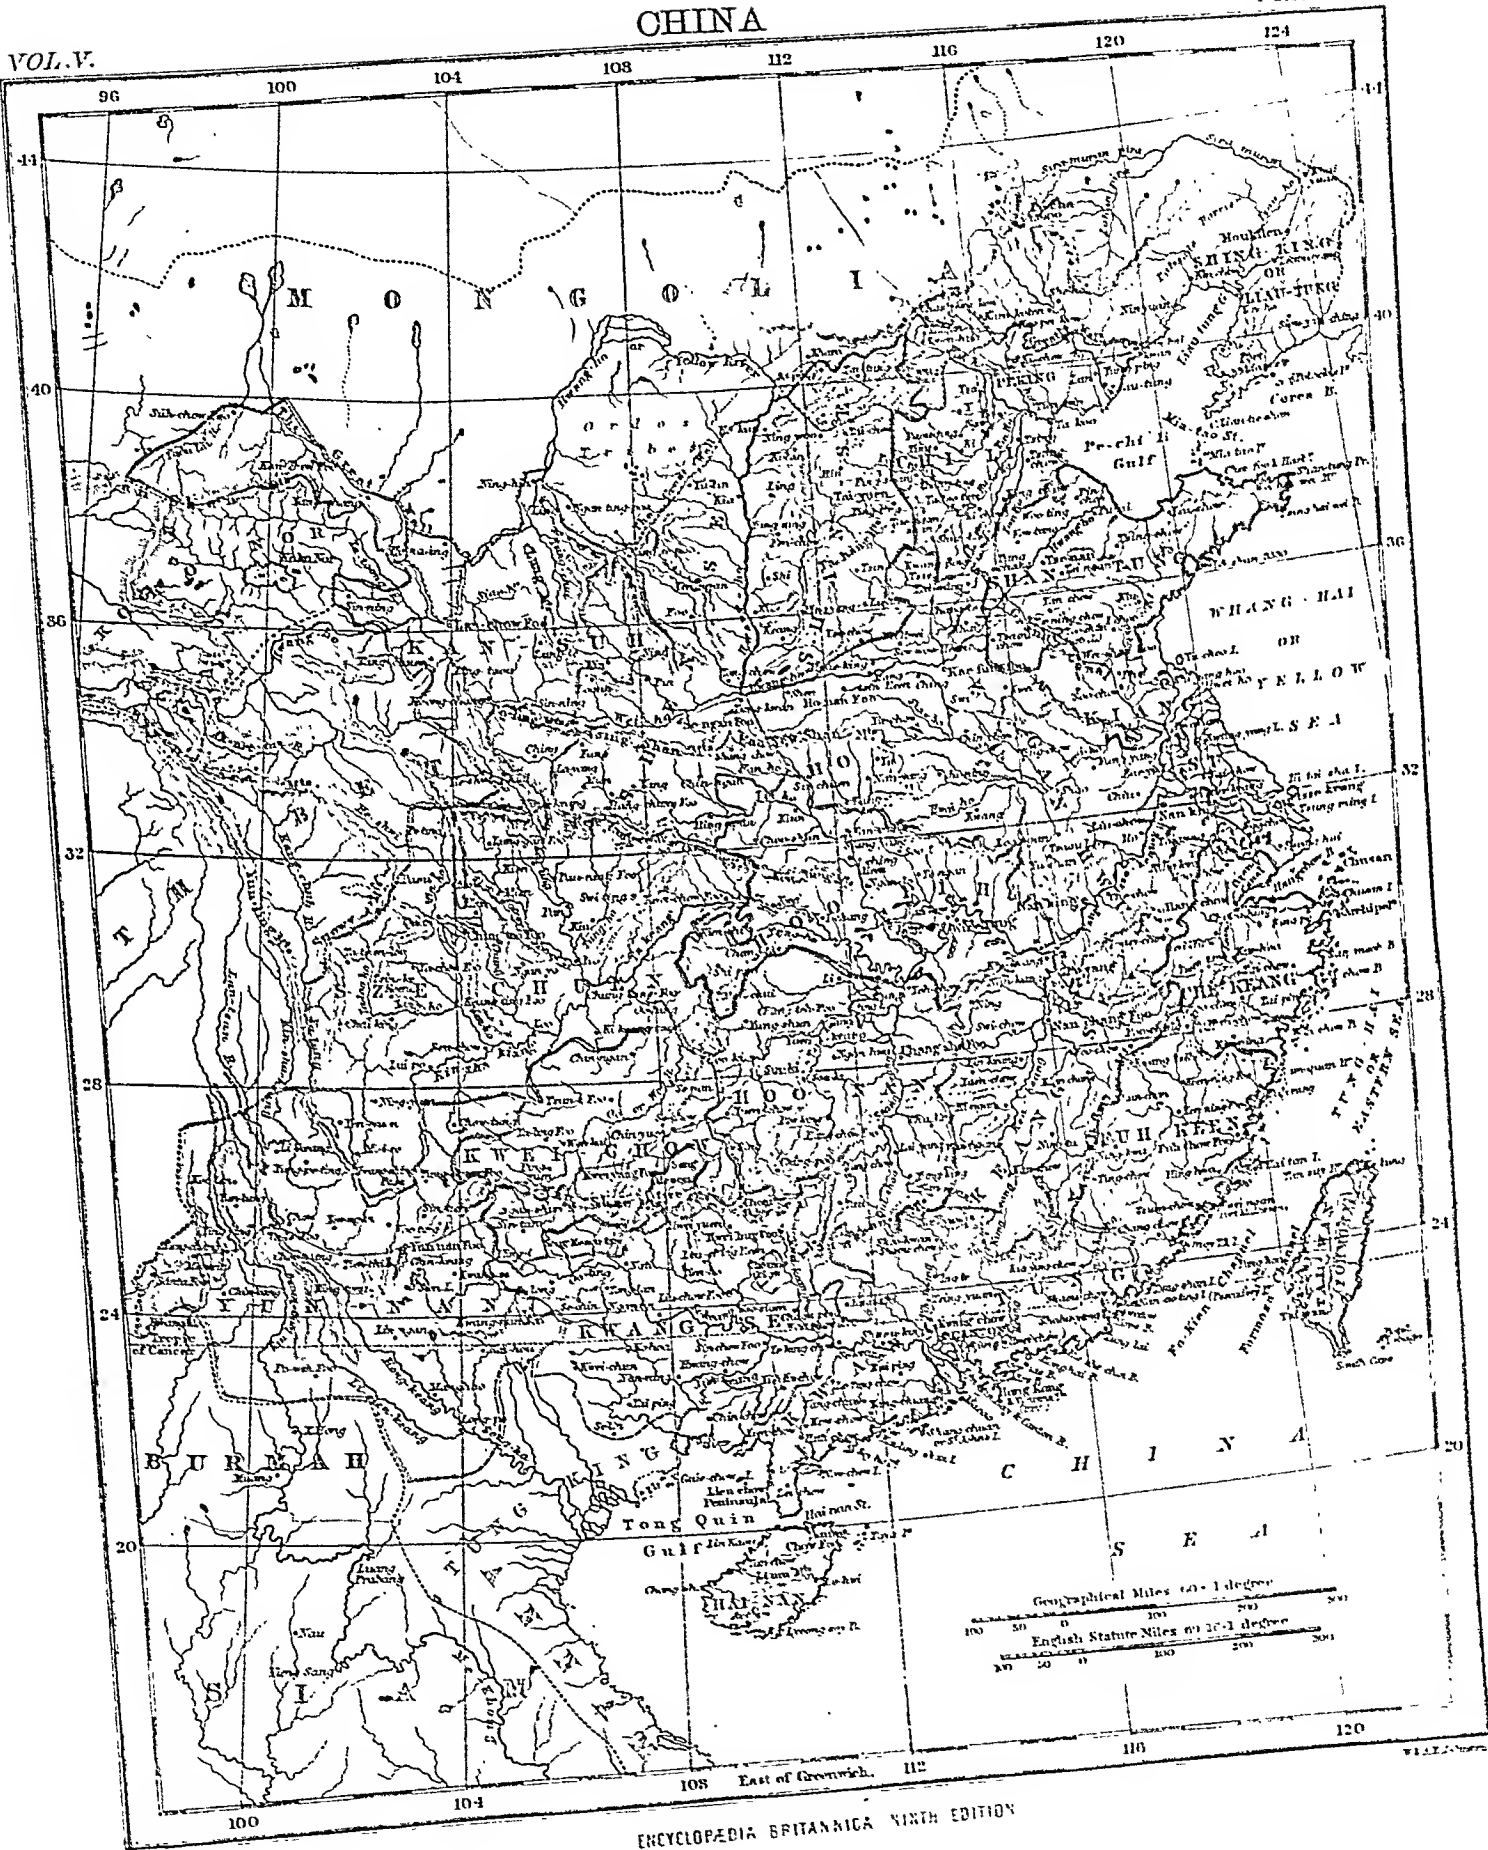

long before the predominance of the *Thsin* dynasty. But the coupling of that name with the *Daradas*, still surviving as the people of Dardistan, on the Indus, suggests it as more probable that those *Chinas* were a kindred race of mountaineers, whose name as *Shinas* in fact likewise remains applied to a branch of the Dard races. Whether the *Sinim* of the prophet Isaiah should be interpreted of the Chinese is probably not at present susceptible of any decision; by the context it appears certainly to indicate a people of the extreme east or south.

The name probably came to Europe through the Arabs, who made the *China* of the further east into *Sin*, and perhaps sometimes into *Thin*. Hence the *Thin* of the author of the *Periplus of the Erythræan Sea*, who appears to be the first extant writer to employ the name in this form (i.e., assuming Müller's view that he belongs to the 1st century); hence also the *Sinæ* and *Thinæ* of Claudius Ptolemy.

It has often indeed been denied that the *Sinæ* of Ptolemy really represented the Chinese. But if we compare the statement of Marcianus of Heraclea (a mere condenser of Ptolemy), when he tells us that the "nations of the *Sinæ* lie at the extremity of the habitable world, and adjoin the eastern *Terra Incognita*," with that of Cosmas, who says, in speaking of *Tzinista*, a name of which no one can question the application to China, that "beyond this there is neither habitation nor navigation,"—we cannot doubt the same region to be meant by both. The funda-

CHINA

VOL. V.

mental error of Ptolemy's conception of the Indian Sea as a closed basin rendered it impossible but that he should misplace the Chinese coast. But considering that the name of *Sin* has come down among the Arabs from time immemorial as applied to the Chinese, considering that in the work of Ptolemy this name certainly represented the furthest known East, and considering how inaccurate are Ptolemy's configurations and longitudes much nearer home, it seems almost as reasonable to deny the identity of his India with ours as to deny that his *Sinæ* were Chinese.

If we now turn to the *Seres* we find this name mentioned by classic authors much more frequently and at an earlier date, for the passages of Eratosthenes (in Strabo), formerly supposed to speak of a parallel passing through *Thiæ*—*διὰ Θιῶν*, are now known to read correctly *δι' Ἀθρῶν*. The name *Seres* indeed is familiar to the Latin poets of the Augustan age, but always in a vague way, and usually with a general reference to Central Asia and the further East. We find, however, that the first endeavours to assign more accurately the position of this people, which are those of Mela and Pliny, gravitate distinctly towards China in its northern aspect as the true idea involved. Thus Mela describes the remotest east of Asia as occupied by the three races (proceeding from south to north), Indians, *Seres*, and *Seyths*; just as in a general way we might say still that Eastern Asia is occupied by the Indies, China, and Tartary.

Ptolemy first uses the names of *Sera* and *Serieæ*, the former for the chief city, the latter for the country of the *Seres*, and as usual defines their position with a precision far beyond what his knowledge justified,—the necessary result of his system. Yet even his definition of *Serieæ* is most consistent with the view that this name indicated the Chinese empire in its northern aspect, for he carries it eastward to the 180th degree of longitude, which is also, according to his calculation, in a lower latitude the eastern boundary of the *Sinæ*.

Ammianus Marcellinus devotes some paragraphs to a description of the *Seres* and their country, one passage of which is startling at first sight in its seeming allusion to the Great Wall, and in this sense it has been rashly interpreted by Lassen and by Reinand. But Ammianus is merely converting Ptolemy's dry tables into fine writing, and speaks only of an encircling rampart of mountains within which the spacious and happy valley of the *Seres* lies. It is true that Ptolemy makes his *Serieæ* extend westward to Imaus, i.e., to Pamir. But the Chinese empire *did* so extend at that epoch, as it did twenty years ago, and we find Lieut. John Wood in 1838 speaking of "*China*" as lying immediately beyond Pamir, just as the Arabs of the 8th century spoke of the country beyond the Jaxartes as "*Sin*," and as Ptolemy spoke of "*Serieæ*" as immediately beyond Imaus.

If we turn into one the ancient notices of the *Seres* and their country, omitting anomalous statements and manifest fables, the result will be something like the following:—"The region of the *Seres* is a vast and populous country, touching on the east the Ocean and the limits of the habitable world, and extending west to Imaus and the confines of Bactria. The people are civilized, mild, just, and frugal, eschewing collisions with their neighbours, and even shy of close intercourse, but not averse to dispose of their own products, of which raw silk is the staple, but which include also silk-stuffs, fine furs, and iron of remarkable quality." That is manifestly a definition of the Chinese.

That Greek and Roman knowledge of the true position of so remote a nation should at best have been somewhat hazy is nothing wonderful. And it is worthy of note that the view entertained by the ancient Chinese of the Roman

empire and its inhabitants, under the name of *Ta-tsin*, had some striking points of analogy to those views of the Chinese which are indicated in the classical descriptions of the *Seres*. There can be no mistaking the fact that in this case also the great object was within the horizon of vision, yet the details ascribed to it are often far from being true characteristics, being only the accidents of its outer borders.

China as known to Mediæval Europe.

CATHAY is the name by which the Chinese empire was known to mediæval Europe, and is in its original form (*Khitai*) that by which China is still known in Russia, and to most of the nations of Central Asia. West of Russia the name has long ceased to be a geographical expression, but it is associated with a remarkable phase in the history of geography and commerce, of which we purpose under this head to give some account.

The name first became known to Europe in the 13th century, when the vast conquests of Jenghiz and his house drew a new and vivid attention to Asia. For some three centuries previously the northern provinces of China had been detached from indigenous rule, and subject to northern conquerors. The first of these foreign dynasties was of a race called *Khitân*, issuing from the basin of the Sungari River, and supposed (but doubtfully) to have been of the blood of the modern Tunguses. The rule of this race endured for two centuries, and originated the application of the name *Khitâi* or *Khitâi* to Northern China. The dynasty itself, known in Chinese history as *Liao*, or "*Iron*," disappeared from China 1123, but the name remained attached to the territory which they had ruled.

The *Khitân* were displaced by the *Nyâchê* or *Chirchê* race, akin to the modern Manchus who now rule China. These reigned, under the title of *Kim*, or "*Golden*," till Jenghiz and his Mongols invaded them in turn. In 1234 the conquest of the *Kim* empire was completed, and the dynasty extinguished under Okkodai, the son and successor of Jenghiz Khân. Forty years later, in the reign of Kublai, grandson and ablest successor of Jenghiz, the Mongol rule was extended over Southern China (1276), which till then had remained under a native dynasty, the Sung, holding its royal residence in a vast and splendid city, now known as Hang-chow, but then as Ling-nan, or more commonly as *King-se*, i.e., the Court. The southern empire was usually called by the conquerors *Mantzi* (or as some of the old travellers write, *Mangi*), a name which Western Asiatics seem to have identified with *Mâchin* (from the Sanskrit *Mahâchîn*), one of the names by which China was known to the traders from Persian and Arabian ports.

The conquests of Jenghiz and his successors had spread not only over China and the adjoining East, but westward also over all Northern Asia, Persia, Armenia, part of Asia Minor, and Russia, threatening to deluge Christendom. Though the Mongol wave retired, as it seemed almost by an immediate act of Providence, when Europe lay at its feet, it had levelled or covered all political barriers from the frontier of Poland to the Yellow Sea, and when Western Europe recovered from its alarm, Asia lay open, as never before or since, to the inspection of Christendom. Princes, envoys, priests,—half-missionary half-envoy—visited the court of the great Khân in Mongolia; and besides these, the accidents of war, commerce, or opportunity carried a variety of persons from various classes of human life into the depths of Asia. "Tis worthy of the grateful remembrance of all Christian people," says an able missionary friar of the next age (Ricold of Monte Croce), "that just at the time when God sent forth into the Eastern parts of the world the Tartars to slay and to

be slain, He also sent into the West his faithful and blessed servants, Dominic and Francis, to enlighten, instruct, and build up in the faith." Whatever on the whole may be thought of the world's debt to Dominic, it is to the two mendicant orders, but especially to the Franciscans, that we owe a vast amount of information about mediæval Asia, and, among other things, the first mention of *Cathay*. Among the many strangers who reached Mongolia were (1245-47) John de Plano Carpini (see CARPINI) and (1253) William of Rubruk (Rubruquis) in French Flanders, both Franciscan friars of high intelligence, who happily have left behind them reports of their observations.

Carpini, after mentioning the wars of Jenghiz against the *Kitai*, goes on to speak of that people as follows:—"Now these *Kitai* are heathen men, and have a written character of their own. . . . They seem, indeed, to be kindly and polished folks enough. They have no beard, and in character of countenance have a considerable resemblance to the Mongols" [are *Mongoloid*, as our ethnologists would say], "but are not so broad in the face. They have a peculiar language. Their betters as craftsmen in every art practised by man are not to be found in the whole world. Their country is very rich in corn, in wine, in gold and silver, in silk, and in every kind of produce tending to the support of mankind." The notice of Rubruk, shrewder and more graphic, runs thus:—"Further on is Great Cathay, which I take to be the country which was anciently called the Land of the Seres. For the best silk stuffs are still got from them. . . . The sea lies between it and India. Those Cathayans are little fellows, speaking much through the nose, and, as is general with all those Eastern people, their eyes are very narrow. They are first-rate artists in every kind, and their physicians have a thorough knowledge of the virtues of herbs, and an admirable skill in diagnosis by the pulse. . . . The common money of Cathay consists of pieces of cotton-paper, about a palm in length and breadth, upon which certain lines are printed, resembling the seal of Mangu Khán. They do their writing with a pencil, such as painters paint with, and a single character of theirs comprehends several letters, so as to form a whole word." Here we have not only what is probably the first European notice of paper-money, but a *partial* recognition of the peculiarity of Chinese writing, and a perception that puts to shame the perverse boggling of later critics over the identity of these Cathayans with the Seres of classic fame.

But though these travellers saw Cathayans in the bazaars of the Great Khan's camps, the first actual visitors of Cathay itself were the Polo family (see POLO, MARCO), and it is to the book of Marco's recollections mainly that Cathay owed the growing familiarity of its name in Europe during the 14th and 15th centuries. It is, however, a great mistake to suppose, as has often been assumed, that the residence of the Polos in that country remained an isolated fact. They were but the pioneers of a very considerable intercourse, which endured till the decay of the Mongol dynasty in Cathay, *i.e.*, for about half a century.

We have no evidence that either in the 13th or 14th century Cathayans, *i.e.*, Chinese, ever reached Europe, but it is possible that some did, at least, in the former century. For, during the campaigns of Hulaku in Persia (1256-1265), and the reigns of his successors, Chinese engineers were employed on the banks of the Tigris, and Chinese astrologers and physicians could be consulted at Tabriz. Many diplomatic communications passed between the Hulakuid Ilkhans and the princes of Christendom. The former, as the great Khan's liegemen, still received from him their seals of state; and two of their letters which survive in the archives of France exhibit the vermilion impressions of those seals in Chinese characters,—perhaps

affording the earliest specimen of that character which reached Western Europe.

Just as the Polos were reaching their native city (1295), after an absence of quarter of a century, the forerunner of a new series of travellers was entering Southern China by way of the Indian seas. This was John of Monte Corvino, another Franciscan who, already some fifty years of age, was plunging single-handed into that great ocean of Paganism to preach the gospel according to his lights. After years of uphill and solitary toil converts began to multiply; coadjutors joined him. The Papal See became cognizant of the harvest that was being reaped in the far East. It made Friar John Archbishop in Cambaluc (or Peking), with patriarchal authority, and sent him batches of suffragan bishops and preachers of his own order. The Roman Church spread; churches and Minorite houses were established at Cambaluc, at Zayton or Tswan-chow in Fuh-keen, at Yang-chow, and elsewhere; and the missions flourished under the smile of the Great Khan, as the Jesuit missions did for a time under the Manchu emperors three centuries and a half later. Archbishop John was followed to the grave, about 1328, by innumerable multitudes of Pagans and Christians alike. Several of the bishops and friars who served under him have left letters or other memoranda of their experience, *e.g.*, Andrew, bishop of Zayton, John of Cora, afterwards archbishop of Sultania in Persia, and Odoric of Pordenone, whose fame as a pious traveller won from the *vox populi* at his funeral a beatification which the church was fain to seal. The only ecclesiastical narrative regarding Cathay, of which we are aware, subsequent to the time of Archbishop John, is that which has been gathered from the recollections of John de' Marignolli, a Florentine Franciscan, who was sent by Pope Benedict XII. with a mission to the Great Khan, in return for one from that potentate which arrived at Avignon from Cathay in 1338, and who spent four years (1342-46) at the court of Cambaluc as legate of the Holy See. These recollections are found in a singular position, dispersed incoherently over a chronicle of Bohemia which the traveller wrote by order of the emperor Charles IV., whose chaplain he was after his return.

But intercourse during the period in question was not confined to ecclesiastical channels. Commerce also grew up, and flourished for a time even along the vast line that stretches from Genoa and Florence to the marts of Chŭ-keang and Fuh-keen. The record is very fragmentary and imperfect, but many circumstances and incidental notices show how frequently the remote East was reached by European traders in the first half of the 14th century,—a state of things which it is very difficult to realize when we see how all those regions, when reopened to knowledge two centuries later, seemed to be discoveries as new as the empires which, about the same time, Cortes and Pizarro were conquering in the West.

This commercial intercourse probably commenced about 1310-1320. Monte Corvino, writing in 1305, says it was twelve years since he had heard any news from Europe; the only Western stranger who had arrived in all that time being a certain Lombard surgeon (probably one of the *Patarini* who got hard measure at home in those days), who had spread the most incredible blasphemies about the Roman Curia and the order of St. Francis. Yet even on his first entrance to Cathay Friar John had been accompanied by one Master Peter of Lucolongo, whom he describes as a faithful Christian man and a great merchant, and who seems to have remained many years at Peking. The letter of Andrew, bishop of Zayton (1326), quotes the opinion of Genoese merchants at that port regarding a question of exchanges. Odoric, who was in Cathay about 1323-1327, refers for confirmation of the wonders which

he related of the great city of Cansay (i.e., King-sze, *hod*. Hang-chow), to the many persons whom he had met at Venice since his return, who had themselves been witnesses of those marvels. And John Marignolli, some twenty years later, found attached to one of the convents at Zayton, in Fuh-keen, a *fondaco* or factory for the accommodation of the Christian merchants.

But by far the most distinct and notable evidence of the importance and frequency of European trade with Cathay, of which silk and silk goods formed the staple, is to be found in the commercial hand-book (circa 1340) of Francesco Balducci Pegolotti, a clerk and factor of the great Florentine house of the Bardi, which was brought to the ground about that time by its dealings with Edward III. of England. This book, called by its author *Libro di divisamenti di Paesi*, is a sort of trade-guide, devoting successive chapters to the various ports and markets of his time, detailing the nature of imports and exports at each, the duties and exactions, the local customs of business, weights, measures, and money. The first two chapters of this work contain instructions for the merchant proceeding to Cathay; and it is evident, from the terms used, that the road thither was not unfrequently travelled by European merchants, from whom Pegolotti had derived his information. The route which he describes lay by Azoff, Astrakhan, Khiva, Otrar (on the Jaxartes), Almálik (Gulja in Ili), Kan-chow (in Kansuh), and so to Hang-chow and Peking. Particulars are given as to the silver ingots which formed the currency of Tartary, and the paper-money of Cathay. That the ventures on this trade were not insignificant is plain from the example taken by the author to illustrate the question of expenses on the journey, which is that of a merchant investing in goods there to the amount of some £12,000 (i.e., in actual gold value, not as calculated by any fanciful and fallacious equation of values).

Of the same remarkable phase of history that we are here considering we have also a number of notices by Mahometan writers. The establishment of the Mongol dynasty in Persia, by which the Great Khan was acknowledged as lord paramount, led (as we have already noticed in part) to a good deal of intercourse. And some of the Persian historians, writing at Tabriz, under the patronage of the Mongol princes, have told us much about Cathay, especially Rashiduddin, the great minister and historian of the dynasty (died 1318). We have also in the book of the Moorish traveller Ibn Batuta, who visited China about 1347-48, very many curious and in great part true notices, though it is not possible to give credence to the whole of this episode in his extensive travels.

About the time of the traveller first named the throne of the degenerate descendants of Jenghiz began to totter to its fall, and we have no knowledge of any Frank visitor to Cathay in that age later than Marignolli; missions and merchants alike disappear from the field. We hear, indeed, once and again of ecclesiastics despatched from Avignon, but they go forth into the darkness, and are heard of no more. Islam, with all its jealousy and exclusiveness, had recovered its grasp over Central Asia; the Nestorian Christianity which once had prevailed so widely was vanishing, and the new rulers of China reverted to the old national policy, and held the foreigner at arm's length. Night descended upon the further East, covering Cathay with those cities of which the old travellers had told such marvels, Cambaluc and Cansay, Zayton and Chinkulan. And when the veil rose before the Portuguese and Spanish explorers of the 16th century, those names are heard no more. In their stead we have CHINA, Peking, Hangchow, Chindeo, Canton. Not only were the old names forgotten, but the fact that those places had ever been known before was forgotten also. Gradually new missionaries went forth from Rome—Jesuits and Dominicans now; new converts were made, and new vicariats constituted; but the old Christian churches, and the Nestorianism with which they had battled, had alike been swallowed up in the ocean of Pagan indifference. In time a wreck or two floated to the surface,—a MS. Latin Bible or a piece of Catholic sculpture; and when the intelligent missionaries called Marco Polo to mind, and studied his story, one and another became convinced that Cathay and China were one.

But for a long time all but a sagacious few continued to regard Cathay as a region distinct from any of the new-found Indies; whilst mapmakers, well on into the 17th century, continued to represent it as a great country lying entirely to the north of China, and stretching to the Arctic Sea.

It was Cathay, with its outlying island of Zipangu (Japan), that Columbus sought to reach by sailing westward, penetrated as he was by his intense conviction of the smallness of the earth, and of the vast extension of Asia eastward; and to the day of his death he was full of the imagination of the proximity of the domain of the Great Khan to the islands and coasts which he had discovered. And such imaginations are curiously embodied in some of the maps of the early 16th century, which intermingle on the same coast-line the new discoveries from Labrador to Brazil with the provinces and rivers of Marco Polo's Cathay.

Cathay had been the aim of the first voyage of the Cabots in 1496, and it continued to be the object of many adventurous voyages by English and Hollanders to the N.W. and N.E. till far on in the 16th century. At least one memorable land-journey also was made by Englishmen, of which the exploration of a trade-route to Cathay was a chief object,—that in which Anthony Jenkinson and the two Johnsons reached Bokhara by way of Russia in 1558-1559. The country of which they collected notices at that city was still known to them only as *Cathay*, and its great capital only as *Cambaluc*.

Cathay as a supposed separate entity may be considered to come to an end with the journey of Benedict Goës, the lay-Jesuit. This admirable person was, in 1603, despatched through Central Asia by his superiors in India with the specific object of determining whether the Cathay of old European writers, and of modern Mahometans, was or was not a distinct region from that China of which parallel marvels had now for some time been recounted. Benedict, as one of his brethren pronounced his epitaph, "seeking Cathay found Heaven." He died at Suhechow, the frontier city of China, but not before he had ascertained that China and Cathay were the same. After the publication of the narrative of his journey (in the *Expedition Christiana apud Sinas* of Trigault, 1615) inexcusable ignorance alone could continue to distinguish between them, and though such ignorance lingered many years longer, the result of his exploration fitly brings this prefatory notice to a close. (H. Y.)

General Description of China Proper.

China, as the name is at present used, embraces within its boundaries the dependencies of Manchuria, Mongolia, and Tibet, in addition to China Proper. This vast empire extends from 18° 30' to 53° 25' N. lat. and from 80° to 130° E. long. It is bounded on the N. by Asiatic Russia along a frontier extending nearly 3000 miles; on the E. by those portions of the Pacific Ocean which are known in the north as the Sea of Japan, in the central portion as the Yellow Sea, and in the south as the China Sea; on the S. and S.W. by the China Sea, Cochin China, and Burmah; and on the W. by Kashmir and Eastern Turkestan, which province has within the last few years been wrested from China by the Ataligh Ghazee.

Table of Provinces, with Area and Population.

Province.	Area in square miles.	Population.
Chih-li	58,049	27,000,000
Shan-tung	65,104	30,000,000
Shan-se	53,268	14,004,210
Ho-nan	65,404	23,037,171
Keang-soo	45,000	37,843,501
Gan-hwuy	48,461	34,108,059
Keang-se	72,176	19,000,000
Ché-keang	36,000	21,000,000
Fuh-keen	53,480	14,777,410
Hoo-pih	70,450	27,370,098
Hoo-nan	84,000	18,652,507
Shen-se	67,400	10,000,000
Kan-suh	86,688	15,193,125
Sze-chuen	220,000	35,000,000
Kwang-tung	79,456	19,174,030
Kwang-se	78,250	7,313,895
Kwei-chow	64,554	5,288,219
Yun-nan	107,969	5,561,320
Shing-king	43,000	6,000,000
Total	1,399,609	370,323,545

The area of China Proper is not more than half that of the whole empire; it extends as far north only as 41° lat., and as far west as 98° long. It is about 1474 miles in length, and its breadth is about 1355 miles. Its coast line measures about 2500 miles; its land frontier is described as being 4400 miles in length, and its area is said to contain 1,399,609 square miles.

Great delta plain.

Surface.—One of the most noticeable features in the surface of China is the immense delta plain in the north-eastern portion of the empire, which, curving round the mountainous districts of *Shan-tung*, extends for about 700 miles in a southerly direction from the neighbourhood of *Peking*, and varies from 150 to 500 miles in breadth. Commencing in the prefecture of *Yung-ping Foo*, in the province of *Chih-li*, its outer limit passes in a westerly direction as far as *Chang-ping Chow*, north-west of *Peking*. Thence running a south-south-westerly course it passes westward of *Ching-ting Foo* and *Kwang-ping Foo* till it reaches the upper waters of the *Wei River* in *Ho-nan*. From this point it turns westward and crosses the *Hwang-ho*, or Yellow River, in the prefecture of *Hwai-king*. Leaving this river it takes a course a little to the east of south, and passing west of *Joo-ning Foo*, in the province of *Ho-nan*, it turns in a more easterly direction as far as *Leuchow Foo*. From this prefecture an arm of the plain, in which lies the *Tsau Lake*, stretches southward from the *Hwai River* to the *Yang-tze Keang*, and trending eastward occupies the region between the river and *Hang-chow Bay*. To the north of this arm rises a hilly district, in the centre of which stands *Nanking*.

The boundary of the plain round the mountainous region of *Shan-tung* begins at *Lai-chow Foo*, and describes a huge bow to the west and south, reaching westward to the prefecture of *Tse-nan*, and southward to the frontier of the province of *Keang-soo*, which boundary it follows to the sea. The greater part of this vast plain descends very gently towards the sea, and is generally below the level of the Yellow River,—hence the disastrous inundations which so often accompany the rise of the *Hwang-ho*. It is the delta of the Yellow River, and also to some extent of the *Yang-tze Keang*, and it is chiefly remarkable for its semi-annular shape, within which it encloses the mountain districts of the province of *Shan-tung*. Owing to the great quantity of soil which is brought down by the waters of the Yellow River, and to the absence of oceanic currents, this delta is rapidly increasing and the adjoining seas are as rapidly becoming shallower. As an instance, it is said that the town of *Pootai* was 1 le west of the sea-shore, in the year 220 B.C., and in 1730 it was 140 le inland, thus giving a yearly encroachment on the sea of about 100 feet. Again, *Seen-shawy Kow* on the *Peiho* was on the sea-shore in 500 A.D., and it is now about 18 miles inland.

Mountain ranges.

The rest of the empire may be described as being either mountainous or hilly. Several ranges of high mountains, in connection with the mountain system of Central Asia, enter the western provinces of the empire, and after traversing the western and southern provinces in various directions dwindle down to low hills as they approach the sea-coast. In the eastern portion of Tibet the *Kwan-lun* range throws off a number of branches, which spread first of all in a south-easterly direction, and eventually take a north and south course, partly in the provinces of *Sze-chuen* and *Yun-nan*, where they divide the beds of the rivers which flow into Siam and Cochin-China, as well as the principal northern tributaries of the *Yang-tze Keang*. Another range, known as the *Tung-nan*, or *Foo-new Shan*, which appears to be the eastern termination of the great *Kwan-lun* range of Central Asia, and which is said to have several snow-clad peaks, enters China in the southern portion of the province of *Kan-suh*, and stretches in an easterly direction across the

province of *Shen-se* into that of *Ho-nan*, where it finally disappears. This range separates the waters which enter the *Hwang-ho*, or Yellow River, through the *Wei* and the *Lo* from those which flow into the *Yang-tze Keang*, through the *Kia-ling* and the *Han*. Forming the northern frontier of the province of *Sze-chuen* runs the *Kew-lung* or *Po-mung* range, which entering China in 102° long., takes a general course of east as far as 112° long., at about which point it is lost sight of in the province of *Hoo-pih*. In the south the *Nan-shan* ranges, some peaks of which are said to reach above the snow-level, take their rise in *Yun-nan*, and after spreading in a series of ranges over the south and east portions of *Kwang-se* trend in an easterly direction, covering the entire province of *Kwang-tung*. Then turning north-eastward, they occupy the whole area of the provinces of *Fuh-keen*, *Keang-se*, *Chieh-keang*, *Hoo-nan*, and southern *Gan-luwy*, until they reach the *Yang-tze Keang*; which river, from the *Tung-ting Lake* to *Chin-keang Foo*, forms their northern boundary. It is reckoned that this mountain region occupies an area of about 300,000 square miles. Besides these more important ranges there are the *Lang Mountains* in *Kan-suh*, the *Ta-hang Mountains* in *Shan-se*, the *Tae Mountains* in *Shan-tung*, and many others, among which may be mentioned the ranges which form the northern frontier of *Chih-li*. It will thus be seen that there is a general subsidence from the mountain districts in the western portions of the empire to the central and south-eastern provinces, where the mountains dwindle down to hills, and where the snowy peaks and rugged sides of the ranges in *Yun-nan* and *Sze-chuen* are exchanged for the wooded tops and carefully-cultivated terraces of the littoral provinces.

Rivers.—The rivers of China are very numerous, and, with the canals, form some of the most frequented highways in the empire. The two largest are the *Yang-tze Keang* and the *Hwang-ho*, or Yellow River, the latter of which is less known to fame for its value in a commercial sense, than by reason of the vast and destructive floods which have from time to time caused it to inundate the low-lying country on either side of its banks. According to Chinese geographers the *Hwang-ho* takes its rise in the "Sea of Stars," on the eastern side of the *Bayen-kara Mountains*, in the Mongolian province of *Kokonor*, where it has gained for itself the name of *Ah-urh-tan*, or Golden River, from the colour of its waters. For some miles it runs in two streams, and when united takes at first a south-easterly course. Next trending in a north-easterly direction it traverses the province of *Kan-suh* and passes northwards through the Great Wall until it reaches the rising ground in the neighbourhood of the *In-shan*. Thence curving to the south-east and south it re-enters China through the Great Wall and continues its southerly course, forming the boundary between the provinces of *Shen-se* and *Shan-se* as far as *Tung-kwan*. Here it makes a sharp bend and runs nearly due east to *Kai-fung Foo*. In the neighbourhood of this city it enters on the great eastern plain of China, and the alterations which have taken place in its bed between this district and the sea has earned for it the well-deserved title of "the Sorrow of Han." According to the Chinese records this portion of the river has changed its course nine times during the last 2500 years, and has emptied itself into the sea at as many different mouths, the most northerly of which is represented as having been in about 39° lat., or in the neighbourhood of the present mouth of the *Peiho*, and the most southerly being that which existed before the last change in 1851–53, in 34° lat. The breaches that were made in the northern bank of the river east of *Kai-fung Foo* during the floods of 1851, 1852, and 1853 caused its waters gradually to overflow the low-lying country to the northwards; and these, after spread-

ing over a belt of country about 12 miles in width, struck the bed of the *Tai-sing River*, and having forced their way into that narrow, clean cut channel, followed it to the sea. The result of this change has been that the old course of the river is dry, and that the muddy dun-coloured waters—hence the name *Huang-ho*, or Yellow River—after permanently flooding a large tract of country, are now leading up to another grand catastrophe by destroying the banks of the new channel which they have found for themselves. Already the increased volume of water has added another obstruction to those before existing to the navigation of the river by destroying a large stone bridge of seven arches at *Tse-hoheon*, a town situated 210 miles from the mouth, the ruins of which have seriously impeded the course of the stream. But the *Huang-ho* is of little value for navigating purposes. At its mouth lies a bar having at its deepest part about from 7 to 9 feet of water only; further up, about 3 miles below *Tse-hoheon*, there is a shoal extending right across its bed, at the deepest point of which there is about 11 feet of water, while in the passage at the extremity of the smoken bridge at *Tse-hoheon* there is a depth of only about 5 feet.

A far more valuable river in every way is the *Yang-tze Keang*, which takes its rise in the Min Mountains of Tibet, and after a course of 2900 miles empties itself into the Yellow Sea in about 31° lat. In common with most of the large rivers of China, the *Yang-tze Keang* is known by various names in different parts of its course. From its source in Tibet to *Sen-chow Foo* in *Sze-chuen*, it bears the name of *Kin-sha Keang*, or River of the Golden Sands. From *Sen-chow Foo* to *Yang-chow Foo* in *Keang-soo*, its volume has gained for it the title of *Tu Keang*, or the Great River; and from the ancient name of the district through which it thence passes, it is known for the remainder of its course as the *Yang-tze Keang*, or the *Yang-tze River*. Chinese geographers state that it has two sources, the more northerly of which gives birth to the *Kang-chuh ah-lin* at a point about 1600 lo in the south-east of the source of the Yellow River; and to the more southerly one of the two the *Na-ko-to-moo-tsing ah-lin*, which rises on the south of the range, owes its existence. Both these streams twist and turn eastward for upwards of 200 lo, when they unite and form one stream, which flows in an easterly and afterwards southerly course until it enters the Chinese province of *Yun-nan* at the *Huang-shing Pass*, or Pass of Imperial Victory. It then turns northward into the province of *Sze-chuen*, and thence after receiving several important tributaries it takes an east-north-easterly course, until passing into *Hoo-pih* it dips southwards to the boundary of *Hoo-nan* in the neighbourhood of the *Tung-ting Lake*, the waters of which contribute largely to swell its volume. From this point it makes a curve northwards as far as *Han-kow*, receiving on the way the waters of the *Han River*. From *Han-kow* it bends its course again southwards to the *Po-pang Lake*. Thence through the province of *Gan-shuy* it proceeds in a north-easterly direction until it reaches *Nanking*, 200 miles from the sea. Here the influence of the tide begins to be felt, and beyond this point it gradually widens into the great estuary by which it is connected with the ocean. The basin area of the *Yang-tze Keang* is reckoned to be about 518,000 square miles, and it is navigable for steamers as far as *Tchang*, upwards of 1200 miles from its mouth. Unlike the Yellow River, along the navigable portion of the *Yang-tze Keang* are dotted many rich and populous cities, among which the chief are *Nanking*, *Gan-king*, *Kew-keang*, *Han-kow*, and *Tchang*. Beyond this last-named city the navigation becomes impossible for any but light native craft, by reason of the rapids which occur at

frequent intervals in the deep mountain gorges through which the river runs between *Kwai-chow* and *Tchang*.

Next in importance to the *Yang-tze Keang* as a water ^{Grand} highway is the *Yun-ho*, or, as it is generally known in ^{Canal} Europe, the *Grand Canal*. This magnificent artificial river reaches from *Hang-chow Foo* in the province of *Ché-keung* to *Tien-tsin* in *Chih-li*, where it unites with the *Peiho*, and thus may be said to extend to *Tung-chow* in the neighbourhood of *Peking*. After leaving *Hang-chow* it passes round the eastern border of the *Tai-hoo*, or Great Lake, surrounding in its course the beautiful city of *Soo-chow*, and then trends in a generally north-westerly direction through the fertile districts of *Keang-soo* as far as *Chin-keang* on the *Yang-tze Keang*. Mr Noy Blins, who in 1868 travelled along the Grand Canal from *Chin-keang* to the new course of the Yellow River, thus describes the characteristics of this portion of its course:—

The Grand Canal between *Chin-keang* and *Tsin-keang-pu*, or in other words, between the *Yang-tze* and the old bed of the Yellow River, . . . is everywhere in good repair, and the adjacent country well irrigated, and apparently in a thriving state, both as regards cultivation, and, to judge by the aspect of the towns on and near its banks, as regards trade also. After crossing the old Yellow River, however, a part of the canal somewhat less known is reached, and the flourishing condition of the country is no longer noticeable; on the contrary, for a distance of about 150 miles, though the canal itself is in tolerably good working order, the country in its vicinity has an arid, sterile appearance, and is but thinly populated. There are few towns or villages, and some there are seem neither populous nor busy, though they are not in ruins, and bear but few traces of the rebellion. . . . The canal, which at one time was so deep that at many places the level of the water was above that of the adjacent country, is now everywhere considerably below it, rendering irrigation at even a short distance from its banks, without mechanical appliances, almost an impossibility; even the dry bed of the *Loma Lake* is scarcely cultivated on account of its elevation above the level of the canal, though it is only separated from it in some parts by a bank of a few yards in width. It is true that this lake appears never to have been more than a shallow flood lagoon, nevertheless it was some feet below the general level of the country, and was connected with the canal by means of water-courses and sluice gates; and if this is difficult to irrigate how much more so must be the country above and beyond it. This 150 miles being passed over, the *W'it Shan* (sometimes called *Yit Shan*) Lake is reached at a small village, called *Han-chuang-cha*. This is the most southern of a chain of lakes or rather lagoons, which stretch from far to the south of *Han-chuang-cha* (I believe from near *Sa-chau-fu* on the old Yellow River) to within a few miles of *Tse-ning-chow*, and which constitute the only important feeder of the Grand Canal to the southward. In the summer they merge one into the other, and form a continuous sheet of water, though very shallow in parts. In winter, when the water is low, these shallow parts are mere morasses, which divide the sheet into three or four separate lagoons. In former days the canal ran in some places by the side of these lagoons, and in others through portions of them, but being everywhere embanked on both sides, it was only dependent upon them for its supply of water, the canal itself forming an unobstructed means of communication through the year. Of late years, however, this section of the canal has been allowed to go to ruin, and those portions only are used which run through the morasses existing in the dry season, the lagoons themselves forming elsewhere the only channel for navigation. Near the northern limit of these lagoons stands the city of *Tse-ning-chow*, the first place of any importance on the canal north of *Tsin-keang-pu*; it is said to be a place of considerable trade in ordinary times. . . . Still proceeding northward, a distance from *Tse-ning-chow* of about 25 miles, the summit level of the canal is reached near a small town called *Nan Wang*. It is here that the River *Wen* falls into the canal, a portion of its waters flowing to the south, and the rest to the north, precisely as described by Staunton and other writers. . . . About 30 miles beyond *Nan Wang* we come to the new Yellow River, the canal for that distance being extremely narrow and shallow—a mere ditch in fact, running between embankments large enough to confine a stream of infinitely greater volume. The banks along nearly the whole of the Grand Canal between the old and the new bed of the Yellow River, excepting those portions bordering on or traversing the lagoons, are surrounded by earthen walls encircled after the fashion of city walls, behind which are stockades at intervals of every few miles. All this work has the appearance of being recently constructed, though in many places it is already being broken up by the country people to make room for cultivation, for they can ill afford to lose that strip of land immediately adjacent to and irrigated by the canal. The villages

also make an attempt at fortifications, some of them being surrounded by earthen or mud walls or moats; and, indeed, many solitary farms have some species of defensive works round them, and in most cases a small, square brick tower within. These towers are rarely met with to the south of the province of *Shan-tung*—they are probably the “water castles” mentioned by the historian of the Dutch Embassy.

On the west side of the canal, at the point where the Yellow River now cuts across it, there is laid down in Chinese maps of the last century a dry channel which is described as being that of the old Yellow River. Leaving this point the canal passes through a well-wooded and hilly country west of *Tung-ping Chow*, through the city of *Chang-kew Chin* and to the east of *Tung-chang Foo*. At *Lin-tsing Chow* it is joined at right angles by the *Wei River* in the midst of the city, and from thence crosses the frontier into *Chih-li*, and passing to the west of *Tih Chow* and *Tsang Chow* joins the *Peiho* at *Tien-tsin*, after having received the waters of the *Ke-to River* in the neighbourhood of *Tsing Heen*. At *Tien-tsin* the canal ends, and the *Peiho* completes the communication to the vicinity of *Peking*.

Another of the large rivers of China is the *Han Keang*, which rises in the *Po-mung* or *Kew-lung* mountains to the north of the city of *Ning-keang Chow* in *Shen-se*. Taking a generally easterly course from its source as far as *Fan-ching*, it from that point takes a more southerly direction and empties itself into the *Yang-tsze Keang* at *Han-kow*, “the mouth of the Han.” This river has some noticeable peculiarities. Not the least of these is that it is very narrow at its mouth (200 feet) and grows in width as the distance from its mouth increases. Another marked feature is that the summer high-water line is for a great part of its course, from *E-ching Heen* to *Han-kow*, above the level of its banks, the result being that were it not for artificial barriers the whole of the surrounding country would be under water for a great part of the year. In the neighbourhood of *Seen-taou Chin* the elevation of the plain above low-water is no more than 1 foot, and in summer the river rises about 26 feet above its lowest level. To protect themselves against this inevitably recurring danger of inundations the natives have here, as elsewhere, thrown up high embankments on both sides of the river, but at a distance from the natural banks of about 50 to 100 feet. This intervening space is flooded every year, and by the action of the water new layers of sand and soil are deposited every summer, thus strengthening the embankments from season to season. In summer the river would be navigable for steamers of moderate size as far as *Laou-ho Kow*, which is situated 180 le above *Fan-ching*, but in winter it would be quite impossible to reach the latter place. The chief trading places on the *Han-keang* are *Sha-yang Chin*, *Yo-Kow*, *Sin-Kow*, *Seen-taou Chin*, *Fan-ching*, and *Laou-ho Kow*.

In the southern provinces the *Se-keang*, or Western River, is the most considerable. This river takes its rise in the prefecture of *Kwang-nan Foo* in *Yun-nan*, whence it reaches the frontier of *Kwang-se* at a distance of about 90 le from its source. Then trending in a north-easterly direction it forms the boundary between the two provinces for about 150 le. From this point it takes a generally south-easterly course, passing the cities of *Teen Chow*, *Fung-e Chow*, *Shang-lin Heen*, *Lung-gan Heen*, *Yung-kang Chow*, and *Nan-ning Foo* to *Yung-shun Heen*. Here it makes a bend to the north-east, and continues this general direction as far as *Sin-chow Foo*, a distance of 800 le, where it meets and joins the waters of the *Keen Keang* from the north. Its course is then easterly, and after passing *Woo-chow Foo* it crosses the frontier into *Kwang-tung*, and finally empties itself into the China Sea in the neighbourhood of *Macao*. Like the *Yang-tsze Keang* this river is known by

various names in different parts of its course. From its source to *Nan-ning Foo* in *Kwang-se* it is called the *Se-yang Keang*, or River of the Western Ocean; from *Nan-ning Foo* to *Sin-chow Foo* it is known as the *Yuh-keang*, or the Bending River; and over the remainder of its course it is recognized by the name of the *Se-keang* or Western River. The *Se-keang* is navigable as far as *Shaou-king*, 130 miles, for vessels not drawing more than 15 feet of water, and steamers of a light draught might easily reach *Woo-chow Foo*, in *Kwang-se*, which is situated 75 miles further up. In winter the navigation for junks is difficult above *Woo-chow Foo*, and it is said that rapids are met with about 100 miles beyond that city.

The *Peiho* is a river of importance as being the high water-way to *Peking*. Taking its rise in the *Se-shan*, or Western Mountains, beyond *Peking*, it passes the city of *Tung-chow*, the port of *Peking*, and *Tien-tsin*, where it meets the waters of the *Yun-ho*, and empties itself into the Gulf of *Pih-chih-li* at the village of *Takoo*. The *Peiho* is navigable for small steamers as far as *Tien-tsin* during the greater part of the year, but throughout the winter months, that is to say, from the end of November to the beginning of March, it is frozen up.

Lakes.—There are numerous lakes in the central provinces of China. The largest of these is the *Tung-ting Lake* in *Hoo-nan*, which, according to Chinese geographers, is upwards of 800 le, or 266 miles, in circumference. In native gazetteers its various portions are known under distinct names; thus it is said to include the *Tsing-tsaou*, or Green Grass Lake; the *Ung*, or Venerable Lake; the *Chih-sha*, or Red Sand Lake; the *Hwang-yih*, or Imperial Post-house Lake; the *Gan-nan*, or Peaceful Southern Lake; and the *Tu-tung*, or Great Deep Lake. In ancient times it went by the name of the *Kew-keang Hoo*, or Lake of the Nine Rivers, from the fact that nine rivers flowed into it. During the winter and spring the water is so low that the shallow portions become islands, separated by rivers such as the *Scang* and *Yuen*, and numberless streams; but in summer, owing to the rise in the waters of the *Yang-tsze Keang*, the whole basin of the lake is filled. The *Poyang Lake* is also subject to a wide difference between high and low water, but not quite to the same extent as the *Tung-ting Lake*, and its landmarks are more distinctly defined. The *Tai Lake*, in the neighbourhood of *Soo-chow Foo*, is also celebrated for its size and the beauty of its surroundings. It is about 150 miles in circumference, and is dotted over with islands, on which are built temples for the devotees of religion, and summer-houses for the votaries of pleasure from the rich and voluptuous cities of *Hang-chow* and *Soo-chow*. The boundary line between the provinces of *Chih-keang* and *Keang-soo* crosses its blue waters, and its shores are divided among thirteen prefectures. Besides these lakes there are, among others, two in *Yun-nan*, the *Ten-che* near *Yun-nan Foo*, which is 40 miles long and is connected with the *Yang-tsze Keang* by the *Poo-to River*, and the *Urh-hai* to the east of the city of *Ta-le*.

Loess.—One of the most remarkable features in the physical geography of China is the existence of a vast region of loess in the northern portion of the empire. This peculiar formation covers the province of *Chih-li* (with the exception of the alluvial plain), *Shan-se*, northern *Shen-se*, *Kan-suh*, and northern *Hoo-nan*, constituting altogether an area of about 250,000 square miles. Loess is a solid but friable earth of a brownish-yellow colour. It spreads alike over high and low grounds, smoothing off the irregularities of the surface, and is often to be found covering the sub-soil to a depth of more than 1000 feet. It has a tendency to vertical cleavage, and wherever a river cuts into it, the loess encloses it between perpendicular cliffs, in many places 500 feet in height. These when washed by the

water are speedily undermined, and the loess breaks off in vertical sheets, which fall into the river and are carried down by the stream. In this way have been deposited the sediments which to a great extent constitute the great plain, and render the Gulf of *Pih-chih-li* and the Yellow Sea so shallow. From an economical point of view the loess is invaluable to the natives of the north of China. In its perpendicular cliffs which are removed from the action of running water are dug out innumerable caves, in which a large majority of the people inhabiting the loess region dwell, while its surface yields abundant crops, requiring no application of manure and but slight expenditure of labour in preparation. Wherever it is found, therefore, whether on the plain or at an elevation of 7000 or 8000 feet, it is available for agricultural purposes. The Chinese call it *Hwang-too*, or "Yellow Earth," and it has been suggested that the imperial title *Hwang-te*, "Yellow Emperor," or "Ruler of the Yellow," has had its origin in the fact that the emperor was lord of the loess or the "Yellow Earth."

Provinces.—China Proper is divided into nineteen provinces,—*Chih-li*, *Shan-tung*, *Shan-se*, *Ho-nan*, *Keang-soo*, *Gan-luwy*, *Keang-se*, *Ch'keang*, *Fuh-keen*, *Hoo-pih*, *Ho-nan*, *Shen-se*, *Kan-suh*, *Sze-chuen*, *Kwang-tung*, *Kwang-se*, *Kwei-chow*, *Yun-nan*, and *Shing-king* in Manchuria.

The metropolitan province of *Chih-li*, in which is situated *Peking*, the capital of the empire (see *PEKING*), contains eleven prefectural cities, and occupies an area of 58,919 square miles. By the latest census reports the population was returned as 27,000,000. This province forms part of the great delta plain spoken of above, with the exception of the mountain ranges which define its northern and western frontier. It is bounded on the E. by the Gulf of *Pih-chih-li* and *Shan-tung*, and on the S. by *Shan-tung* and *Ho-nan*. The proportion of Mahometans among the population is very large. In *Peking* there are said to be as many as 20,000 Mahometan families, and in *Paou-ting Foo*, the capital of the province, there are about 1000 followers of the Prophet. The extremes of heat and cold in *Chih-li* are very marked, as a glance at the accompanying table of the temperature at *Tien-tsin* during the year 1861, as chronicled by Dr Lamprey's self-registering thermometer, will show.

1861.	Thermometer (Fahr.)		1861.	Thermometer (Fahr.)	
	Maximum.	Minimum.		Maximum.	Minimum.
January	38	0.8	July	108	61
February	46	1.5	August	100	60.5
March	68	18	September ..	92	40
April	87	35	October	77	40
May	94	41	November ..	42	17.5
June	107	53	December ..	50	3

During the months of December, January, and February the rivers are frozen up, and even the Gulf of *Pih-chih-li* is fringed with a broad border of ice. There are four rivers of some importance in the province, namely, the *Pekiho*, which has been described above; the *Wän-ho*, which rises in the mountains in Mongolia, and flowing to the west of *Peking*, forms a junction with the *Pekiho* at *Tien-tsin*; the *Shang-se-ho*, which rises in the mountains on the north of the province of *Shan-se*, and takes a south-easterly course as far as the neighbourhood of *Ki Chow*, from which point it trends north-east, and eventually joins the *Wän-ho* some 15 miles above *Tien-tsin*; the *Poo-to-ho*, which rises in *Shan-se*, and after running a parallel course to the *Shang-se-ho* on the south, empties itself in the same way into the *Wän-ho*; and the *Lan-ho*, which rises in Mongolia, enters the province on the north-east after passing to the west

of *Jehol*, passes the city of *Yung-ping Foo* in its course (which is south-easterly) through *Chih-li*, and from thence winds its way to its mouth at the north-eastern boundary of the Gulf of *Pih-chih-li*. The province contains three lakes of considerable size. The largest is the *Tu-loo-tse Hoo*, which lies in 37° 40' lat. and 115° 20' E. long.; the second in importance is one which is situated to the E. of *Paou-ting Foo*; and the third is the *T'oo-loo-tse Hoo*, which lies E. by N. of *Shun-tih Foo*. Four high roads radiate from *Peking*: one leading to *Urga* by way of *Seuen-hwa Foo*, which passes through the Great Wall at *Chang-kea Kow*; another, which enters Mongolia through the *Koo-pei Kow* to the north-east, and after continuing that course as far as *Pung-ning* turns in a north-westerly direction to *Dolanor*; a third striking due east by way of *Tung-chow* and *Yung-ping Foo* to *Shan-hai Kwan*, the point where the great wall terminates on the coast; and a fourth which trends in a south-westerly direction to *Paou-ting Foo* and on to *Tai-yuen Foo* in *Shan-se*. The mountain ranges to the north of the province abound with coal, notably at *Chai-tang*, *Tai-gan-shan*, *Miaon-gan-ling*, and *Foo-taun* in the *Se-shan* or Western Hills. "At *Chai-tang*," Baron von Richthofen says, "I was surprised to walk over a regular succession of coal-bearing strata, the thickness of which, estimating it step by step as I proceeded gradually from the lowest to the highest strata, exceeds 7000 feet." The coal here is anthracite, as is also that at *Tai-gan-shan*, where are found beds of greater value than any in the neighbourhood of *Peking*. In *Seuen-hwa Foo* coal is also found, but not in such quantities as in the places above named. Iron and silver also exist in small quantities in different parts of the province, and hot and warm springs are very common at the foot of the hills along the northern and western edges of the province. The principal agricultural products are wheat, kaou-leang, oats, millet, maize, pulse, and potatoes. Fruits and vegetables are also grown in large quantities. Of the former the chief kinds are pears, apples, plums, apricots, peaches, persimmons, and melons. *Tien-tsin* is the Treaty Port of the province, and by the *Consular Trade Report* for 1874 we find that the total value of the merchandize exported from that city during the year amounted to 1,144,893 taels, and that of the goods imported to 17,682,684 taels. The articles which figure most conspicuously in the lists of exports are dates, dried lily flowers, wool, tobacco, and rhubarb; and the most valuable of the imports are shirtings, drills, T-cloths, jeans and twills, opium, woollens, steel, lead, needles, Japanese seaweeds, and sugar.

The province of *Shan-tung*, "or East of the Mountains," *Shan-tung* is bounded on the N. by the province of *Chih-li* and the Gulf of *Pih-chih-li*, on the E. by the Yellow Sea, on the S. by *Keang-soo* and the Yellow Sea, and on the W. by *Chih-li*. It contains an area of 65,104 square miles, and the population is estimated to be 30,000,000. It is divided into ten prefectures, with as many prefectural cities, of which *Tse-uan Foo*, the provincial capital, is the chief. The physical features of the province are very plainly marked. The centre and eastern portions are occupied by a series of mountain ranges running north-east and south-west, between which lie fertile valleys, while the north-western, southern, and western portions form part of the great delta plain of the north of China. The most considerable range of mountains is that which lies to the north of the city of *Tai-gan Foo*, of which the highest peak is the *Tai-shan*, a mountain which has been famous in Chinese history for more than 4000 years, and to which at the present day hundreds of pilgrims annually resort. Another important range is the *Laou-shan*, which fringes the south-eastern coast for about 18 miles. With the exception of the Yellow River, which in its new course

traverses the province in a north-easterly direction to the sea, there are no large rivers in *Shan-tung*. The most considerable are the *Wei*, which flows into the Gulf of *Pih-chih-li*; the *Yih*, which empties itself into a lake lying to the east of the Grand Canal; and the *Ta-wan*, which rises at the southern foot of the *Yih Mountains* and terminates its course in the Grand Canal. There are several lakes in the province, notably the *He-shang Hoo* and the *Nan-shang Hoo*, both of which border on the Grand Canal in the south-west. Large quantities of foreign and southern goods are consumed in the populous districts surrounding these lakes, the waters of which afford means of export for the cotton, silk, coal, grain, &c., which are produced in the fertile tracts lying in their neighbourhood. Speaking generally the province is not a fertile one. Not being a loess region, the mountains are unproductive, and yield only brushwood and grass, while the plain to the north is so impregnated with salt that it is almost valueless, especially near the sea, for agricultural purposes. The valleys between the mountains and the plain to the south-west are, however, extremely rich and fertile. The chief wealth of *Shan-tung* consists in its minerals, the principal of which is coal. There are four large coal-fields and several smaller ones now being worked in the province, the most considerable of which lies in the valley of the *Laon-foo River* in the centre of the province. The coal and coke from this district are conveyed by road to the city of *Le-tsing* on the Yellow River, a distance of about 75 miles, from whence they are exported in all directions. Another large field lies on the plain a little to the south of *Yih-chow Foo* in the south. A third field is in the district of *Wei Heen* to the north; and a fourth in the neighbourhood of *Yih Heen* in the south-west. Iron ore, ironstone, gold, galena, lead, and copper are also found in considerable quantities in many parts of the province. The principal agricultural products are wheat, millet, Indian corn, pulse, rice, arrowroot, and many varieties of fruits and vegetables. The castor-oil plant is common, and the wax tree grows plentifully in the neighbourhood of *Zai-yang* in the east, giving rise to a considerable trade in the wax produced by means of the wax insects. Unlike those of their kind in *Sze-chuen*, the wax insects of *Shan-tung* breed and become productive in the same districts. They are placed upon the trees in the spring, and at the close of the summer they void a peculiar substance which when melted forms wax. In the autumn they are taken off the trees, and are preserved within doors until the following spring. *Shan-tung* abounds in good harbours, the most noteworthy of which are *Chefoo* and *Wei-hui-wei* on the north, and *Shih-taou*, *Kin-ke-kow*, and *Ching-taou* on the south of the promontory. As being the native province of both Confucius and Mencius, *Shan-tung* has acquired an undying fame in the Chinese world of literature. *Chefoo*, the Treaty Port of *Shan-tung*, is situated on the north-eastern coast of the province. The value of the foreign trade from this port amounted in 1874 to £2,597,060, £1,882,144 of which represented the imports, and £714,916 the exports.

The province of *Shan-se* is bounded on the N. by Mongolia, on the E. by *Chih-li*, on the S. by *Ho-nan*, and on the W. by *Shen-se*. It occupies an area of 53,268 square miles, and contains besides its capital, *Tae-yuen Foo*, eight prefectural cities. The population is returned as being 14,004,210. The configuration of *Shan-se* is noteworthy, forming, from its southern frontier to as far north as *Ning-woo Foo*—an area of about 30,000 square miles—a plateau elevated from 5000 to 6000 feet above the level of the sea, the whole of which is one vast coal-field. The northern and western limits of the plateau are bounded by high mountain ranges trending south-west and north-

east. Down the central line of the province from north to south lies a curious series of deep depressions, all of which are ancient lake basins. But though forming a series it is plain that these lakes were not formerly connected with each other, some being separated from those next adjoining by high ridges, and being drained by different rivers and in different directions. *Shan-se* is one of the most remarkable coal and iron regions in the world, and Baron von Richthofen gives it as his opinion that the world, at the present rate of consumption of coal, could be supplied for thousands of years from *Shan-se* alone. The neighbourhood of *Tse-chow Foo* in the south of the province abounds in both coal and iron, and has probably, partly by reason of its situation being within reach of the populous plain of *Hwai-king Foo*, of the Yellow River, of *Taou-kow Chin* and *Sen-woo Heen* (the shipping places for *Tien-tsin* and the Grand Canal), and of *Ho-nan Foo*, furnished more iron to the Chinese than any other region of a similar extent in the empire. The iron is of great purity and is easily fusible, while the necessary means for manufacturing it, such as all sorts of clay and sand for crucibles, moulds, &c., and a very superior anthracite coal, lie ready to hand. The coal is of two kinds, bituminous and anthracite, and the line of demarcation between the two is formed by the hills which are the continuation of the *Ho-shan* range, the fields of bituminous coal being on the west of these hills, and those of anthracite on the east. In the neighbourhood of *Ping-ting Chow* the extent of the coal-field is incalculable; and speaking of the whole plateau, Baron von Richthofen says, "These extraordinary conditions, for which I know no parallel on the globe, will eventually give rise to some curious features in mining. It may be predicted that, if a railway should ever be built from the plain to this region—and there is no other means of ever bringing to their due account its mineral resources—branches of it will be constructed within the body of one or other of these beds of anthracite, which are among the thickest and most valuable known anywhere, and continue for miles underneath the hills west of the present coal-belt of *Ping-ting Chow*. Such a tunnel would allow of putting the produce of the various coal-beds immediately on railroad carts destined for distant places." Salt is produced in the prefecture of *Ping-yang* in the south of the province, both from a salt lake and from the alluvial soil in the neighbourhood of the *Fan River*. In agricultural products the province is poor, and as the means of transport at present existing are rude and insufficient, all kinds of food command unusually high prices. Meat is a rare luxury, and salt fish, the usual substitute for meat, is consumed only by the wealthier classes. As a rule the people are poor, and in the mountainous districts are subject to famine and starvation. The only waggon road leading into and through *Shan-se* is the great highway from *Peking* to *Se-gun Foo*, which enters *Shan-se* west of *Ching-ting Foo*, and leaves the province at the *Tung-kwan* at the great bend of the Yellow River.

The province of *Ho-nan* is bounded on the N. partly by the Yellow River (which it crosses to the west of *Ho-nan Foo*, forming an arm northwards between the provinces of *Shan-se* and *Chih-li*), on the W. by *Shen-se*, on the S. by *Hoo-pih*, and on the E. by *Gan-luwy*. It occupies an area of 65,404 square miles, and contains nine prefectural cities. Its capital is *Ho-nan Foo*. The prefecture of *Hwai-king*, north of the Yellow River, consists of a fertile plain, "rendered park-like by numerous plantations of trees and shrubs, among which thick bosquets of bamboo contrast with the gloomy groves of cypress." All kinds of cereals grow luxuriantly, and the general productiveness of the district is indicated by the extreme denseness of the population. The most noticeable feature in that portion

of the province which is properly called *Ho-nan*, or "south of the River," is the *Foo-new Shan* range, which runs east and west across this part of the province. As the *Kuan-lun* range, it forms an almost impassable barrier between Kokonor and Tibet, and in China it separates completely the northern from the central provinces. Coal is found on the south of the Yellow River in the districts of *Ho-nan Foo*, *Lushan*, and *Joo Choo*. The chief products of the province are, however, agricultural, especially in the valley of the *Tang-ho* and *Pe-ho*, which is an extensive and densely populated plain running north and south from the *Foo-new Shan*. Cotton is also grown extensively and forms the principal article of export, and a considerable quantity of wild silk is produced from the *Foo-new Shan*. Three roads from the east and south unite at *Ho-nan Foo*, and one from the west. The southern road leads to *Joo Choo*, where it forks, one branch going to *Sho-ke-chin*, connecting the trade from *Fan-ching*, *Han-kow*, and the *Han River* generally, and the other to *Choo-ke-kow* near the city of *Chin-chow Foo*, at the confluence of the three rivers which unite to form the *Sho-ho*; the second road runs parallel with the Yellow River to *Kai-fung Foo*; the third crosses the Yellow River at *Mang-tsin Heen*, and passes thence in a north-easterly direction to *Hu-king Foo*, *Siu-woo Heen*, and *Wei-hung Foo*, at which place it joins the high road from *Peking* to *Fan-ching*; and the western road follows the southern bank of the Yellow River for 700 *le* to its great bend at the fortified pass known as the *Tung-kwan*, where it unites with the great waggon road leading through *Shan-se* from *Peking* to *Soungan Foo*.

Keang-soo. The province of *Keang-soo* is bounded on the N. by *Shan-tung*, on the S. by *Ché-keang*, on the W. by *Gau-hung*, and on the E. by the sea. It occupies an area of 45,000 square miles, and the population, which is larger than that of any other province of China, is estimated at 37,843,501. *Keang-soo* forms part of the great plain of Northern China. There are no mountains within its limits, and but few hills. It is watered as no other province in China is watered. The Grand Canal runs through it from south to north; the *Yang-tze Keang* crosses its southern portion from west to east; it possesses several lakes, of which the *Tai-hoo* is the most noteworthy, and numberless streams connect the canal with the sea. Its coast is studded with low islands and sand-banks, the results of the deposits brought down by the Yellow River during the different periods in which in the course of its history it has flowed into the Yellow Sea. *Keang-soo* is rich in places of interest. *Nanking*, "the Southern Capital," was the seat of the Chinese court until the commencement of the 15th century, and in modern times it has been famous as having been the headquarters of the *Tai-ping* rebels from the year 1853, when they took the city by assault, to 1864, when its garrison yielded to Col. Gordon's "ever victorious army" (see *NANKING*), and *Han-chow Foo* and *Soo-chow Foo* on the *Tai-hoo*, are reckoned to be the most beautiful cities in China. "Above there is Paradise, below are *Soo* and *Hang*," says the Chinese proverb. Of late years also *Shanghai* has earned for itself a place among the notabilities of the province. Tea and silk are the principal articles of commerce produced in *Keang-soo*, and next in importance are cotton, sugar, and medicines. The silk manufactured in the looms of *Soo-chow* is famous all over the empire, as a proof of which it may be mentioned that, on the occasion of the marriage of the late emperor *Tung-che*, large orders were received by the manufacturers in that city for silken goods to be bestowed as imperial presents and to be converted into wedding garments. In the mountains near *Nanking*, coal, plumbago, iron ore, and marble are found. *Shanghai* on the *Woo-sung River*, and *Chin-keang* on the *Yang-tze Keang*, are the two Treaty

Ports in the province. According to the trade reports for 1874, the value of the goods exported from *Shanghai* in that year amounted to 27,541,834 taels, and that of those imported to 89,636,343 taels. From *Chin-keang* during the same period, £317,277 worth of merchandize was exported, while the value of the imports amounted to £3,527,066. In explanation of this latter figure the British vice-consul writes, "with the exception of opium, the sale of which has steadily advanced since the opening of the port (in 1861), all the principal articles of import exhibit a decline."

The province of *Gau-hung* "Peace and Plenty," is *Gau-hung*. bounded on the N. by *Ho-nan*, on the E. by *Keang-soo* and *Ché-keang*, on the S. by *Keang-se*, and on the W. by *Hoo-pih* and *Ho-nan*. It covers an area of 48,461 square miles, and contains a population of 34,108,059 souls. Its principal city is *Gan-king* on the *Yang-tze Keang*, besides which it numbers seven prefectural cities. The southern half of the province, that portion south of the *Yang-tze Keang*, forms part of the *Nan-shan*, or hilly belt of the south-eastern provinces, and produces, besides cotton and iron ore, large quantities of green tea. *Gau-hung* is one of the most productive provinces of China. Over the whole of its southern portion tea is largely grown, notably in the districts of *Heng-chow Foo*, *Tung-leu*, *Tu-tung*, and *Woo-hoo*. Speaking of this part Baron von Richthofen says, "The exuberant fertility of the soil in the lower portions of the province is not excelled by anything I have seen in temperate climates. No expense has, therefore, been spared in protecting the lowlands by embankments, and introducing a perfect system of irrigation. Both deserve the highest admiration. On the *King River* I have walked for miles through fields of hemp the stalks of which were from 11 to 13 feet high. Cotton, too, is raised in large quantities." The *Shun-gan Keang* is the principal river of the province, and is of great importance for foreign commerce, supplying as it does direct water communication between some of the principal tea-growing districts and the neighbourhood of *Hang-chow*.

The province of *Keang-se* is bounded on the N. by *Keang-so*, *Hoo-pih* and *Gau-hung*, on the S. by *Kwang-tung*, on the E. by *Fuh-keen*, and on the W. by *Ho-nan*. It extends over an area of 72,176 square miles, and its population by the last census was returned as being 19,000,000. It is divided into fourteen prefectures, and the provincial capital is *Nan-chang Foo*, a city situated on the *Kea Keang*, about 35 miles from the *Po-yang Lake*, into which the river empties itself. The whole province is mountainous, being traversed in a south-westerly and north-easterly direction by the *Nan-shan rangs*. The largest river is the *Kea Keang*, which rises in the mountains in the south of the province and flows westward into the *Po-yang Lake* as mentioned above. During the summer time it has water of sufficient depth for steamers of light draught as far as *Nan-chang*, and it is navigable by native craft for a considerable distance beyond that city. Another river of note is the *Chang Keang*, which has its source in the province of *Gau-hung*, and flows into the *Po-yang Lake*, connecting in its course the *Woo-yuen* district, from whence come the celebrated "Moyne," green teas, and the city of *Kung-th-chin*, celebrated for its pottery, with *Jaon-chow Foo* on the lake. The black "Kaisow" teas are brought from the *Ho-kow* district, where they are grown, down the *River Kin* to *Juy-hung* on the lake, and the *Sou-ho* connects by a navigable stream *E-ning Choo*, in the neighbourhood of which city the best black teas of this part of China are produced, with *Woo-ching*, the principal mart of trade on the lake. The principal productions of the province are tea (of which 32,733,053 lb were exported in 1874), China ware, grass cloth, hemp, paper, tobacco,

and tallow. *Kew-keang*, the Treaty Port of the province, is situated on the *Yang-tsze Keang*, a short distance above the junction of the *Po-yang Lake* with that river. According to the foreign trade returns for this port for the year 1874, it appears that the value of the imports was £1,179,895, 5s., and that of the exports, £2,976,503, 14s.

Chě-keang. The province of *Chě-keang* is bounded on the N. by the province of *Keang-soo*, on the E. by the sea, on the S. by the province of *Fuh-keen*, and on the W. by the provinces of *Keang-se* and *Gan-hwuy*. It occupies an area of about 36,000 square miles, and contains a population of 21,000,000. With the exception of a small portion of the great delta plain, which extends across the frontier from the province of *Keang-soo*, and in which are situated the famous cities of *Hoo Chow*, *Kea-hing*, *Hang-chow*, *Shaou-hing*, and *Ning-po*, the province forms a portion of the *Nan-shan* of south-eastern China, and is hilly throughout. The *Nan-shan* ranges run through the centre of the province from S.W. to N.E., and divide it into a northern portion, the greater part of which is drained by the *Tseen-tang-keang*, and a southern portion which is chiefly occupied by the *Ta-che* basin. The valleys enclosed between the mountain ranges are numerous, fertile, and for the most part of exquisite beauty. The hilly portion of the province furnishes large supplies of tea, and in the plain which extends along the coast, north of *Ningpo*, a great quantity of silk is raised. In minerals the province is poor. Coal and iron are occasionally met with, and traces of copper ore are to be found in places, but none of these minerals exist in sufficiently large deposits to make mining remunerative. The principal cities are *Hang-chow* and the Treaty Port of *Ning-po*. In the foreign trade returns for *Ning-po* for 1874 the value of the imports during the year is described as having been £2,565,179, and that of the exports as £2,337,948. Among the latter articles we find tea, silk, cotton, dried cuttle fish, paper fans, straw hats, and medicines occupying the most prominent positions. The principal import was opium, the value of which alone amounted to £1,129,668. Cotton piece goods, annexed to which stands the next largest figure, were imported to the value of £430,692. Opposite *Ning-po*, at a distance of about 50 miles, lies the *Island of Chusan*, the largest of a group bearing that general name. This island is 21 miles long, and is about 50 miles in circumference. It is very mountainous, and is surrounded by numerous islands and islets. On its south side stands the walled town of *Ting-hai*, in front of which is the principal harbour. The population is returned as being 50,000.

Fuh-keen. The province of *Fuh-keen*, or, as it used to be called, *Min*, is bounded on the N. by the province of *Chě-keang*, on the S. by that of *Kwang-tung*, on the W. by that of *Keang-se*, and on the E. by the sea. It occupies an area of 53,480 square miles, and its population is estimated at 14,777,410. The provincial capital is *Fuh-chow Foo*, and it is divided into eleven prefectures, besides that ruled over by the prefect of the capital city. *Fuh-keen* is generally mountainous, being overspread by the *Nan-shan* ranges, which run a general course of N.E. and S.W. The principal river is the *Min*, which is formed by the junction, in the neighbourhood of the city of *Yen-ping Foo*, of three rivers,—namely, the *Keen-ke*, which takes its rise in the mountains on the western frontier in the prefecture of *Keen-ning Foo*, the *Fuh-tun Ke*, the source of which is found in the district of *Kwang-tsik* in the north-west of the province, and the *Shaou Ke*, which rises in the mountains in the western district of *Ning-kwa*. From *Yen-ping Foo* the river takes a somewhat south-easterly course, and after passing along the south face of the city of *Fuh-chow Foo*, empties itself into the sea about 30 miles below that town. Its upper course is narrow and rocky and abounds

in rapids, but as it approaches *Fuh-chow Foo* the channel widens, and the current becomes slow and even. Its depth is very irregular, and it is navigable only by native boats of a small class. Two other rivers flow into the sea near the island of *Amoy*, neither of which, however, is navigable for any distance from their mouths owing to the shallows and rapids with which they abound. The soil of the province is, as its name, "Happy Establishment," indicates, very productive, and the scenery is of a rich and varied character. Most of the hills are covered with verdure, and the less rugged are laid out in terraces. The principal products of the province are tea, of which the best kind is that known as *Bohea*, which takes its name, by a mispronunciation, from the *Woo-e Mountains*, in the prefecture of *Keenning Foo*, where it is grown; grains of various kinds, oranges, plantains, lichis, bamboo, ginger, gold, silver, lead, tin, iron, salt (both marine and rock), deers' horns, beeswax, sugar, fish, birds' nests, medicine, paper, cloth, timber, &c. *Fuh-keen* boasts of two Treaty Ports, *Fuh-chow Foo* and *Amoy*. The trade reports for 1874 show that the value of goods imported in foreign vessels to *Fuh-chow Foo* in that year amounted to £1,332,387, 11s. 8d., and that that of goods similarly exported amounted to £4,397,320, 19s. 4d. The chief articles of export from *Amoy* are tea, sugar, and sugar candy; of tea £1,129,090 worth was exported during the year 1874.

The Island of *Formosa*, or *Taiwan*, "the Great Bay," Island, as the Chinese call it, forms part of the province of *Fuh-keen*. Situated at a distance of about 80 or 90 miles from the mainland, its highest mountains can be easily recognized from the coast near *Amoy*. And so when Chinese historians assert that its existence first became known to their ancestors in the year 1480, they probably mean that at that date emigrants from the mainland first gained a footing in the island. At all events, when the Japanese two centuries later attempted to establish a colony in the island, they found there a Chinese population sufficiently numerous to be formidable. The island stretches from lat. 21° 53' 30" to lat. 25° 33'. In shape it is long and narrow. Its greatest width is about 70 miles, and it tapers off to a fine point at its southern extremity. A backbone of mountains runs from north to south through almost its entire length, leaving a plain on the western and northern portions. These level districts are occupied by Chinese settlers, while the mountains and their eastern slopes to the sea are inhabited by native tribes. The fertility of the plains has gained for *Formosa* the name of the Granary of China. On every available piece of land fields of rice and sugar are carefully cultivated, and recompense the farmer by yielding him constant and abundant crops. These alone, in addition to such products as jute, grass cloth, fibre, rice paper, and ratan, would make the island a valuable possession; but far more precious are the sulphur and the camphor, which are obtained from the mines and from the mountains of the island, and which are claimed by the Government as Crown monopolies. When taken from the mine the sulphur is boiled in iron boilers until the slate-like mineral assumes a treacle-like consistency. This is constantly stirred until every impurity is separated from the sulphur, which is then ladled out into wooden tubs shaped like sugar-loaves. In these it is left to cool, and the conical cake is freed from the tub by the simple process of knocking out the bottom of the latter. As the gigantic laurels from which the camphor is obtained are found only in the mountains in the possession of the natives, the acquisition of a constant supply is somewhat difficult. In 1874, however, 14,380½ cwt. of this commodity were exported from the ports of *Tam-suy* and *Kelung*. Petroleum also adds to the riches of the island. The Treaty Ports in *Formosa* are *Tai-wan Foo* (including

Ta-kow) on the south-west coast, and *Tam-suy* (including *Kelang*) on the north-west and north coast. The foreign trade returns for *Tai-wan Foo* for 1874 show that goods to the value of £1,678,858 were imported during the year, and that £1,840,016 was the value of the exports during the same period. The *Tam-suy* returns present much smaller totals; £304,243 represents the value of the imports, and £203,428 that of the exports in 1874.

Hoo-pih.

The province of *Hoo-pih*, "North of the Lakes," is bounded on the N. by *Ho-nan*, on the E. by *Gan-hwuy*, on the S. by *Hoo-nan*, and on the W. by *Shen-se* and *Sze-chuen*. It occupies an area of 70,450 square miles, and contains a population of 27,370,098. The most important city within its borders is the Treaty Port of *Han-kow*, besides which it contains ten other prefectural cities. The greater part of the province forms a plain, and its most noticeable feature is the *Han River*, which runs in a south-easterly direction across the province from its north-westerly corner to its junction with the *Yang-tze Keang* at *Han-kow*. The products of the *Han* valley are exclusively agricultural, consisting of cotton, wheat, rape seed, tobacco, and various kinds of beans. Vegetable tallow is also exported in large quantities from this part of *Hoo-pih*. Gold is found in the *Han*, but not in sufficient quantities to make working it more than barely remunerative. It is washed every winter from banks of coarse gravel, a little above *H-ching Hcen*, on which it is deposited by the river. Every winter the supply is exhausted by the washers, and every summer it is renewed by the river. Baron von Richthofen reckoned that the digger earned from 50 to 150 cash a day. Only one waggon road leads northwards from *Hoo-pih*, and that is to *Nan-yang Foo* in *Ho-nan*, where it forks, one branch going to *Peking* by way of *Kai-fung Foo*, and the other into *Shan-se* by *Ho-nan Foo*. According to the *Consular Trade Reports* for 1874, the value of the foreign trade at *Han-kow* during that year amounted to £9,775,754, of which sum £4,388,113 represents the value of the imports, and £5,387,641 that of the exports.

Hoo-nan.

The province of *Hoo-nan*, "South of the Lakes," is bounded on the N. by *Hoo-pih*, on the E. by *Keang-se*, on the S. by *Kwang-se* and *Kwang-tung*, and on the W. by *Kwei-chow* and *Sze-chuen*. It occupies an area of 84,000 square miles, and its population is estimated at 18,652,507. The provincial capital is *Chang-shu Foo*, in addition to which it counts eight prefectural cities within its boundaries. It is essentially a province of hills, the only plain of any extent being that around the *Tung-ting Lake*, but this extends little beyond the area which in summer forms part of the lake. To the north of *Hang-chow Foo* detached groups of higher mountains than are found in the southern portion of the province are met with. Among these is the *Hang-shan*, one of the *Woo-yo*, or five sacred mountains of China, upon which the celebrated tablet of Yu was placed. The principal rivers of the province are—(1.) The *Seang-keang*, which takes its rise in the *Nan-shan*, and empties itself into the *Tung-ting Lake*; it is navigable for a great distance from its mouth, and the area of its basin is 39,000 square miles; (2.) The *Tze-keang*, the basin of which covers an area of 10,000 square miles, and which is full of rapids, and navigable only for the smallest kinds of boats; and (3.) The *Yuen-keang*, a large river, which has some of its head-waters in the province of *Kwei-chow*, and which empties itself into the *Tung-ting Lake* in the neighbourhood of *Chang-th Foo*;—its basin has an area of 34,300 square miles, 22,500 of which are in the province of *Hoo-nan*, and 12,500 in that of *Kwei-chow*; its navigation is difficult and dangerous, and only small boats are able to pass beyond *Hang-keu*, a mart situated about 500 li above

Chang-th Foo; and (4.) The *Ling-keang*, which flows from the tea district of *Ho-fung Chow* to the *Tung-ting Lake*. Its basin covers an area of about 8000 square miles, and it is navigable only in its lowest portion. The principal places of commerce are—(1.) *Seang-tang*, on the *Seang-keang*, which is said to contain 1,000,000 inhabitants, and to extend three miles long by five li deep; (2.) *Chang-shu Foo*, the provincial capital on the same river; and (3.) *Chang-th Foo*, on the *Yuen-keang*. The products of the province are tea (the best quality of which is grown at *Gan-hwa*, and the greatest quantity at *Ping-keang*), hemp, cotton, rice, paper, tobacco, tea-oil, and coal. This last is by far the most important of the mineral products of *Hoo-nan*. The whole of the south-eastern portion of the province is one vast coal-field, extending over an area of 21,700 square miles. This area is divided into two nearly equal parts,—one, the *Luy River* coal-fields, yielding anthracite, and the other the *Seang River* coal-fields, yielding bituminous coal. The people are, as a rule, more generally prosperous than are the inhabitants of the other provinces, and Baron von Richthofen, in the course of his journey through the province, noticed with surprise the number of fine country seats owned by rich men who had retired from business, which were scattered over the rural districts. Almost all the traffic is conveyed through *Hoo-nan* by water-ways, which lead northward to *Han-kow* on the *Yang-tze Keang*, and *Han-ching* on the *Han River*, eastward to *Fuh-keen*, southward to *Kwang-tung* and *Kwang-se*, and westward to *Sze-chuen*. One of the leading features of the province is the *Tung-ting Lake*, which has been already described.

The province of *Shen-se* is bounded on the N. by the *Shen-se Great Wall*, on the W. by the province of *Kan-suh*, on the S. by the province of *Sze-chuen*, and on the E. by *Shan-se*, from which it is separated by the Yellow River. It contains an area of 67,400 square miles, and its population was said to number upwards of 10,000,000 before the outbreak of the late Mahometan rebellion. *Se-gan Foo* is the provincial capital, and besides this there are seven prefectural cities in the province. *Shen-se* is divided into two parts by a barrier of mountains, consisting of the *Foo-new Shan* and the *Tsing-ling Shan*, which runs across the southern portion of the province from east to west. To the north of the mountains lie the basins of the *Wei River* and of several other tributaries to the *Hwang-ho*. The position of the *Wei* basin is peculiar. Cut off from the rest of China on the east by the Yellow River, and on the south by the mountains, it yet forms the great channel of communication with Central Asia. Its position, therefore, in a strategical point of view is at once apparent. Were it in the hands of an enemy the Chinese colonies in Central Asia would be completely severed from the mother country, and hence the eagerness which has been evinced by the Government throughout all history to retain possession of the region. For upwards of 2000 years, with the exception of intervals, from 1122 B.C. to 1127 A.D., the city of *Se-gan Foo*, which lies in the basin, was the capital of the empire. Its walls enclose a square space of six geographical miles each way, and, unlike most Chinese cities, its fortifications are kept in perfect repair. During the late Mahometan rebellion it was closely invested for two years by the rebels, who however failed to make themselves masters of it. From *Se-gan Foo* radiate a number of roads going east, south, and west. The east road is the great *Tung-kuan* road, which forms the principal means of communication between *Peking* and the north-eastern provinces of the empire, and *Sze-chuen*, *Yun-nan*, and *Tibet*. To the south, one road crosses the mountains to *Shang Chow*, and on to the *Tan River*, an affluent of the *Han River*, and is thus connected with the

trade of the *Yang-tze Keang*; and another leads to *Han-chung Foo* and *Sze-chuen*. Leaving the west gate of the city two roads lead to *Lan-chow Foo*, from which town commences the great high road into Central Asia by way of *Leang-chow Foo*, *Kan-chow Foo* and *Suh-chow* to *Hami*, where it forks into two branches, which follow respectively the northern and southern foot of the *Teen-shan* range, and are known as the *Teen-shan pih loo* and the *Teen-shan nan loo*. It was along these roads that the fame of China first reached Europe, and it was by the *Teen-shan nan loo* that Marco Polo entered the empire. To defend this line of communication the Great Wall was extended to beyond *Suh Chow*, and the *Kea-yu* gate, which is the door of the empire, was built. During the reign of Hca-woo Tc of the Han dynasty Chinese colonies and high roads lined with fortified cities were established along this route, and though at times the Government have lost possession of the line beyond the Great Wall, it has always succeeded in re-establishing its supremacy over it, and the earlier emperors of the present dynasty established a firmer hold over the *Teen-shan pih loo* and *li* than any of their predecessors had been able to acquire. Occupying a position, then, at the confluence of the roads which connect north-eastern China with its western and south-western portions, *Se-gan Foo* is naturally a city of great commercial importance. Producing no manufactures of its own, its trade consists principally in the importation of silk from *Chê-keang* and *Sze-chuen*, tea from *Hoo-pih* and *Hoo-nan*, and sugar from *Sze-chuen*, and in the exportation of these and other articles of commerce to *Kan-suh*, Russia, and Central Asia. *Shen-se* is purely an agricultural province, and produces nothing for the foreign markets. Its principal products are cotton, wheat, and opium, and these it exchanges with the neighbouring provinces for coal, iron, salt, &c. But besides these, kaou-leang, pulse, millet, maize, groundnut, barley, beans, pease, lucerne, and rape seed are grown. The *Wei* basin is the greatest agricultural country in the north-west. Being a loess region it is unfit for rice, but for the same reason it produces fine crops of the kinds mentioned at a minimum expenditure of labour. The *Shen-se* opium is much valued by smokers, and ranks next to the *Shan-se* drug, which is second only to that produced in *Kan-suh*. Coal abounds in the northern part of the province, but owing to difficulty of transit it is not worked to any great extent. The winters are cold, but short, and though fruit trees abound and are most productive, no evergreen trees or shrubs are to be met with within the province.

Kan-suh. The province of *Kan-suh*, which derives its name from the first syllables of the names of the two cities *Kan-chow Foo* and *Suh-chow*, is bounded on the N.E. by the Ordo Mongol tribes and the Desert of Gobi, on the E. by *Shen-se*, on the S. by *Sze-chuen*, on the S.W. by Kokonor and the Desert of Gobi, and on the N.W. by Kobdo and *li*. The boundary on the N. remains undefined, but the province may be said to occupy the territory lying between lat. 32° 30' and 40°, and long. 108° to 98° 20', and to contain an area of about 86,688 square miles. The population is estimated at 15,193,125. *Kan-suh* is for the most part a howling wilderness of sand and snow, but to the east of the Yellow River the country is cultivated, and to some extent productive. The principal river is the Yellow River, the course of which through the province has already been described, and in the mountains to the south of *Lan-chow Foo* rises the *Wei River*, which traverses *Shen-se*, and flows into the Yellow River at *Tung-kwan*. The chief products of *Kan-suh* are cloth, horse hides, a kind of curd like butter "which melts in the mouth," and is known by the Mongols under the name of *Wuta*, musk, plums, onions, dates, sweet melons, and medicines.

Sze-chuen, "the Four Streams," is the largest province *Sze-chuen* in China. It is bounded on the N. by Kokonor, *Kan-suh*, and *Shan-se*, on the E. by *Hoo-pih* and *Hoo-nan*, on the S. by *Kwei-chow* and *Yun-nan*, and on the W. by Tibet. Its population is estimated at 35,000,000; it occupies an area of 220,000 square miles, and contains fifteen prefectural cities, inclusive of *Ching-too Foo*, the provincial capital. The western portion of the province forms part of the mountain-lands of Central Asia, and the eastern portion, comprising about 100,000 square miles, is, with the exception of the plain on which the city of *Ching-too Foo* is situated, emphatically a hilly region. The boundaries of this hilly region may be described by lines drawn from *Lung-gan Foo* to *Kwei-chow Foo* on the N., from *Kwei-chow Foo* to *Yung-ning Heen* on the S.E., and from this latter place to *Lung-gan Foo* on the W. The ethnological and commercial boundaries are clearly and sharply drawn by these physical features. The mountain districts are poorly cultivated, and are inhabited by "Ejin," or Barbarians, who are distinguished under the tribal names of *Se-fan*, *Lo-lo*, and *Mau-tsze*, and whose allegiance to the Chinese Government sits but lightly on them, while the eastern portion is exclusively Chinese, and is one of the most thriving and populous regions in the empire. Through the southern portion of it runs the *Yang-tze Keang*, which is there navigable throughout the year, while it is traversed by three large rivers, the *Min-keang*, the *To-keang*, and the *Kea-ling Keang*, all of which take their rise in the mountains on its north-west border, and empty themselves into the *Yang-tze Keang* at *Seu-chow Foo*, *Loo Chow*, and *Chung-king Foo* respectively. The whole province is intersected by numerous but difficult roads. The *Ta-pih-loo*, or great north road, leads from *Ching-too Foo* to *Peking*. From the same centre there branches out one to *Chung-king Foo*, one to *Paou-ning Foo*, and one to *Ya-chow Foo*, while another road connects *Chung-king Foo* with *Kwei-chow Foo* on the *Yang-tze Keang* and beyond with *E-chang Foo* in *Hoo-pih*. From *Ya-chow Foo*, again, start two important roads, one leading into Tibet by way of *Yung-king Heen*, *Tsing-ke Heen*, *Tu-tseen-loo*, *Le-tang*, *Pa-tang*, and *Tsiamdo*, and the other to Western *Yun-nan* via *Tsing-ke Heen*, *Ning-yuen Foo*, and *Yen-yuen Heen* to *Ta-le Foo*. From *Ta-le Foo* this road continues through *Momien* to *Bhamo* in *Burmah*. Another road connects *Pa-tang* and *Le-keang Foo* with *Ta-le Foo*, and yet another crosses the southernmost corner of the province connecting *Tung-chuen Foo* in *Yun-nan* with *Ta-le Foo* in the same province.

The products of *Sze-chuen* are varied and valuable, and, unlike those of the northern provinces of China, are eminently suitable for foreign export. First on the list stands silk, and of this article of commerce a larger quantity is produced in eastern *Sze-chuen* than in any other province of the empire. There are few districts in this region in which silk is not produced, and though it is somewhat inferior in quality to that produced in *Chê-keang* yet in strength and durability it is so far superior to it that it is able to compete successfully with the finer kind in the market. Large quantities are exported to *Shen-se*, *Shan-se*, *Kan-suh*, *Peking*, *Yun-nan*, Tibet, *Kwei-chow*, *Kuang-se*, *Hoo-nan*, and *Hoo-pih*, and lately it has begun to figure in the *Shanghai* returns as an article of foreign export. The cultivation of the poppy is largely carried on in the same portion of the province. The opium produced is, however, of an inferior quality, and the exportation therefore is limited to those provinces which from exceptional circumstances are unable to procure the better description of drug from elsewhere. White wax is another of the most valuable articles of the *Sze-chuen* trade. It is made exclusively in the department of *Keating Foo*, the climate of which appears to favour the pro-

pagation of the disease among the insects which is said by the natives to be the cause of the plentiful secretion of wax. This belief is borne out by the fact, that in the districts where the insects breed only a small quantity of wax is produced, and experience has therefore taught the natives the advantage of breeding the insects in one district and producing the wax in another. The region of *Keen-chung* in the south of the province has been found most suitable for breeding purposes, and it is there, therefore, on the insect trees, which are evergreens with large and pointed ovate leaves, that the breeding processes are carried on. At the end of April the producers start each with a load of the eggs of the insects for the district of *Kea-ting Foo*, a journey which on foot occupies about a fortnight. The road between the two districts is very mountainous, and as exposure to the heat of the sun would hatch the eggs too rapidly, the travellers journey only during the night. At *Kea-ting Foo* they are eagerly bought up, and are at once put upon the wax tree. Baron von Richthofen thus describes the subsequent process:—"When the egg balls are procured they are folded up, six or seven together, in a bag of palm leaf. These bags are suspended on the twigs of the trees. This is all the human labour required. After a few days the insects commence coming out. They spread as a brownish film over the twigs, but do not touch the leaves. The Chinese describe them as having neither shape, nor head, nor eyes, nor feet. It is known that the insect is a species of cocoon. Gradually, while the insect is growing, the surface of the twigs becomes encrusted with a white substance; this is the wax. No care whatever is required. The insect has no enemy, and is not even touched by ants. In the latter half of August the twigs are cut off and boiled in water, when the wax rises to the surface. It is then melted and poured into deep pans. It cools down to a translucent and highly crystalline substance. Ten taels weight of eggs produce from two to three canties of wax." Tobacco is another article which occupies a prominent place among the productions of *Sze-chuen*. It is grown very generally throughout the province, and is exported in large quantities to *Se-fan*, *Tibet*, *Yun-nan*, *Hoo-nan*; and the export to *Han-kow* alone is estimated at 50,000 piculs annually. The best is grown in the district of *Pe Heen*; the next quality is said to come from *Kin-lan Heen*, and the third quality from *She-fang Heen*, all these districts being in the plain of *Ching-too Foo*. The habit, which is unknown in other provinces, of smoking the tobacco leaves rolled up in the shape of cigars obtains largely in *Sze-chuen*. Salt is also produced in *Sze-chuen* in large quantities from brine, which is raised from wells. *Tse-liu-tsing*, in *Tse Chow*, *Woo-tung-keao*, near *Kea-ting Foo*, *Paou-ning Foo*, and *Tung-chuen Foo*, are the districts where the wells are most abundant. The brine is raised from the well with long bamboo tubes and bamboo ropes, and is then led to large pans for evaporation. In the district of *Tse-liu-tsing* potash is struck at a depth of from 1800 to 2000 feet, and is used for evaporating the brine. Coal and iron are found in many parts of the province, but the only coal which is worked is of an inferior quality, and the iron is smelted with wood alone. Sugar, tung oil, wheat, barley, beans, rice, Indian corn, potatoes, &c., are among the other products of *Sze-chuen*. From the list of exports and re-exports from *Han-kow* in the Trade Returns for 1871, Baron von Richthofen has made a list of the proximate value of the exports of *Sze-chuen* in this direction.

	Piculs.	Value in Taels.
Sze-chuen Silk	4,075	804,019
Safflower	4,837	294,795
White Wax	10,765	647,029
Carry forward,		1,835,843

	Piculs.	Value in Taels.
Brought forward,		1,835,843
Sze-chuen rhubarb	2,761	35,616
Musk	14	68,629
Spelter	1,913	7,435
Copper	515	21,658
Wood-oil	290,441	1,825,701
Total, Taels		3,784,882

Ying-yuen Foo is the principal district from which the copper is produced, as much as from 500 to 600 tons a year being exported from this one prefecture. The mines are owned by private companies, who are bound by the terms of their license to sell the metal at a fixed price (8 taels per picul) to certain holders of a Government concession, who on their part are bound to pay 2 taels per picul into the provincial treasury.

The province of *Kwang-tung* is bounded on the N. by *Kwang Hoo-nan*, *Keang-se*, and *Fuh-keen*, on the S. and E. by the sea, and on the W. by *Kwang-se*. It contains an area of 79,456 square miles, and is divided into nine prefectures; and the population is estimated at about 19,174,030. Its name, which signifies "East of Kwang," is derived, according to Chinese writers, from the fact of its being to the east of the old province of *Hoo-kwang*, in the same way that *Kwang-se* derives its name from its position to the west of *Hoo-kwang*. *Kwang-tung* extends for more than 600 miles from E. to W., and for about 420 from N. to S. It may be described as a hilly region, forming part as it does of the *Nan Shan* ranges. These mountains, speaking generally, trend in a north-east and south-westerly direction, and are divided by valleys of great fertility. The principal rivers of the province are the *Se-keang*, which has been already described; the *Pih-keang*, or North River, which rises in the mountains to the north of the province, and after a southerly course joins the *Se-keang* at *San-shway Heen*; the *Tung-keang*, or East River, which after flowing in a south-westerly direction from its source in the north-east of the province, empties itself into the estuary which separates the city of *Canton* from the sea; and the *Han River*, which runs a north and south course across the eastern portion of the province, taking its rise in the mountains on the western frontier of *Fuh-keen*, and emptying itself into the China Sea in the neighbourhood of *Swatow*. *Kwang-tung* is one of the most productive provinces of the empire. Its mineral wealth is very considerable, and the soil of the valleys and plains is extremely fertile. The principal article of export is silk, which is produced in the district forming the river delta, extending from *Canton* to *Macao* and having its apex at *San-shway Heen*. The value of the silk and of silken manufactures, especially textiles which are annually exported from *Canton* in foreign bottoms, is estimated at about 14,000,000 dollars. Tea is also grown in many districts, and is exported annually to the amount of about 3,000,000 dollars; cassia lignea, together with cassia buds and twigs (from the sub-prefecture of *Lo-ting*, 150 miles east of *Canton*), matting, fire-crackers, sugar, and palm leaf fans, which are annually exported to the number of 4,000,000 or 5,000,000 to New York alone, are among the other prominent articles of merchandize. Sugar is grown on the banks of almost all the rivers, and 40 per cent. of the ground under cultivation in the districts of *Pwan-yu*, *Tung-kean*, and *Tsung-ching*, is occupied by sugar plantations. Out of the total exports from *Swatow* during the year 1874, which amounted in value to £4,367,739, sugar was put down as representing £1,023,810. Three large coal-fields exist in the province, namely, the *Shao-chow Foo* field in the north; the *Hua Heen* field distant about 30 miles from *Canton*; and the west coast field, in the south-west. The last is by far the largest of the three, and extends over the districts of *Hoo-*

chuen, Teen-pih, Yang-keang, Yang-chuen, Gan-ping, Kae-ping, Sin-hing, Ho-shan, Sin-hwang and Sin-ning. The coal from the two first named fields is of an inferior quality, but that in the west coast field is of a more valuable kind. Iron ore is found in about twenty different districts, notably in *Tsing-yuen, Tsung-ja, Lung-mun, and Luh-fung.* None, however, is exported in its raw state, as all which is produced is manufactured in the province, and principally at *Fat-shan*, which has been called the Birmingham of China. The *Kwang-tung* coast abounds with islands, the largest of which is *Hainan*, which forms part of the prefecture of *Keung-chow Foo.* This island extends for about 100 miles from north to south, and the same distance from east to west. The southern and eastern portions of *Hainan* are mountainous, but on the north there is a plain of some extent. Gold is found in the central part; and sugar, cocoa nuts, betel nuts, birds' nests, and agar agar, or sea vegetable, are among the other products of the island. By the terms of the treaty *Keung-chow Foo* on the north coast was to be a Treaty Port, and it is now about to be opened to trade. In the province of *Kwang-tung* there are two Treaty Ports, namely, *Canton* and *Suatow.* At *Canton* the value of the exports carried in foreign vessels during the year 1874 amounted to £4,672,128, and of imports to £1,985,701. The value of the imports to *Suatow* during the same period was £3,317,297, and of the exports £1,310,321.

Kwang-se. The province of *Kwang-se* is bounded on the N. by *Kwei-chow* and *Hoo-nan*, on the E. by *Kwang-tung*, on the S. by the Gulf of Tonquin and *Cochin-china*, and on the W. by *Yun-nan.* It covers an area of 78,250 square miles, and its population is estimated at 7,313,895. The provincial capital is *Kwei-ling Foo*, or City of the Forest of Cinnamon Trees, and there are besides ten prefectural cities. In the south and east parts of the province the surface is mountainous, but in the north the mountains are exchanged for hills and plains. The principal rivers are the *Se-keang*, the course of which has been described above, and the *Kwei-keang*, or Cinnamon River, which takes its rise in the district of *Hing-gan*, in the north of the province, and in the neighbourhood of that of the *Seang River*, which flows northward through *Hoo-nan* to the *Tung-ting Lake.* The *Kwei-keang*, on the other hand, takes a southerly course, and passes the cities of *Kwei-lin, Yang-so Heen, Ping-lö Foo, Chaou-ping Heen*, and so finds its way to *Woo-chow Foo*, where it joins the waters of the *Se-Keang.* Another considerable river is the *Lew-Keang*, or Willow River, which rises in the mountains inhabited by the *Meaou-tsze*, in the district of *Yung-tung*, in *Kwei-chow.* Leaving its source it takes a south-easterly direction, and enters *Kwang-se*, in the district of *Huae-yuen.* After encircling the city of that name, it flows south as far as *Lew-ching Heen*, where it forms a junction with the *Lung-keang*, or Dragon River. Adopting the trend of this last-named stream, which has its head-waters in *Yun-nan*, the mingled flow passes eastward, and further on in a south-easterly direction, by *Lew-chow Foo, Woo-seuen Heen, and Sin-chow Foo*, where it receives the waters of the *Se-keang*, and thenceforth changes its name for that of its affluent.

Kwei-chow. The province of *Kwei-chow* is bounded on the N. by *Sze-chuen*, on the E. by *Hoo-nan*, on the S. by *Kwang-se*, and on the W. by *Yun-nan.* It contains 64,554 square miles, and has a population of about 5,288,219. *Kwei-yang Foo* is the provincial capital, and besides this there are eleven prefectural cities in the province. With the exception of plains in the neighbourhood of *Kwei-yang Foo, Ta-ling Foo, and Tsun-e Foo*, in the central and northern regions, the province may be described as mountainous. But the very disturbed state in which it has been for many years makes it difficult to gain much information

about it. The mountain ranges in the south are largely inhabited by *Meaou-tsze*, who are the original owners of the soil, and who have been goaded into a state of rebellion by the oppression to which they have been subjected by the Chinese officials. To this disturbing cause has been added also another by the spread of the Mahometan rebellion of *Yun-nan* into some of the south-western districts of the province. The devastating effects of these civil wars have been most disastrous to the trade and the prosperity of *Kwei-chow.* The climate is by nature unhealthy, the supply of running water being small, and that of stagnant water, from which arises a very fatal malaria, being considerable; but it is at the present time rendered still more dangerous by the number of corpses which are left to putrefy in the fields. The agricultural products of the province are very limited, and its chief wealth lies in its minerals. Copper, silver, lead, and zinc are found in considerable quantities, and as regards quicksilver, *Kwei-chow* is probably the richest country in the world. It has been from of old the chief product of the province, and the belt in which it occurs extends through the whole province from south-west to north-east. One of the principal mining districts is *Kae Chow*, in the prefecture of *Kwei-yang Foo*, and this district has the advantage of being situated near *Wang-ping Chow*, from which place it can be conveniently and cheaply shipped to *Hankow.* Cinnabar, realgar, orpiment, and coal form the rest of the mineral products of *Kwei-chow.* Wild silk is another valuable article of export. It is chiefly manufactured in the prefecture of *Tsun-e Foo*, where three kinds are produced. The first quality, the trade in which is estimated at about 500,000 taels a year, is chiefly exported to *Shen-se, Shan-se, and Peking*, while some finds its way to *Seang-tan* and so into *Kwang-se.* The inferior kinds are locally consumed.

The province of *Yun-nan*, "South of the Clouds," is bounded on the N. by *Sze-chuen*, on the E. by *Kwei-chow* and *Kwang-se*, on the S. by *Burmah* and the *Lao* tribes, and on the W. by *Burmah* and *Tibet.* It occupies an area of 107,969 square miles, but though thus the second largest province of the empire, its population is estimated at only 5,561,320, and probably this number is at the present time, in consequence of the long continuance and violent extinction of the *Panthay* rebellion, excessive. The greater part of the province may be said to consist of an extensive plateau, containing numerous valley plains, which is divided in the northern portion by mountain ranges that enter at the north-west corner of the province and separate the waters of the *Kin-sha-keang*, the *Meikon*, and the *Salwein.* Besides *Yun-nan Foo*, the capital, the province contains twenty prefectural cities, several of which—*Tung-chuen Foo, Yun-nan Foo, Ta-le Foo, Yung-chang Foo, Tsou-heung Foo, and Ling-gan Foo*, for example—are situated in the valley plains just spoken of. The principal rivers are the *Meikon*, which traverses the province from north to south on its way to the *China Sea* through *Anam*; the *Salwein*, which runs a parallel course through its western portion; the *Kin-sha-keang*, which runs first in a south-east and then in an easterly direction through the north of the province; and the head-waters of the *Songka*, which takes its rise in the south-eastern part of the province. This last-named river forms a navigable communication from *Yun-nan* to the Gulf of *Tong-king* where it empties itself into the sea. The navigation commences at *Man-haou*, a town only ten days' journey from *Yun-nan Foo*, and it thus affords an easy outlet for the mining districts of eastern and southern *Yun-nan.* There are two large lakes in the province,—one in the neighbourhood of *Ta-le Foo*, which is 24 miles in length by 6 miles in breadth, and the other

near *Yun-nan Foo*, which measures from 70 to 80 miles in circumference. Several important roads intersect the province, the chief of which are—1. The road from *Yun-nan Foo* to *Bhamo* in *Burmah* via *Ta-le Foo* (12 days), *Tung-yue Chow* or *Momien* (8 days), and *Manwyna*,—an easy road as far as *Ta-le Foo*, but beyond this city the mountain ranges spoken of above present obstacles of no little difficulty; 2. The road from *Ta-le Foo* northwards to *Batang* via *Le-keang Foo*, which thus connects western *Yun-nan* with *Tibet*; 3. The road spoken of in the description of *Sze-chuen*, from *Ta-le Foo* to *Ching-too Foo* via *Ning-yuen Foo* and *Ya-chow Foo*; 4. The road from *Yun-nan Foo* to *Sen-chow Foo*, via *Tung-chuen Foo* and *Chaou-tung Foo*; 5. The road from the same city to *Wang-ping Chow*, in *Kwei-chow*, via *Kwei-yang Foo*, and down the *Yuen River* to *Chang-tih Foo* in *Hoo-nan*; and 6. the ancient and important trade road to *Canton*. This route connects *Yun-nan Foo* with *Pih-se Foo*, in *Kwang-se*, on the *Canton* west river, a land journey which occupies about twenty days. From this point the river furnishes in quiet times an easy communication with *Canton*, but of late, owing to the disturbed condition of *Kwang-se*, this route has been little used. The agricultural products of the province are fully sufficient to supply the wants of the inhabitants, but its chief wealth lies in the minerals with which it abounds. On this subject *Baron von Richtshofen* says, "We are now in an extremely remarkable region, which is highly worthy a detailed examination, because a great variety and quality of metalliferous deposits are distributed throughout its extent. The country so distinguished comprehends nearly the whole of *Yun-nan*, from *Ta-kwan-ting* in the north to *Po-nrh Foo* in the south, and from the eastern boundary of the province to *Tung-yue Chow* (*Momien*) in the west. Besides, it extends across the *Yang-tse*, and comprises the whole department of *Ning-yuen Foo*, till *Tsing-ke Heen*, a district of *Ya-chow Foo*; and in the east, the district of *Wei-ning Chow* in *Kwei-chow*. There are no positive indications to show that the metalliferous region extends beyond those limits to the south, west, and north, but this is different as regards the direction to the east, or rather north-east. I have had several statements given me concerning the occurrence of ores of copper and silver through a large portion of *Kwei-chow*; but as no mines are worked outside of *Wei-ning Chow*, the statement cannot be considered as proved. It is, however, a remarkable fact, that immediately adjoining the metalliferous region of *Yun-nan* to the north-east, commences a belt distinguished by the occurrence of quicksilver and its ores. It extends through the whole width of the province of *Kwei-chow*. Quicksilver is found only in this belt, and not in *Yun-nan*."

Silver and gold are among the metals produced in *Yun-nan*, but they are not known to exist in any large quantities. Lead is of frequent occurrence in the province, and indeed the area through which copper, silver, lead, tin, and zinc are distributed in sufficient quantities to make mining answer, comprises at least 80,000 square miles. The ores are generally of good quality, and are so deposited as to be easy of extraction. Tea from *Po-nrh Foo*, in southern *Yun-nan*, which is well known and appreciated throughout the empire; opium of an inferior quality; medicines in the shape not only of herbs and roots, but also of fossil shells, bones, teeth, and various products of the animal kingdom; and precious stones, principally jade and rubies, are among the other exports from *Yun-nan*.

Shing-king. The imperial province of *Shing-king*, in southern Manchuria, is bounded on the N. by *Mongolia* and *Tsi-tsi-har*; on the E. by the newly-acquired Russian province of *Amoor*, the Sea of Japan, and *Corea*; on the S. by *Corea*, the *Yellow Sea*, and the *Gulf of Leaou-tung*; and on the W. by *Mongolia*. It occupies an area of 43,000 square

miles, and contains a population of 6,000,000. Its capital city is *Monkden* (41° 40' N. lat., 130° 30' E. long.) or, as it is otherwise known, *Shing-king*, "the Flourishing Capital," or *Shin-yang*; and besides this it has one other prefectural city, namely, *Kin-chow Foo*. The surface of the province is divided between plain and mountain, the latter feature largely predominating. A line drawn from *Kin-chow Foo* (41° 12' N. lat., 121° 10' E. long.) north-east to *Monkden*, and then south by west through *Leaou-yang* and *Hai-ching* to *Kai-chow* and the sea, would define the level country, the rest of the province consisting of mountains intersected with valleys. A large portion of the plain being an alluvial deposit is extremely fertile, but in the neighbourhood of the sea that saline exudation so common in the north of China renders futile all attempts at cultivation. To the north and east of this district run numerous mountain ranges, for the most part in a north-and-southerly direction. The climate of *Shing-king* is marked by extremes of heat and cold. In summer the temperature varies from 70° to 90°, and in winter from 50° above to 10° below zero. The mountain scenery is extremely picturesque, and the trees and shrubs are such as are common in England, the mountain ash being the only common English tree which is there conspicuous by its absence. The most important rivers are the *Leaou-ho* and the *Ta-yang-ho*. The former takes its rise in *Mongolia*, and after running an easterly course for about 400 miles, turns in a south-westerly direction, and empties itself into the *Gulf of Leaou-tung*, in the neighbourhood of *Ying-tse*, up to which town, 20 miles from the bar, the river is navigable for large junks. The *Ta-yang-ho* rises in the mountains to the south of the plain, and empties itself into the *Yellow Sea*. The principal roads through the province are—1st, The imperial highway from *Peking*, which passes through the Great Wall at *Shan-hai-kwan*, along the shores of the *Gulf of Pih-chih-li* to *Monkden*, and after leaving this city divides into three branches—one going eastward to *Corea*, another going by *Kirin* and *Alchuku* to *San-sing*, the limit of the empire in this direction, while a third diverges N. by W. to *Ta-kwo-mun*, thence through *Mongolia* to *Po-tu-na*, and then to *Tsi-tsi-har*, *Mergen*, and the *Amoor*; 2d, A road from *Ying-tse* southward to *Kin-chow*, in the extremity of the promontory of *Leaou-tung*; and 3d, a road from the same point in an easterly direction to *Fung-luang-ching* and the Gate of *Corea*. The Treaty Port of the province is *New-charang*, but owing to the difficulty of reaching this town, the foreign settlement has been established at *Ying-tse*. During 1874 the value of goods imported into this port was 2,433,135 taels, and that of exports was 1,753,543 taels. The chief agricultural products of *Shing-king* are wheat, barley, millet, oats, maize, cotton, indigo, and tobacco. Coal, iron, and gold are also found in considerable quantities in various localities, but as yet they are very little worked.

History.

Far reaching as is the history of China, it yet fails to give us any account of the origin of the Chinese race. Its first page begins by describing the nucleus of the nation as a little horde of wanderers, roving among the forests of *Shan-se*, without houses, without clothing, without fire to dress their victuals, and subsisting on the spoils of the chase, eked out with roots and insects. Investigation, however, has proved beyond doubt that these wanderers were no indigenous sons of the soil, but were strangers and pilgrims from other lands. Some believe that their point of departure was in the region to the south-east of the *Caspian Sea*, and that, having crossed the head waters of the *Oxus*, they made their way eastward along the southern slopes of the *Tecu-shan*. But however this may

be, it is plain that as they journeyed they struck on the northern course of the Yellow River, and that they followed its stream, on the eastern bank, as it trended south as far as Tung-kwan, and that then, turning with it due eastward, they established small colonies on the fertile plains of the modern province of Shan-se. But though these immigrants were for the moment wanderers they brought with them habits of settled labour. Some traces are discernible which might possibly be accepted as evidences that the Chinese had at one time a tendency to a nomadic rather than to an agricultural state of existence. In the *Book of Historical Documents* the governors of the province are called "pastors" and "herdsmen," and Mencius speaks of princes generally as "pastors of men." It is impossible also to overlook the identity of outline between the Chinese house and the sweeping roof supported by poles of the Tatar tent; and it is said that when Jengiz Khan in his invasion of China took a city, his soldiers immediately set about pulling down the four walls of the houses, leaving the overhanging roofs supported by the wooden columns,—by which process they converted them into excellent tents for themselves and their horses. To some extent it may be said, too, that the language commences this belief, since many common words find their expression in characters of which the hieroglyphics for sheep and cattle form part. For instance, we find that the character 義, meaning truthfulness, uprightness, is composed of the two parts, 羊 and 我, or "my sheep," thus apparently pointing to a time when the ownership of flocks was a common cause of dispute; the same is the case also with the character 若, *cho*, "right," which is made up of 自, *Tsze*, "one's own," and 羊, *yang*, "sheep," and 詳, *Tseang*, "to examine and judge clearly," which is composed of 言, *yen*, "words," or to talk, and 羊, "sheep," which would indicate that the first idea of a judicial examination arose out of wranglings about sheep. But notwithstanding these apparent evidences in favour of the Chinese having been originally a nomadic rather than an agricultural people, it becomes abundantly evident from the earliest records they possess that at all events, immediately on their arrival in China, they settled down as agriculturists. They cultivated grain for their sustenance, and flax, which they wove into garments. They knew the value of silk-worms and planted the mulberry tree; they developed trade, and established fairs at certain centres in their districts. Neither were they destitute of the elements of intellectual culture. They had some knowledge of astronomy, and in all probability they brought with them an acquaintanceship with hieroglyphic writing; at all events, at a very early period, we hear of *E Yin* (1743–1710 B.C.), presenting a petition in writing to the king, and there is no surer ground for the belief that knotted cords were in use among them before writing was invented than there is for the legend, that the forms of the characters were first suggested to Tsang-K'ê by the marks on the back of a tortoise.

The possession of these habits and acquirements gave the immigrants a great advantage over the nations of the land. As they advanced they found the country inhabited by "fiery dogs" on the north, "great bowmen" in the east, "the ungovernable vermin" on the south, and the "mounted warriors" on the west. Differing in language, as also in every other respect, from the invaders, these tribes became their natural enemies, but they were unable to stand against the "black-haired race." During the first centuries after the establishment of a regular system of government we hear of them now as common enemies of the Chinese, and now as temporary allies of one or another of the states into which the growing kingdom was

divided. But by degrees they drop out of the history of the empire. Step by step they were driven back into the less inhabited parts; whole tribes were transported, others were annihilated, until but a small remnant was left. These wanderers sought and found refuge from their enemies in the mountainous regions of Kwei-chow and Kwang-se, where their descendants, the Meau-tsze, still maintain themselves against the forces of China.

It was an ancient belief of Chinese writers that there had existed a period of 2,267,000 and odd years between the time when the powers of Heaven and Earth first united to produce man as the possessor of the soil of China, and the time of Confucius. This having been accepted as a fact, it became necessary for the early historians to invent long lines of dynastic rulers to fill up the gap between the creation and the period with which the *Book of Historical Documents* commences. Accordingly, we find a series of ten epochs described as preceding the Chow dynasty. The events connected with most of these are purely fabulous, and it is not until we come down to the eighth period that we can trace any glimmer, however obscured, of history. This, we are told, commenced with the reign of Yew-chou She (the Nest-having), who, if such a man ever existed, was probably one of the first of those who, as the immigrants increased and multiplied, was chosen to direct their counsels and to lead their armies. This chief induced them to settle within the bend of the Yellow River, the site of the modern province of Shan-se, and taught them to make huts of the boughs of trees. Under the next chief, Sny-jiu She (the Fire-producer), the grand discovery of fire was effected by the accidental friction of two pieces of dry wood. He taught the people to look up to *T'een*, the great creating, preserving, and destroying power; and he invented a method of registering time and events, by making certain knots on thongs or cords twisted out of the bark of trees. Next to him followed Yung-ching She, and then Fuh-he, who separated the people into classes or tribes, giving to each a particular name, discovered iron, appointed certain days to show their gratitude to heaven, by offering the first-fruits of the earth, and invented the eight diagrams which serve as the foundation of the Yih-king. Fuh-he reigned 115 years, and his tomb is shown at Chin-chou, in the province of Shen-se, at this day. His successor, Chin-nung, invented the plough; and from that moment the civilization of China proceeded by rapid and progressive steps.

As the early history of every ancient people is more or less vitiated by fable, we ought not to be more fastidious or less indulgent towards the marvellous in that of China, than we are towards Egyptian, Greek, or Roman history. The main facts may be true, though the details are incorrect; and though the accidental discovery of fire may not have happened under Suy-jin She, yet it probably was first communicated by the friction of two sticks, which at this day is a common method among almost all savages of producing fire. Nor is it perhaps strictly correct that Fuh-he made the accidental discovery of iron, by having burnt a quantity of wood on a brown earth, any more than that the Phœnicians discovered the mode of making glass by burning green wood on sand; yet it is not improbable that some such processes first led to these discoveries. And if it be objected against the history, that the reign of 115 years exceeds the usual period of human existence, this after all is as nothing, when compared with the contemporaneous ones recorded in biblical history. Thus, also, considerable allowances are to be deducted from the scientific discoveries of Chin-nung in botany, when we read of his having in one day discovered no less than seventy different species of plants that were of a poisonous nature, and seventy others that were antidotes against their baneful effects.

The next sovereign, Hwang-te, was a usurper; but during his reign the Chinese are stated to have made a very rapid progress in the arts and conveniences of civilized life; and to his lady, Se-ling-she, is ascribed the honour of having first observed the silk produced by the worms, of having unravelled their cocoons, and of having worked the fine filaments into a web of cloth. The tomb of Hwang-te is also preserved to this day in the province of Shen-se.

But with the reign of Yaou (2356 B.C.) we emerge to some extent from the mist which hangs over the earlier records of China. Here Confucius takes up the strain, and though his narrative will not bear criticism it yet furnishes us with some historical data. The character of Yaou and his successor Shun have been the theme of every writer on history from the time of Confucius downwards. So strong was the force of the examples they set that virtue pervaded the land, crime was unknown, and the nation increased in size and prosperity. During the reign of Yaou the empire extended from 23° to 40° N. lat., and from the 6th degree of longitude west from Peking to the 10th degree east. He established his capital at Ke-choo in Shun-tung, and established marts and fairs throughout the land. After his death he was succeeded by Shun, who for some years had shared with him the responsibilities of government. It was during this period that the "Great" Yu was employed to drain off the waters of the flood which had visited the north of China in consequence, probably, of one of the numerous changes in the course of the Yellow River. This work he accomplished after having expended nine years' labour upon it, and as a reward for this and other services he was raised to the throne on the death of Shun. After him succeeded a number of rulers, each one less qualified to govern than the last, until one K'eh (1818 B.C.) ascended the throne. In this man were combined all the worst vices of kings. He was licentious, cruel, faithless, and dissolute. From such a one Heaven withdrew her protection. The people rose against him, and having swept away all traces of him and his bloody house, they proclaimed the commencement of a new dynasty, to be called the Shang dynasty, and their leader, Tang, they named the first emperor of the new line (1766 B.C.). Aided by wise counsellors, this monarch restored to the country some of its former prosperity. But the same fatality which attended the descendants of Yu overtook also his successors. They became self-indulgent and effeminate. They lost all hold on the affections of their people, so that when Chow, aided and abetted by his consort Ta-ke, gave vent to passions of a more than usually cruel and debased nature, they revolted, and Woo-Wang ascended the throne as the first emperor of the Chow dynasty. Woo-Wang was all that tradition represents the founders of dynasties to have been. He was brave, talented, and virtuous, but he committed the mistake of dividing his kingdom into seventy-two feudal states in order that he might bestow principalities on his own relations and the descendants of former emperors. The fatal result of this subdivision soon became obvious. Jealousies sprang up among the princes, internecine wars raged unceasingly, and the allegiance of the feudatories to the central authority became daily weakened. Nor were the enemies of the empire confined to those within its borders, for, during the reign of Mu Wang (936 B.C.) we are told that the Tatars, of whom we now hear for the first time, taking advantage of the confusion which reigned within the limits of the empire, made predatory incursions into the states, and though they were invariably driven off, yet from this time they remained a constant source of danger and annoyance to the Chinese. Such was the state of the empire, distracted by internal wars and harassed by the attacks of a foreign foe, when Confucius was born

(551 B.C.), and though the sage devoted his life to the promulgation of virtue and the right principles of government, little or no heed was at the time paid to his remonstrances and exhortations, and he died (475 B.C.) in retirement, a neglected and disappointed man. Neither did the efforts of Laon-tsze, who was a few years senior to Confucius, or of Mo-cze, who succeeded him after an interval of 107 years, meet with any better success. Disorder was rife throughout the land, and the authority of the central Government was on the wane.

Signs now began to appear foreshadowing the fall of the dynasty. During the reign of Wei-lee Wang, the brazen vessels upon which Yu had engraved the different provinces of the empire were observed to shake violently and shortly afterwards a mountain fell across the stream of the Yellow River causing a wide-spread inundation. As the empire became weakened by internal dissensions so much the more did the power of the neighbouring states increase. Of these the most important was that of Tsin, on the north-west, which, when it became evident that the kingdom of Chow must fall to pieces, took a prominent part in the wars undertaken by Tsao on the south and Tsin on the north for the coveted prize. But the struggle was an unequal one. The superiority of Tsin in point of size, and in the number of fighting-men at its command, carried all before it, and in 255 B.C. Chaou-seang Wang, having silenced his rivals, possessed himself of the imperial states. Thus fell the Chow dynasty, during the existence of which the empire may have said to have been extended from the 33d to the 38th parallels of latitude, and from the 106th to the 119th degree of longitude, that is to say, it included the southern portions of the province of Chih-li, Shan-se, and Shen-se, the northern portions of Ho-nan and Keang-soo, and the western half of Shan-tung. The capital was fixed at Chang-gan Hsen in Shen-se. But though virtually emperor, Chaou-seang Wang abstained from adopting the imperial title, and he died in 251 B.C., leaving his son Heaou-wan Wang to succeed him. Scarcely was this sovereign seated on the throne when he was attacked with a fatal illness, and after a reign of but three days he became "a guest in heaven," and Chang-seang Wang his son reigned in his stead. The only title to fame possessed by this monarch was that he was the father of one of the greatest rulers China has ever had. As he was himself a man of no mark, it was probably fortunate for the country that he occupied the throne for only three years, and at the end of that time (246 B.C.) he yielded up his earthly honours to Che Hwang-te, "the first universal emperor." This sovereign was but thirteen years of age when he ascended the throne, but young as he was he speedily made his influence everywhere felt. He chose Hsen-yang, the modern Se-gan Foo, as his capital, and built there a magnificent palace, which was the wonder and admiration of his contemporaries. He constructed roads through the empire, he formed canals and erected numerous and handsome public buildings. Having by these and other means settled the internal affairs of his kingdom, he turned his attention to the enemies beyond his frontier. Chief among these were the Hwang-noo Tatars, whose attacks had for years kept the Chinese and neighbouring principalities in a state of disquiet. Against these foes he marched with an army of 300,000 men and completely routed them, exterminating those in the neighbourhood of China, and driving the rest into the mountains of Mongolia. He had no sooner returned from this campaign than he was called upon to face a formidable rebellion in Ho-nan, which had been set on foot by the adherents of the feudal princes, all of whom he had dispossessed when he reconstructed the empire on the monarchical principle. Against these rebels he was as successful as he had been against the Hwang-noo,

and as soon as peace was restored he marched southwards to subdue the tribes on the south of the Nan-shan ranges, that is to say the inhabitants of the modern provinces of Fuh-keen, Kwang-tung, and Kwang-se. Having accomplished this vast undertaking, he returned to his capital to administer the empire he had won, the limits of which were as nearly as possible those of modern China proper. One monument remains to the present day to bear witness to his enterprising energy. Finding that the northern states of Tsin, Chao, and Yen were building lines of fortification along their northern frontier for protection against the incursions of the Heung-noo, he conceived the idea of building one gigantic wall, which was to stretch across the whole northern limit of the huge empire from the sea to the furthest western corner of the modern province of Kan-suh. This work was begun under his immediate supervision in 214 B.C., but though it was energetically proceeded with, he died before it was completed. Notwithstanding all that he had done for the country he was very unpopular with the upper classes. He was a reformer, and reformers were as distasteful to the Chinamen of that time as to those of to-day, and schoolmen and pedants were for ever holding up to the admiration of the people the heroes of the feudal times and the advantages of the system they administered. This doctrine was full of danger to the state, and Che Hwang-te therefore determined to break once and for all with the past. To this end he ordered the destruction of all books having reference to the past history of the empire. This decree was almost universally carried out, and many scholars were put to death for failing in obedience to it. The measure, however, widened the breach between the emperor and the upper classes, and when, on his death, in 210 B.C., his son Urh-she Hwang-te ascended the throne, the wide-spread discontent broke out into tumults. Taking advantage of the confusion which thus arose, the princes who had been dispossessed by Che Hwang-te again attempted to regain the thrones they had lost. Unlike his father, Urh-she Hwang-te was quite unable to grapple with troublous times. He was a weak and debauched youth, and was murdered after having offered a feeble resistance to his enemies. His son Tsze-yung thereupon surrendered himself to Lew Pang, one of the two generals, who at that time were the leaders of the rebellion. Unfortunately, however, he afterwards fell into the hands of Heang Yu, the other chieftain, who was as blood-thirsty as Lew Pang was merciful, and who instantly put him to death along with all his family and associates. The rivalry between these two chieftains broke out into open warfare almost immediately after this event, on Heang Yu usurping to himself imperial honours. For five years war raged between the two combatants, and at the end of that time Lew Pang was left master of the field after a decisive battle before Woo-keang, in which Heang Yu was slain. Lew Pang was then proclaimed emperor (206 B.C.) under the title of Kaou-te, and the new line was styled the Han dynasty.

On ascending the throne Kaou-te established his capital at Lo-yang in Ho-nan, and afterwards removed it to Chang-gan in Shen-se. Having founded his right to rebel on the oppressive nature of the laws promulgated by Che Hwang-te, he abolished the ordinances of Tsin, with the exception of that referring to the destruction of the books—for, like his great predecessor, he dreaded the influence exercised by the *Literati*—and he exchanged the worship of the gods of the soil of Tsin for that of those of Han, his native state. His successor, however, gave every encouragement to literature, and appointed a commission to restore as far as possible the texts which had been destroyed by Che Hwang-te. In this the commission

was very successful. It was discovered that in many cases the law had been evaded, and numerous books which had ceased to have any corporeal being were found to exist on the tablets of the memories of scholars. This new period of literary activity added to the general prosperity of the empire. There was peace within its borders, and its frontiers remained unchallenged, except occasionally by the Heung-noo, who suffered many and severe defeats at the hands of the Chinese generals. Thwarted, therefore, in their attacks on China, these incorrigible marauders turned their attention to the kingdom of Yu-ché, which had grown up in the western extremity of Shen-se, and after much fighting drove their victims along the Teen-shan nan-loo to modern Western Tartary, that is to say, the territory between Turkestan and the Caspian Sea. This position of affairs suggested to the emperor the idea of forming an offensive and defensive alliance with the Yu-ché against the Heung-noo. With this object an ambassador was sent to Western Tartary, who, after having been twice imprisoned by the Heung-noo, returned with no more beneficial result than that his embassy was the means of introducing silk into Europe. However, in 121 B.C., the reigning emperor, Woo-te, sent an expedition against the Heung-noo, and completely defeated them. The conquered people tendered their submission to the victors, and the Chinese established colonies, built towns, and appointed governors in the vanquished provinces. From this time the power of the Heung-noo began to wane. Dissension broke out among their different chieftains, and in 93 A.D. they were completely driven out of Eastern Asia, and the 3d century witnessed their flight into the district north-east of the Caspian Sea, now occupied by the Kirghese, a broken and impotent remnant. Few Chinese dynasties have lasted much more than two centuries, and the first Han dynasty was no exception to the rule. About the beginning of the Christian era a notable rebel, one Wang Mang, rose in revolt against the infant successor of Ping-te (1 A.D.), and in 9 A.D. proclaimed himself emperor. He, however, at best only gained the suffrages of a portion of the nation, and before long his oppressive acts estranged even these supporters from him. In 23 A.D. Lew Sew headed a formidable rising against him and completely defeated him. He was destined, however, to die by the hands of his followers. In a revolt of his remaining troops his head was struck from his shoulders, and his body was torn in pieces by his own soldiery.

His opponent, Lew Sew, was now proclaimed emperor under the title of Kwang-woo-te, and in consequence of his fixing on Lo-yang in Ho-nan as his capital, the line of which he was the first emperor became known as the Eastern Han dynasty. Within this period are embraced some of the most remarkable events in the history of China. During the reign of his successor Ming-te, 65 A.D., Buddhism was introduced from India into China, and about the same time the celebrated General Pan Chao was sent on an embassy to the king of Shen-shen, a small state of Turkestan, near the modern Pichan. So successful was he in his mission, that before long he added the states of Shen-shen, Khoten, Kuché, and Kashgar as apanages to the Chinese crown. But in accordance with precedent, after a time the glory of the dynasty became dimmed. Disturbances occurred in the provinces, and, in 173, a virulent pestilence broke out which held possession of the country for eleven years. A magical cure for this plague was said to have been discovered by a Taoist priest named Chang Keo, who made so good a use of his discovery that in a single month he had gained a sufficiently large following to enable him to gain possession of the northern provinces of the empire. He was, however, opposed and

defeated by Tsaou Tsaou, another aspirant to imperial honours, whose son, Tsaou Poi, on the death of Heen-to (220 A.D.), proclaimed himself emperor, adopting the title of Wei as the appellation of his dynasty. But at the same time there were two other Richmonds in the field, Lew Pei and Sun Kenen, and the strength of these three adventurers were so nearly equal that they agreed to divide the empire between them. Tsaou-Pei, under the title of Wän-te, ruled over the kingdom of Wei (220), which occupied the whole of the central and northern portion of China. Lew Pei established the Shuh Han dynasty in the modern province of Sze-chuen (221), and called himself Chaou-jê-to; and to Sun Kenen Khan fell the southern provinces of the empire, from the Yang-tze Keang south-wards, including the modern Tonquin, which he formed into the kingdom of Woo with Nan-king for his capital, and adopted for himself the imperial style of Tn-to (222 A.D.)

But China during the period of the "Three Kingdoms" was a house divided against itself. Rivalries, the seeds of which had been sown at the time of the partition of territory, broke out more fiercely as soon as the courts were established. Lew Pei, as a descendant of the house of Han, looked upon himself as the rightful sovereign of the whole empire, and he despatched an army under the command of the celebrated general Choo-ko Leang to support his claims. This army was met by an opposing force under the Wei commander Sze-ma E, of whom Chinese historians say that "he led armies like a god," and who, by adopting a Fabian policy, completely discomfited his adversary. But the close of this campaign brought no peace to the country. Wars became chronic, and by degrees the reins of power slipped out of the hands of emperors into those of their generals. Foremost among these were the members of the Sze-ma family of Wei. Sze-ma E left a son, Sze-ma Chaou, scarcely less distinguished than he was himself, and when Sze-ma Chaou was gathered to his fathers his honours descended to Sze-ma Yen, who, finding the country ripe for a change, deposed the ruling sovereign of Wei, and proclaimed himself emperor of China (265 A.D.) His dynasty he styled the Western Tsin dynasty, and he adopted for himself the title of Woo-te. The most noticeable event in this reign was the advent of the ambassadors of the Emperor Theodosius in 284. For some years the neighbouring states appear to have transferred their allegiance from the House of Wei to that of Tsin. But the condition of China at this time was such that no government could stand unless administered by an able and powerful chief. Woo-te's successors failing to fulfil these conditions, the country soon fell again into disorder. The Heung-noo, encouraged by the decadence of the Chinese power, renewed incursions into the empire at the beginning of the 4th century, and in the confusion which followed on these attacks from without as well as those that were distracting the country from within, an adventurer named Lew Yuen established himself (in 311) as emperor, first at Ping-yang in Shan-se and afterwards in Lo-yang and Chang-gan. The history of this period is very chaotic. Numerous states sprung up into existence, some founded by the Heung-noo, and others by the Seen-po tribe, a Tungusic clan inhabiting a territory to the north of China, and who afterwards established the Leao dynasty in China. The hand of every man was against his neighbour. Nothing was lasting; and in 419 the Eastern Tsin dynasty, which had dragged on a chequered existence for nearly a century, came to an end, and with it disappeared for close on two hundred years all semblance of united authority. The country became divided into two parts, the north and the south. In the north four families reigned successively, two of which

were of Seen-po origin, viz., the Wei and the How Chow, the other two, the Pih Tse and the How Leang, being Chinese. In the south five different houses supplied rulers, who were all of Chinese descent.

This period of disorder was brought to a close by the establishment of the Sui dynasty (590). Among the officials of the ephemeral dynasty of Chow was one Yang Keen, who on his daughter becoming empress (578) was created duke of Sui. Meanwhile, he waited for an opportunity to overturn the reigning house, and, as has so often happened in the history of China, he had not long to wait. The last of the house of Chin was as weak and profligate as any of his predecessors. Him Yang Keen deposed and immediately ascended the throne (590). The country, weary of contention, was only too glad to acknowledge his undivided authority; and during the sixteen years of his reign the internal affairs of China were comparatively peaceably and prosperously administered. The emperor instituted a new and improved code of laws, and showed his respect for literature by adding 5000 volumes to the 10,000 which composed the imperial library. Abroad, his policy was equally successful. He defeated the Tatars and chastised the Koreans, who were disposed to throw aside his authority. The only scene of disorder was in his own household. His sons were unruly and violent, and after his death, in 604, his second son forced the heir to the throne to strangle himself, and then instantly assumed the imperial yellow. At first this usurper, Yang-to, gave himself up to every species of debauchery, but wearying of sensual lusts, he was seized with a desire for conquest. He sent expeditions against the Tatars, and regained some of the influence which had formerly belonged to China in Central Asia. He himself headed an expedition against the Onigours at the same time that one of his generals annexed the Lew Kow Island to the imperial crown. During his reign the volumes in the imperial library were increased to 54,000, and he spent vast sums in erecting a magnificent palace at Lo-yang, and in constructing unprofitable canals. These and other extravagances laid so heavy a burden on the country that discontent began again to prevail, and on the emperor's return from a successful expedition against the Koreans, he found the empire divided into rebellious factions. In the turmoil which followed General Le Yuen rose to the surface, and on the death of the emperor by assassination this man set Kang-to, the rightful heir, on the throne (617) until such time as he should have matured his schemes. In the following year a dose of poison vacated the throne, and Le Yuen forthwith assumed the imperial sceptre, and proclaimed himself as Tai-tsung the first emperor of the Tang dynasty. At this time the Turks were at the height of their power in Asia, and Tai-tsung was glad to purchase their alliance with money as the Emperor Justinian had been in 558. But divisions weakened the power of this mighty horde, and Tai-tsung, taking advantage of the opportunity, regained much of the position in Central Asia which had formerly been held by China. In 640, Hamil, Turfan, and the rest of the Ouigour territory were again included within the Chinese frontier, and four military governorships were appointed in Central Asia, viz., at Kuché, Khoten, Kharastan, and Kashgur. At the same time the frontier was extended as far as Eastern Persia and the Caspian Sea. So great was now the fame of China, that ambassadors from Nepal, Magadha, Persia, and Rome (643) came to pay their court to the Great Khan. Before this time, in 635, a Nestorian priest, O-lo-peon by name, arrived from Rome, who so ingratiated himself with the emperor that he built for him a church, and appointed twenty priests to perform the services. Subsequently, on the death of Tai-tsung (649), we find the strange phenomenon of the imperial power seized upon by

a woman in a country where women were regarded as little else than slaves. On the accession of Kaou-tsung (650) his wife, Woo How, gained supreme influence in the management of affairs, and on the death of her husband in 683 she set aside his lawful successor, Chung-tsung, and took possession of the throne. Nor was she unequal to the office she had usurped. She governed the empire with discretion, and her armies defeated the Tibetans, who had latterly gained possession of Kuehé, Khoten, and Kashgar. Thus she re-established the imperial government in the west, and her generals proved themselves victorious over the Khitan in the north-east. On her death, in 705, Chung-tsung partially left the obscurity in which he had lived during his mother's reign. But his wife, desiring to play a similar rôle to that enjoyed by her mother-in-law, poisoned him and set his son, Juy-tsung (710), on the throne. This monarch, who was weak and vicious, reigned but three years, and was succeeded by Yuen-tsung (713), who was in some respects an enlightened and able prince. He busied himself with introducing reform into the administration of the empire, and encouraged literature and learning with wisdom and discretion. During his reign the king of Khokand applied to him for aid against the Tibetans and Arabs, who were advancing to attack him. Yuen-tsung promptly sent an army to his succour, and the aggressors were completely defeated. In a war with the Khitans in the north-east he was not so successful; and in the disorder which arose in consequence of the invasion of the northern provinces by these formidable neighbours, General Gan Luh-shan, an officer of Turkish descent, placed himself at the head of a revolt, and having secured Tung-kwan on the Yellow River, advanced on Chang-gan. In this emergency the emperor fled, and placed his son, Suh-tsung, on the throne (756). This sovereign summoned to his aid the forces of the kings of Khoten and Khokand, of the state of Bokhara, of the Ouigours, and of the Arabs, and with these allies he completely defeated Gan Luh-shan and suppressed the rebellion. The promise held out by this energetic beginning of his reign was not fulfilled by his later career. He fell under the influence of the women and eunuchs of his harem, and died unregretted in 762. During the following reigns the Tibetans made constant incursions into the western provinces of the empire, and Tai-tsung (763-780), was compelled to purchase the assistance of the Ouigours against those intruders by giving a Chinese princess as wife to the Khan. At this epoch the eunuchs of the palace succeeded in gaining an unwonted degree of power, and several of the subsequent emperors fell victims to their plots.

The history of this and the following century is for the most part a monotonous record of feeble Governments, low and vicious intrigues, oppressions, and rebellions. Almost the only relief in the constant rounds of these scenes towards the close of the Tang dynasty was the iconoclastic policy of Woo-tsung (841-847). Viewing the increase of monasteries and ecclesiastical establishments as an evil, he abolished all temples, closed the monasteries and nunneries, and sent the inmates back to their families. Foreign priests were subjected to the same repressive legislation, and Christians, Buddhists, and Magi were bidden to turn their faces westward in the direction of the places from whence they came. With his death terminated also this policy. Buddhism again revived during the reign of the Emperor E-tsung (860-874), who, having had the honour to discover a bone of Buddha, brought it to the capital in great state. By constant internal dissensions and outbreaks the empire became so weakened that the prince of Leang found no difficulty in gaining possession of the throne, and in 907 he assumed the imperial yellow with the title of

Tai-tsoo, the first emperor of the later Leang dynasty. Thus ended the Tang dynasty, which is regarded as being the Golden Age of literature.

Five dynasties, viz., the Later Leang, the Later Tang, the Later Tsin, the Later Han, and the Later Chow followed each other in quick succession between the years 907 and 960. But though the monarchs of these lines nominally held sway over the empire, their real power was confined to very narrow limits. The disorders which were rife during the time when the Tang dynasty was tottering to its fall fostered the development of independent states, and so arose Leang in Ho-nan and Shan-tung, Ke in Shen-se, Hwai-nan in Keang-nan, Chow in Sze-chuen and parts of Shen-se and Hoo-kwang, Woo-yuë in Chê-keang, Tsoo and King-nan in Hoo-kwang, Ling-nan in Kwang-tung, and the Ouigours in Tangout.

A partial end was made to this recognized disorganization when, in 960, General Chaou Kwang-yin was proclaimed by acclamation of the army emperor in succession to the youthful Kung-te, who was compelled to vacate the throne to make way for his quondam lieutenant. The circumstances of the time justified the exchange. It required a strong hand to weld together again the different parts into which the empire had been divided, and to resist the attacks of the Khitan Tatars, whose rule at this period extended over the whole of Manchuria and Leaou-tung. Against these aggressive neighbours Tai-tsoo né Chaou Kwang-yin directed his best efforts with varying success, and he died in 976, while the war was still being waged. His son Tai-tsung (976-997) entered on the campaign with energy, but in the end was compelled to conclude a peace with the Khitans. His successor, Chin-tsung (997-1022), descended a step lower in his dealings with them, and agreed to pay them a tribute to induce them to abstain from their incursions. Probably this tribute was not sent regularly; at all events, under Jin-tsung (1023-1064), the Khitans again threatened to invade the empire, and were only persuaded to forego their intention by the emperor promising to pay them an annual tribute of 200,000 taels of silver, besides a great quantity of silken piece goods. Neither was this arrangement long binding, and so formidable were the advances made by the Tatars in the next and following reign, that Hwuy-tsung (1101-1126) invited the Neu-che Tatars to expel the Khitans from Leaou-tung. The call was readily responded to; the service was effectually performed, but having once possessed themselves of the country they declined to yield it to the Chinese, and the result was that a still more aggressive neighbour was established on the north-eastern frontier of China. Without delay the Neu-che or Kins, as they now styled themselves, overran the provinces of Chih-li, Shen-se, Shan-se, and Ho-nan, and during the reign of Kaou-tsung (1127-1163) they advanced their conquests to the line of the Yang-tze Keang.

It was during this period that the Mongols began to acquire power in Eastern Asia, and about the beginning of the 12th century they invaded the north-western frontier of China and the principality of Hea, which at that time consisted of the modern provinces of Shen-se and Kansuh. To purchase the good-will of these subjects of Jenghiz Khan the king of Hea agreed to pay them a tribute, and gave a princess in marriage to their ruler. Hitherto the Mongols had been vassals of the Kin Tatars, but the rapid growth of their power indisposed them to remain tributaries of any monarch, and in consequence of a dispute with the Emperor Wei-chaou Wang, Jenghiz Khan determined to invade the Kin province of Leaou-tung. In this expedition he was aided by the followers of the Khitan leader Yay-lu Tsoo-tsai, and in alliance with this general he captured Leaou-yang the capital city. After an unsuc-

successful invasion of China in 1212, Jenghiz Khan renewed the attack in the following year and completely defeated the Kins. In the confusion which followed the emperor was murdered by his generals, and Seuen-tung ascended the throne. But the change of ruler brought no better fortune to the Kin cause. Jenghiz Khan divided his armies into four divisions, and made a general advance southwards. With resistless force his soldiers swept over the provinces of Ho-nan, Chih-li, and Shan-tung, destroying in their course upwards of ninety cities, and spreading desolation everywhere. It was their boast that a horseman might ride without stumbling over the sites where those cities had stood. Panic-stricken by the danger which threatened him, the emperor moved his court to Kai-fung Foo, much against the advice of his ministers, who foresaw the disastrous effect this retreat would have on the fortunes of Kin. And now, as foes advanced, friends fell off from the tottering house. The state of Sung, which up to this time had paid tribute, now declined to recognize Kin as its feudal chief, and a short time afterwards declared war against its quondam ally. Meanwhile, in 1215, Yay-lu Tsoo-tsai advanced into China by the Shan-hai Kwan, and made himself master of Peking, which until then was one of the few cities in Chih-li which remained to Kin. After this victory his nobles wished him to proclaim himself emperor, but he refused, being mindful of an oath which he had sworn to Jenghiz Khan. In 1216 Tung-kwan, a pass in the mountains between the frontier of Ho-nan and Shen-se, which in the history of China has been the scene of numerous dynastic battles, forming as it does the only gateway between Eastern and Western China, was taken by the invaders. Year after year the war dragged on, the resistance offered by the Kins growing weaker and weaker. In 1220 Tse-nan Foo the capital of Shan-tung was taken, and five years later Jenghiz Khan marched an army westward into Hen and completely conquered the forces of the king; but it was not until the year following the king's death that he took possession of the principality. In the succeeding year Jenghiz Khan himself was gathered to his fathers, and Ogdai his son reigned in his stead.

Thus died at the age of 66 this great general, whose armies had triumphed victoriously over the whole of Central Asia, from the Caspian Sea and the Indus to Corea and the Yang-tsze Keang. With his dying breath he adjured his son to complete the conquest of China, and with a view to this, the crowning desire of his life, he declined to nominate either of the two eldest sons who had been born to his Chinese wives as his heir, but choose rather his third son Ogdai whose mother was a Tatar. On hearing of the death of Jenghiz Khan the Kins sent an embassy to his successor desiring peace, but Ogdai, remembering the last injunctions of his father, told them there would be no peace for them until their dynasty should be overthrown. Up to this time the Mongols had been without any code of laws. The old rule

"That they should take who have the power,
And they should keep who can,"

was the maxim on which they guided their mutual intercourse, and the punishments due for offences were left entirely to the discretion of the officials before whom the culprits were tried. The consistency, however, which had been given to the nation by the conquests of Jenghiz Khan made it necessary to establish a recognized code of laws, and one of the first acts of Ogdai was to form such a code. With the help also of Yay-lu Tsoo-tsai, he established custom houses in Chih-li, Shan-tung, Shan-se, and Leaou-tung; and for this purpose divided these provinces into ten departments. Meanwhile the war with the Kins was carried on with energy. In 1230 Se-gan Foo was taken,

and sixty important posts were captured. Two years later Too-le, brother of Ogdai, took Fung-tseang Foo and Hanchung Foo, in the flight from which last-named place 100,000 persons are said to have perished. Following the course of the River Han in his victorious career this general destroyed 140 towns and fortresses, and defeated the army of Kin at Mount San-fung.

In the following year the Mongol cause suffered a great loss by the death of Too-le. This famous warrior left behind him twelve sons, two of whom, Mangu, the first-born, and Kublai, the fourth son, were destined to sit in succession on the throne of their uncle Ogdai. But their time was not yet. First of all they had to win their spurs, and well did they prove by their deeds their right to the name of Mongol or "daring." In China, in Central Asia, and on the banks of the Caspian they led their victorious armies. But meanwhile, in 1232, the Mongols made an alliance with the state of Sung, by which, on condition of Sung helping to destroy Kin, Ho-nan was to be the property of Sung for ever. The effect of this coalition soon became apparent. Barely had the Kin emperor retreated from Kai-fung Foo to Joo-ning Foo in Ho-nan when the former place fell into the hands of the allies. Next fell Loyang, and the victorious generals then marched on to besiege Joo-ning Foo. The presence of the emperor gave energy to the defenders, and they held out until every animal in the city had been killed for food, until every old and useless person had suffered death to lessen the number of hungry mouths, until so many able-bodied men had fallen by the hand of the enemy that the women manned the ramparts, and then the allies stormed the walls. Once inside the town the inhabitants, enfeebled by starvation, fell ready victims to their swords. The emperor, like another Sardanapalus, despairing now of success, burned himself to death in his palace, that his body might not fall into the hands of his enemies. For a few days the shadow of the imperial crown rested on the head of his heir Changlin, but in a tumult which broke out amongst his followers he lost his life, and with him ended the "Golden" dynasty, which from that time disappeared from the country's annals until the Manchoo family now reigning came, nearly four centuries later, to claim the throne as heirs of the defender of Joo-ning Foo.

Although China was still by no means conquered, yet the extinction of the Kin dynasty enabled Ogdai to send an army of 300,000 men to ravage the country bordering on the Caspian Sea. But so vast were the resources at his command, that he was able to despatch at the same time a force 600,000 strong into Sze-chuen to subdue the power of Sung in that province. For, notwithstanding the treaty which had been made between Ogdai and Sung, no sooner were the spoils of Kin to be divided than fierce war broke out again between them, in prosecuting which the Mongol armies swept over the provinces of Hoo-kwang, Keang-nau, and Ho-nan, and were checked only when they reached the walls of Leo-chew Foo in Gan-hwuy. Ogdai was not destined to live to see his sway acknowledged over the whole empire. In 1241, he died at the age of fifty-six, having reigned thirteen years, and was nominally succeeded by his grandson Cheliemen. But among the numerous ladies who called Ogdai lord, was one named Teliakona, who on the death of the emperor took possession of the throne, and after exercising rule for four years, established her son Kwei-yew, as Great Khan. But in 1248 his life was cut short, and the nobles, disregarding the claims of Cheliemen, proclaimed as emperor Mangu, the eldest son of Too-le. Under this monarch the war against Sung was carried on with energy, and Kublai, on stripping the bounds of Sung territory, made his way into the province of Yun-nan, which at that time was divided into a

number of independent states, and having attached them to his brother's crown he passed on into Tibet, Tonquin, and Cochinchina, and from thence striking northwards entered the province of Kwang-se. On the death of Mangu in 1259 Kublai ascended the throne, and never in the history of China was the nation more illustrious, nor its power more widely felt, than under his sovereignty. During the first twenty years of his reign Sung kept up a resistance, gradually growing weaker and weaker, against his authority; and it was not, therefore, until 1280 that he assumed complete jurisdiction as emperor of China. At this time his authority was acknowledged "from the Frozen Sea, almost to the Straits of Malacca. With the exception of Hindustan, Arabia, and the westernmost parts of Asia, all the Mongol princes as far as the Dnieper declared themselves his vassals, and brought regularly their tribute." It was during this reign that Marco Polo visited China, and he describes in glowing colours the virtues and glories of the "Great Khan." But though his rule was characterized by discretion and munificence, his Chinese subjects were uneasy under his yoke. He undertook public works, he patronized literature, and relieved the distress of the poor, but still they never forgot that he was an alien and a barbarian, and he died unregretted in 1294. His son had died during his lifetime, and after some contention his grandson Timur ascended the throne under the title of Yuen-ching. After an uneventful reign this prince was gathered to his fathers in 1307, and as he left no son, Woo-tsung, a Mongol prince, reigned in his stead. To him, succeeded Jin-tsung in 1311, who made himself conspicuous by the honour he showed to the memory of Confucius, and by distributing offices more equally between Mongols and Chinese than had hitherto been done. This act of justice gave great satisfaction to the Chinese, and his death ended a peaceful and prosperous reign in 1320. Three years later,—three years of disorder,—his successor, Ying-tsung, was murdered by a band of conspirators. From this time the star of the Yuen dynasty was in the descendant. Tai-ting-te, Ming-tsung, Wan-te, and Shun-te followed one another on the throne in quick succession. Each reign was more troublous than the last, and in the person of Shun-te (1333-1368) were summed up all the vices and faults of his predecessors. Outbreaks, which up to his time had been local in their character, assumed large and threatening proportions; and finally this descendant of Jenghiz Khan was compelled to fly from his capital before Choo Yuen-chang, the son of a Chinese labouring man. Deserted by his followers he sought refuge in Ying-chang Foo, and there the last of the Yuen dynasty died. So disunited had the empire become by constant disturbances and rebellions, that Choo Yuen-chang met with little opposition to his forces, more especially as his first care on becoming possessed of a district was to suppress lawlessness and to establish a settled government. In 1355 he crossed the Yang-tze Keang and captured Nan-king, in consequence of which success he proclaimed himself duke of Woo, but as yet he carefully avoided adopting any of the insignia of royalty. Even when he had taken the capital and was the master of the empire thirteen years later, he still professed to dislike the idea of assuming the imperial title. His scruples, however, on this point were overcome, and he solemnly declared himself emperor in 1368. Once seated upon the throne, he ingratiated himself with his subjects by his generous treatment of his enemies, and by the regard he showed for the welfare of his people. He carried his arms into Tatar, where he subdued the last semblance of Mongol power in that direction, and then bent his steps towards Leaou-tung. Here the Mongols defended themselves with the bravery of despair, but

nothing could resist the onslaught of the victorious Chinese, and the conquest of this province left Hung-woo, as the founder of the new or Ming, "Bright," dynasty styled himself, without a foe in the empire. Beyond the frontier of China he cultivated friendly relations with the rulers of the neighbouring states. The king of Corea sent an embassy to congratulate him on his accession, and the sovereign of the Lew-chew Islands sent his brothers and sons to his court to be educated. As a quondam Buddhist priest he naturally lent his countenance to that religion to the exclusion of Taoism, whose priests had for centuries earned the contempt of all but the most ignorant by their pretended magical arts and their search after the philosopher's stone. In 1398, and in the thirtieth year of his reign, Hung-woo was gathered to his fathers, and Keen-wan his grandson reigned in his stead. Aware that the appointment of this youth—his father was dead—would give offence to the young emperor's uncles, Hung-woo dismissed them to their respective governments before death closed his eyes. This, however, only delayed the storm. The prince of Yen, his eldest surviving son, raised the banner of rebellion in his principality as soon as the news reached him of his nephew's accession, and after gaining several victories over the armies of Keen-wan he presented himself before the gates of Nanking, the capital. Treachery opened the gates to him, and the emperor having fled in the disguise of a monk, the victorious prince clothed himself in imperial yellow and took the title of Yung-lo (1403). At home Yung-lo devoted himself to the encouragement of literature and the fine arts, and, possibly from a knowledge that Keen-wan was among the Buddhist priests, he renewed the law prohibiting Buddhism. Abroad he swept Cochinchina and Tonquin within the folds of his empire and carried his arms into Tatar, where he made new conquests of waste regions, and erected a monument of his victories. His death took place in 1425, and he was in that year succeeded by his son Hung-ke.

Hung-ke's reign was short and uneventful. He did that which was right as far his knowledge went. He strove to promote only such mandarins as had proved themselves to be able and honest, and to further the welfare of the people. During the reign of his successor, Seuen-tih (1426-1436), the empire suffered the first loss of territory since the commencement of the dynasty. Cochinchina rebelled and gained her independence. But this was but the beginning of troubles. The next emperor, Ching-tung (1436) was defeated and taken prisoner by a Tatar chieftain, a descendant of the Yuen family named Ye-seen, who had invaded the northern provinces. With unusual clemency the Tatar gave him his life, though he kept him a close prisoner until the fortunes of war turned against him. Having been completely defeated by a Chinese force from Leaou-tung, Ye-seen liberated his captive, who returned to his capital amidst the rejoicings of the people, again to occupy the throne which during his imprisonment (1450-1457) had been held by his brother King-te. The two following reigns, those of Ching-hwa (1463-1488) and of Hung-che (1488-1506) were quiet and peaceful. But their successor Ching-tih (1506-1522) was called upon to face a very formidable insurrection headed by the prince of Ning. He was, however, victorious over the rebel, who lost 30,000 men in the engagement which put an end to his hopes. The disorder into which the empire had been thrown by this civil war encouraged the foreign enemies of China. First of all from the dreaded north came a Tatar army under Yen-ta in 1542, during the reign of Kea-tsung, which laid waste the province of Shen-se, and even threatened the capital, and a little later a Japanese fleet appeared off the coast and carried fire and sword through the littoral provinces. Ill-blood had arisen between the

two peoples before this, and a Japanese colony had been driven out of Ningpo by force and not without bloodshed a few years previously. Kea-ting was not equal to such emergencies, and his death, which took place in 1567, would have been an advantage to the empire, had his son been a more able prince. But the only weapon Lung-king (1567-1573) was able to wield against the Tatar Yen-ta was a bribe. He made him a prince of the empire, and gave him certain commercial privileges, which were further supplemented by the succeeding emperor Wan-jeh (1573-1620) by a grant of land in Shen-se. During the reign of this sovereign, in the year 1592, the Japanese successfully invaded Corea, and Taikessan, the emperor of Japan, was on the point of proclaiming himself king of the peninsula, when a large Chinese force answering to the invitation of the king, appeared on the field and completely routed the Japanese army, at the same time that the Chinese fleet cut off their retreat by sea. In this extremity the Japanese sued for peace, and sent an embassy to Peking to arrange terms. But the peace was of short duration. In 1597 the Japanese again invaded Corea and defeated the Chinese army which was sent against them, nor were they less successful at sea. They destroyed the Chinese fleet and ravaged the coast. Suddenly, however, when in the full tide of conquest, they evacuated Corea, which again fell under the direction of China. Four years later Ricci arrived at the Chinese court; and though at first the emperor was inclined to send him out of the country, his abilities gradually won for him the esteem of the sovereign and his ministers, and he remained the scientific adviser of the court until his death in 1610. About this time the power which was destined to overthrow the Ming dynasty began to grow restless. The Manchoo Tatars, goaded into war by the injustice they were constantly receiving at the hands of the Chinese, led an army into China in 1616 and completely defeated the force which was sent against them. Three years later they were again victorious over the Chinese, and they then gained possession of the province of Leaou-tung. This final series of disasters was more than the emperor could bear, and he died of a broken heart in 1620.

In the same year Teen-ning, the Manchoo sovereign, having declared himself independent, and possessed himself of Leaou-tung, moved the court to San-koo, to the east of Monkden, which, five years later, he made his capital. Meanwhile Tai-chang, the son of Wan-jeh, ascended the Chinese throne, but barely had he assumed the reins of power when he fell ill. Acting on the advice of his doctors he drank of the liquor of immortality and died. The next emperor Teen-ke, after a brief and troublous reign, followed him to the grave in 1627, and to him succeeded Tsing-ching, the last emperor of the Ming dynasty. In his reign the storm-clouds, which had been collecting for some years, burst over the empire. In addition to the threatened danger on the north, rebel bands, enriched by plunder, and grown bold by success, began to assume the proportion of armies. They dominated over whole districts and provinces and paralyzed the imperial forces by their energy and daring. Out of this seething mass of insubordination two leaders showed themselves conspicuously. These were Lo Tsze-ching and Shang Ko-he. In order that there should be no dispute as to which should be greatest, they decided to divide the empire between them, and to begin with it was agreed that Shang should take possession of Sze-chuen and Ho-kwang, and that Lo should make himself master of Ho-nan. Bent on this mission Lo besieged Kaifung Foo, the capital of the province, and so long and closely did he beleaguere it that in the consequent famine human flesh was regularly sold in the market. At length an imperial force came to raise the

siege, with consequences as fatal to the inhabitants as if the rebels had gained the city; for, fearful of meeting Lo's army in the field, they cut through the dykes of the Yellow River, "China's Sorrow," and flooded the whole country including the city. The rebels escaped to the mountains, but upwards of 200,000 inhabitants perished in the flood, and the city became a heap of ruins (1642). From Kaifung Foo Lo marched against the other strongholds of Ho-nan and Shen-se, and was so completely successful that he determined to attack Peking. A treacherous eunuch opened the gates to him, on being informed of which the emperor committed suicide. When the news of this disaster reached the general-commanding on the frontier of Manchoo Tatory, he, in an unguarded moment, concluded a peace with the Manchoes, and invited them to dispossess the rebel Lo Tsze-ching. With ready acquiescence the Manchoes entered China, and after defeating a rebel army sent against them, they marched towards Peking. On hearing of the approach of the invaders, Lo Tsze-ching, after having set fire to the imperial palace, evacuated the city, but was overtaken, and his force was completely routed. The object for which the Manchoes had been introduced into the empire having now been accomplished, the Chinese wished them to retire, but, like the Mongols, having once gained a footing in the empire, they declared themselves unwilling to leave it, and having taken possession of Peking they proclaimed the ninth son of Teen-ning emperor of China under the title of Shun-chie, and adopted the name of Ta-ting, or "Great pure," for the dynasty (1644). Meanwhile the mandarins at Nanking had chosen an imperial prince to ascend the throne. But with all the prestige of victory the Tatars bore down all opposition, and at this most inopportune moment "a claimant" to the throne, in the person of a pretended son of the last emperor, appeared at court. This additional complication still further reduced the Chinese power of acting. While this contention prevailed inside Nanking the Tatar army appeared at the walls. But there was no need for them to use force. The gates were thrown open, and they took possession of the city without shedding a drop of blood. Following the conciliatory policy they had everywhere pursued, they confirmed the mandarins in their offices and granted a general amnesty to all who would lay down their arms. As the Tatars entered the city the emperor left it, and after wandering about for some days in great misery, he threw himself into the Yang-tze Keang and was drowned. Thus ended the Ming dynasty, and the empire passed again under a foreign yoke.

All accounts agree in stating that the Manchoe conquerors are descendants of a branch of the family which gave the Kin dynasty to the north of China; and in lieu of any authentic account of their early history, native writers have thrown a cloud of fable over their origin. These tell us that in remote ages three heaven-born virgins dwelt beneath the shadow of the Great White mountains, and that while they were bathing in a lake which reflected in its bosom the snow-clad peaks which towered above it, a magpie dropped a blood-red fruit on the clothes of the youngest. This the maiden instinctively devoured, and forthwith conceived and bore a son, whose name they called Ai-sin Ghioro, which being interpreted is the "Golden Family Stem," and which is the family name of the present emperors of China. When his mother had entered the icy cave of the dead, her son embarked on a little boat and floated down the River Harka until he reached a district occupied by three families who were at war with each other. The personal appearance of the supernatural youth so impressed these warlike chiefs that they forgot their enmities and hailed him as their ruler. The town of

O-to-le (43° 35' N. lat. and 128° E. long.) was chosen as his capital, and from that day his people waxed fat, and at length, as we have seen, kicked against their oppressors, the Chinese.

This legend confirms the general belief that the original seat of the Manchooks was in the valley of the Hurka, a river which flows into the Sungari in about 46° 20' N. lat., and 129° 50' E. long. Under a succession of able and hardy chiefs they added land to land and tribe to tribe, until, in the 16th century, we find them able to cope with, and in a position to demand favourable terms by treaty from, their Chinese neighbours. As they became more powerful their complaints became louder against acts of aggressive oppression which they laid at the door of the Mings. But who will say that the fault was all on one side? Doubtless the Mings tried to check their ambition by cruel reprisals—a mistaken policy common to oppressors who find themselves with waning powers in the presence of growing discontent. But if we are to square the account, against this must be put numerous Manchoo raids into Leaou-tung, entailing loss of life and property on the subjects of China. And the ready rapidity with which these Manchurian horsemen swept round the corner of the Great Wall into China proper on the fatal invitation of the Chinese general shows that they were neither unwilling nor unaccustomed to wander beyond their own frontiers.

But the accession to the throne of the Emperor Shun-che did not by any means at first restore peace to the country. In Keang-se, Fuh-keen, Kwang-tung, and Kwang-se the adherents of the Ming dynasty defended themselves vigorously but unsuccessfully against the invaders, while the pirate Ching Che-tung, the father of the celebrated Koxinga, kept up a predatory warfare against them on the coast. On one occasion he was bought over to the Tatar camp and accepted a princess as a reward for his conversion, but he soon returned to his former allegiance, only, however, once again to prove himself a turn-coat. Finding him too formidable as a foe the Tatars determined again to gain his alliance. A general's command proved too tempting a bait to the buccaneer to be refused. He accepted the offer and went on shore to visit the Tatar commander, who received him with all civility. But when the pirate wished to return to his ships he was politely urged to visit Peking. Once there he was thrown into prison, where he died shortly afterwards. His son Koxinga, warned by his father's example, determined to leave the mainland and to seek an empire elsewhere. His choice fell on Formosa, and having driven the Dutch out of the island, he established himself as king and held possession of the island until the reign of Kang-he, when he resigned in favour of the Imperial Government. Meanwhile a prince of the house of Ming was proclaimed emperor in Kwang-se, under the title of Yung-leih. But the Tatars having reduced the provinces of Fuh-keen and Keang-se, and having taken Canton after a siege of eight months, marched against and so completely routed his followers that he was compelled to fly to Pegu. There he remained for some years until, believing that his adherents in Yun-nan and Kwei-chow were sufficiently numerous to justify his raising his standard in those provinces, he crossed the frontier and advanced to meet the imperial forces. On this as on the former occasion, fortune declared against him. His army was scattered to the four winds, and he was taken prisoner and strangled. Gradually opposition to the new regime became weaker and weaker, and the shaved head with the pig-tail—the symbol of Tatar sovereignty—became more and more universally adopted. In 1651 died Ama Wang, the uncle of Shun-che, who had acted as regent during his nephew's minority, and the emperor then assumed the government of the state. Little is known of this monarch.

He appears to have taken a great interest in science, and to have patronized Adam Schaal, a German Jesuit, who was at that time resident at Peking. It was during his reign (1656) that the first Russian embassy arrived at the capital, but as the envoy declined to kowtow before the emperor he was sent back without having been admitted to an audience. After an unquiet reign of seventeen years Shun-che was gathered to his fathers (1661), and Kang-he, his son, reigned in his stead. This emperor was as renowned as his father had been unknown. He was indefatigable in administering the affairs of the empire, and at the same time he devoted much of his time to literary and scientific studies under the guidance of the Jesuits. The dictionary of the Chinese language, published under his superintendence, proves him to have been as great a scholar as his conquests over Eleuths shows him to have been famous as a general. During one of his hunting expeditions to Mongolia he caught a fatal cold, and he died in 1721 after a glorious reign of sixty years. Under his rule Tibet was added to the empire, which extended from the Siberian frontier to Cochinchina, and from the China Sea to Turkestan. Almost the only national misfortune that visited China while he sat upon the throne was an earthquake at Peking, in which 400,000 people are said to have perished.

Kang-he was succeeded by Yung-ching, who, reaping the benefits of his father's vigorous administration, enjoyed a peaceable reign, though a short one. He died in 1735, and Keen-lung his son reigned in his room. Ambitious and warlike, this monarch despised the conciliatory measures by which his father had maintained peace with his neighbours. On but a slight provocation, he marched an army into Ili, which he converted into a Chinese province, and he afterwards added eastern Turkestan to the far-reaching territories of China. Twice he invaded Burmah, and once he penetrated into Cochinchina, but in neither country were his arms successful. He is accused of great cruelty towards his subjects, which they repaid by rebelling against him. During his reign it was that the Mahometan standard was first raised in Kansuh. But the Mussulmans were unable to stand against the imperial troops; their armies were dispersed; ten thousand of them were exiled; and, effectually to prevent a renewal of the outbreak for some years, an order was issued that every Mahometan in Kansuh above the age of fifteen should be put to death (1784). Amidst all the political calls upon his time Keen-lung still found leisure for study. He wrote incessantly, both poetry and prose, and did much to promote the cause of literature by collecting libraries and republishing works of value. His campaigns furnished him with themes for his verses, and in the Summer Palace was found a handsome manuscript copy of a laudatory poem he composed on the occasion of his war against the Gorkhas. This was one of the most successful of his military undertakings. His generals marched 70,000 men into Nepal to within sixty miles of the British frontiers, and having subjugated the Gorkhas they received the submission of the Nepanlese, and acquired an additional hold over Tibet (1792). In other directions his arms were not so successful. We find no poem commemorating the campaign against the rebellious Formosans, nor lament over the loss of 100,000 men in that island, and the last few years of his reign were disturbed by outbreaks among the Meaou-tsze or hill tribes, living in the mountains in the provinces of Kwei-chow and Kwang-se. In 1795, after a reign of sixty years, Keen-lung abdicated in favour of his fifteenth son, who adopted the title of Kea-king as the style of his reign. He only lived three years in retirement, and died at the age of eighty-eight in 1798.

During the reign of Keen-ling the relations of the East India Company with his Government had been the reverse of satisfactory. All kinds of unjust exactions were demanded from the merchants, and many acts of gross injustice were committed on the persons of Englishmen. So notorious, at length, did these matters become that the British Government determined to send an embassy to the court of Peking, and Lord Macartney was chosen to represent George III. on the occasion. On arriving at Jehel, where the court then was, Lord Macartney was received most graciously by the emperor, and subsequently at Yuen-ning-yuen he was admitted into the imperial presence and was treated with every courtesy. But the concessions he sought for his countrymen were not accorded to him, and in this sense, but in this sense only, his mission was a failure.

Kea-king's reign, which extended over a period of five-and-twenty years, was disturbed and disastrous. In the northern and western provinces, rebellion after rebellion broke out, due in a great measure to the carelessness and incompetency of the emperor, who was as obstinately self-opinionated as he was unfit to rule, and the coasts were infested with bands of pirates, whose number and organization enabled them for a long time to hold the imperial fleet in check. But, fortunately for the Government, dissensions broke out among the pirate chiefs, and, weakened by internal fighting, they finally made their peace with the mandarins and accepted posts under the emperor. Meanwhile the condition of the foreign merchants at Canton had in no wise improved. The mandarins were as exacting and as unjust as ever, and in order to set matters on a better footing the British Government despatched a second ambassador in the person of Lord Amherst to Peking in 1816. On arriving at the mouth of the Peiho he was received by imperial commissioners who conducted him to Yuen-ming-yuen, taking every advantage on the way of pointing out to him the necessity of his performing the kowtow before the emperor if he wished to be allowed to enter the imperial presence. This he declined to do, and he was consequently dismissed from the palace on the same day on which he arrived, and thus a new impetus was given to mandarinic insolence.

Destitute of all royal qualities, a slave to his passions, and the serrat of caprice, the emperor Kea-king died in the year 1820, after a reign of twenty-five years, leaving a disturbed country and a disaffected people as a legacy to his successor Taon-kwang.

Though possessed in his early years of considerable energy Taon-kwang no sooner ascended the throne than he turned his powers, which should have been directed to the pacification of the empire, to the pursuit of pleasure and amusement. The reforms which his subjects had been led by his first manifestoes to believe would be introduced never seriously occupied his attention, and the discontent which had been lulled by hope soon became intensified by despair. In Formosa, Kwang-se, Ho-nan, and other parts of the empire insurrections broke out, which the imperial generals were quite unequal to suppress by force, and the Triad Society, which had originated during the reign of Kang-he, again showed a formidable front under his degenerate successor. Meanwhile the hardships inflicted on the English merchants at Canton became so unbearable, that when, in 1834, the monopoly of the East India Company ceased, the English Government determined to send out a minister to superintend the foreign trade at that port. Lord Napier was selected for the office; but so vexatious was the conduct of the Chinese authorities, and so inadequately was he supported, that the anxieties of his position brought on an attack of fever, from which he died at Macao after but a few months' residence

in China. The chief cause of complaint adduced by the mandarins was the introduction of opium by the merchants, and for years they attempted by every means in their power, by stopping all foreign trade, by demands for the prohibition of the traffic in the drug, and by vigilant preventive measures, to put a stop to its importation. At length Captain Elliot, the superintendent of trade, in 1839 agreed that all the opium in the hands of Englishmen should be given up to the native authorities, and he exacted a pledge from the merchants that they would no longer deal in the drug. On the 3d April, 20,283 chests of opium were handed over to the mandarins and were by them destroyed—a sufficient proof that they were in earnest in their endeavours to suppress the traffic. This demand of commissioner Lin was considered by the English Government to amount to a *casus belli*, and in 1840 war was declared. In the same year the fleet captured Chusan, and in the following year the Bogue Ports fell, in consequence of which operations the Chinese agreed to cede Hong-Kong to the victors and to pay them an indemnity of 6,000,000 dollars. As soon as this news reached Peking, Ke Shen, who had succeeded commissioner Lin, was dismissed from his post and degraded, and Yih Shan, another Tatar, was appointed in his room. But before the new commissioner reached his post, Canton had fallen into the hands of Sir Hugh Gough, and shortly afterwards Amoy, Ningpo, Tanghai in Chusan, Chapoo, Shanghai, and Chin-keang Foo shared the same fate, and a like evil would have happened to Nanking had not the Imperial Government, dreading the loss of the "Southern Capital," proposed terms of peace. After much discussion, Sir Henry Pottinger, who had succeeded Captain Elliot, concluded, in 1842, a treaty with the imperial commissioners, by which the four additional ports of Amoy, Fuh-chow-Foo, Ningpo, and Shanghai were declared open to foreign trade, and an indemnity of 21,000,000 dollars was to be paid to the English. Nor was the remainder of the reign of Taon-kwang more fortunate than its beginning; the empire was completely disorganized, rebellions outbreaks were of frequent occurrence, and the imperial armies were powerless to oppose them. So complete was the demoralization of the troops, that on one occasion the Menou-tsze or hill tribes of Kwang-se defeated an army of 30,000 men sent against them by the viceroy of the two Kwangs. In 1850, while these clouds were hanging gloomily over the land, Taon-kwang "ascended on high," and Heen-fung, his son, reigned in his stead.

A cry was now raised for the reforms which had been hoped for under Taon-kwang, but Heen-fung possessed in an exaggerated form the selfish and tyrannical nature of his father, together with a voluptuary's craving for every kind of sensual pleasure, and he lived to reap as he had sown. For some time Kwang-so had been in a very disturbed state, and when, on the accession of the new emperor, the people found that no relief from the oppression they endured was to be given them, they broke out into open revolt and proclaimed a youth, who was said to be the representative of the last emperor of the Ming dynasty, as emperor, under the title of Teen-tih or "Heavenly Virtue." From Kwang-so the flames spread into Hoo-pih and Hoo-nan, and then languished from want of a leader and a definite political cry. Just at the moment, however, when there appeared to be a possibility that, by force of arms and the persuasive influence of money, the imperialists would re-establish their supremacy, a leader presented himself in Kwang-se, whose energy of character, combined with great political and religious enthusiasm, speedily gained for him the suffrages of the discontented. This was Hing Sew-tseuen. Seizing on the popular longing for the return of a Chinese dynasty

he proclaimed himself as sent by heaven to drive out the Tatars, and to restore in his own person the succession to China. At the same time having been converted to Christianity, and professing to abhor the vices and sins of the age, he called on all the virtuous of the land to extirpate rulers who, both in their public laws and in their private acts, were standing examples of all that was base and vile in human nature. Crowds soon flocked to his standard. Teen-tih was deserted; and, putting himself at the head of his followers, Hung Sew-tseuen marched northwards into Hoo-nan and Hoo-pih, overthrowing every force which was sent to oppose him. The first city of importance which fell into his hands was Woo-chang Foo on the Yang-tsze-Kiang, the capital of Hoo-pih. Situated at the junction of the Han River with the Yang-tsze Kiang, this city was a point of great strategical importance. But Hung Sew-tseuen was not inclined to rest upon his laurels, knowing full well that he must be able to call Nanking his before there would be any chance that his dreams of empire could be realized. Having made Woo-chang secure, he therefore moved down the river, and after taking Gan-king on his way he proceeded to the attack of Nanking. So wide-spread was the disaffection at this time throughout the country that the city was ripe for falling, and without much difficulty Hung Sew-tseuen in 1852 established himself within its walls, and proclaimed the inauguration of the Tai-ping dynasty, of which he nominated himself the first emperor under the title of Teen Wang or "Heavenly king." For the next few years it appeared as though he had nailed the flag of victory to his staff. His armies penetrated victoriously as far north as Tientsin and as far east as Chin-keang and Soochow, while bands of sympathizers with his cause appeared in the neighbourhood of Amoy. As if still further to aid and abet him in his schemes, England declared war against the Tatar dynasty in 1857, in consequence of an outrage known as the "Arrow" affair. In December of the same year Canton was taken by an English force under Sir Michael Seymour and General Straubenzee, and a still further blow was struck against the prestige of the ruling Government by the determination arrived at by Lord Elgin, who had been sent out as special ambassador, to go to Peking and communicate directly with the emperor. In May 1858 the Taku Forts were taken, and the way having thus been cleared of obstacles, Lord Elgin went up the Peiho to Tientsin *en route* for the capital. At Tientsin, however, he was met by the imperial commissioners, who persuaded him so far to alter his plans as to conclude a treaty with them on the spot, which treaty it was agreed should be ratified at Peking in the following year. When, however, Sir Frederick Bruce, who had been in the meanwhile appointed minister to the court of Peking, attempted to pass Taku to carry out this part of the arrangement, the vessels escorting him were fired on from the forts with such precision and persistency that he was compelled to return to Shanghai to await the arrival of a larger force than that which he then had at his command. As soon as news of this defeat reached England Lord Elgin was again sent out with full powers, and accompanied by a large force under the command of Sir Hope Grant. The French likewise took part in the campaign, and on 1st August 1860 the allies landed without meeting with any opposition at Peh-tang, a village twelve miles north of Taku. A few days later the forts at that place which had bid defiance to Sir Frederick Bruce twelve months previously were taken, and from thence the allies marched to Peking. Finding further resistance to be hopeless, the Chinese opened negotiations, and as a guarantee of their good faith surrendered the An-ting gate of the capital to the allies. On the 24th October the treaty of 1858 was ratified by

Prince King and Lord Elgin, and a convention was signed under the terms of which the Chinese agreed to pay a war indemnity of 8,000,000 taels. The Emperor Hien-fung did not live long to see the results of his new relations with the hated foreigner, but died in the summer of the following year, leaving the throne to his son Tung-che a child of five years old.

The conclusion of peace with the allies was the signal for a renewal of the campaign against the Tai-pings, and benefiting by the friendly feelings of the English authorities engendered by the return of amicable relations, the Chinese Government succeeded in enlisting Major Gordon of the Royal Engineers in their service. In a surprisingly short space of time this officer formed the troops, which had formerly been under the command of an American named Ward, into a formidable army, and without delay took the field against the rebels. From that day the fortunes of the Tai-pings declined. They lost city after city, and, finally in July 1864, the imperialists, after an interval of twelve years, once more gained possession of Nanking. Teen Wang did not survive the capture of his capital, and with him fell his cause. Those of his followers who escaped the sword of the victors dispersed throughout the country, and the Tai-pings ceased to be.

With the measure of peace which was then restored to the country trade rapidly revived, and, with the exception of the province of Yun-nan, where the Mahometan rebels under Suleiman still kept the imperial forces at bay, prosperity was everywhere re-awakened. Against these foes the Government was careless to take any active measures, until in 1872 Prince Hassan, the adopted son of Suleiman, was sent on a mission to England with the object of gaining the recognition of the Queen for his father's government. This step at once aroused the susceptibilities of the Imperial Government, and a large force was instantly organized and despatched to the scene of the rebellion. The war was now pushed on with vigour, and before the year was out the Mahometan capital Ta-le Foo fell into the hands of the imperialists, and the followers of Suleiman at that place and throughout the province were mercilessly exterminated. In the succeeding February the Regents—i.e., the dowager-empresses, who had governed the country since the death of Hien-fung—resigned their powers into the hands of the emperor. This long-expected time was seized upon by the foreign ministers to urge their right of audience with the emperor, and on the 29th June 1873 the privilege of gazing on the "sacred countenance" was accorded to them. From that time until his death from smallpox on the 12th of January 1875, Tung-che's name fails to appear in connection with any public act of importance.

The Emperor Tung-che having died without issue, the succession to the throne, for the first time in the annals of the Tsing dynasty, passed out of the direct line, and a cousin of the deceased emperor, a princeling, said to be not quite four years old, was chosen to reign in his room, under the title of Kwang-seu or "Succession of Glory." Thus is the country again doomed to suffer all the inconveniences of a long imperial minority, at a time, too, when events seem to show that the civilization of China has grown old, and is like to vanish away; when the introduction of new ideas and western modes of thought is about to stretch the old bottle of Confucian tradition to its fullest extent; and when, therefore, the empire will sorely need wisdom and strength at the head of affairs to guide it safely through the critical times which lie before it in the future.

THE IMPERIAL FAMILY.—The present imperial family, on gaining possession of the throne on the fall of the Ta-ming, or "Great Bright" dynasty, assumed the dynastic

title of Ta-Tsing, or "Great Pure," and the first emperor, who was styled Sho-tsu-chang Hwang-to, adopted the title of Shun-cho for his reign, which began in the year 1644. The legendary progenitor of these Manchoo rulers was Aisin Gioro, whose name is said to point to the fact of his having been related to the race of Nen-chih, or Kin, i.e., Golden Tatars, who reigned in Northern China during the 12th and 13th centuries. The present emperor, whose reign is styled Kwang-sen or "Succession of Glory," is the eighth from the founder of the dynasty, and is the only ruler since the establishment of the line who has not succeeded as a direct descendant. Kang-ho (1661-1722), for instance, was the third son of Shun-cho; Yung-ching (1722-1735) was the fourth son of Kang-ho; Keon-lung (1736-1795) was the fourth son of Yung-ching; Kea-king (1796-1820) was the fifteenth son of Keon-lung; Taou-kwang (1821-1850) was the second son of Kea-king; Heon-fung (1851-1861) was the fourth of the nine sons who were born to the emperor Taou-kwang; and Tung-che (1862-1875) was the only son of Heon-fung. As by Chinese law the heir must be younger than the individual from whom he inherits, it became necessary when the Emperor Tung-che "became a guest in Heaven," without issue, in 1875, to select as his successor one of the sons of one of his father's younger brothers, and the choice, which was recorded in his will, fell upon the infant son of the Prince of Chuu, the seventh son of the Emperor Taou-kwang.

In order to prevent the confusion which would arise among the princes of the imperial house were they each to adopt an arbitrary name, the Emperor Kang-ho decreed that each of his twenty-four sons should have a personal name consisting of two characters, the first of which should be *Yung*, and the second should be compounded with the determinative *she*, "to manifest," an arrangement which would, as has been remarked, find an exact parallel in a system by which the sons in an English family might be called Louis *Edward*, Louis *Edwin*, Louis *Edwy*, Louis *Edgar*, and so on. This device obtained also in the next generation, all the princes of which had *Hung* for their first names, and the Emperor Keon-lung (1736-1795) extended it into a system, and directed that the succeeding generations should take the four characters *Yung*, *Meen*, *Fih*, and *Tsae* respectively, as the first parts of their names. Eight other characters, namely, *P'u*, *Yu*, *Heng*, *Ke*, *Taou*, *K'ai*, *Tseng*, *Ke*, were subsequently added, thus providing generic names for twelve generations. With the present generation the first four characters are exhausted, and the sons of the present emperor, should he have any, will therefore be *P'u*'s. By the ceremonial law of the "Great Pure" dynasty, twelve degrees of rank are distributed among the princes of the imperial house, and are as follows:—1. Ho-shih Tsin Wang, prince of the first order; 2. To-lo Kenn Wang, prince of the second order; 3. To-lo Boileh, prince of the third order. 4. Koo-shan Baitsze, prince of the fourth order; 5 to 8. Kung, or duke (with distinctive designations); 9 to 12. Tseang-kenn, general (with distinctive designations). The sons of emperors usually receive patents of the first or second order on their reaching manhood, and on their sons is bestowed the title of *Beileh*. A *Beileh*'s sons become *Beitsze*; a *Beitsze*'s sons become *Kung*, and so on.

Language and Literature.

The Chinese language is the chief among that small class of languages which includes the Tibetan, Cochinchinese, Burmese, Korean, and Chinese, and which is usually described as monosyllabic. It is language in its most archaic form. Every word is a root, and every root is a word. It is without inflexion or even agglutination; its substantives are indeclinable, and its verbs are not to

be conjugated; it is destitute of an alphabet, and finds its expression on paper in thousands of distinct symbols.

It is then a language of monosyllabic roots, which, as regards the written character, has been checked in its growth and crystallized in its most ancient form by the early occurrence of a period of great literary activity, of which the nation is proud, and to the productions of which every Chinaman even of the present day looks back as containing the true standards of literary excellence.

But in treating of the two branches into which Chinese naturally divides itself, namely, the written medium or *Written characters* and the spoken medium or *sounds*, we propose to begin with the former. And in following this course we shall be doing no violence to the language, for it would be quite possible to separate the characters from the sounds, and to treat them as two languages, as indeed has already been partly done in Japan, where the Chinese characters were at one time in general use as representing the phonetic value of their Japanese equivalents. Beginning at the other end, but with a similar ultimate result, various members of the missionary body have published text-books and dictionaries in Romanized Chinese, that is to say, they have avoided the use of the characters by transcribing the sounds of the language in Roman letters. But since, though the characters are rich and copious to a degree, the sounds are out of all proportion poor, this last dismemberment presents the language in a very denuded form, and is at the same time attended with difficulties which only the most sanguine can hope to see overcome. The necessity of distinguishing between words having the same sound can only be met by the adoption of distinct diacritical marks for each word; and as one sound often represents as many as a hundred words, such a system cannot but be attended with confusion.

The characters of the language form the medium which speaks to the eye, and may be described as the equivalents of the written words of other languages; but unlike these, instead of being composed of letters of an alphabet, they are either symbols intended to represent images, or are formed by a combination of lines, or of two or more such symbols. All characters, say the Chinese lexicographers, had their origin in single strokes, or in hieroglyphics, and this, no doubt, is a correct view of the case. Legends differ as to who was the first inventor of writing in China. One attributes the invention to Fuh-ke (3200 B.C.), who is also said to have instituted marriage, and to have introduced the use of clothing, and who caused the knotted cords, which had been up to that time in use, to be superseded by characters founded on the shapes of his celebrated diagrams. Another record states that Tsang Ke who lived 2700 B.C., was the Cadmus of China. According to received native accounts, Tsang Ke was a man of extraordinary ability, and was acquainted with the art of writing from his birth. While wandering in the neighbourhood of his house at Yang-woo, he one day met with a tortoise, and observing its shell distinctly and beautifully spotted, he took it home, and thus formed the idea of representing the objects around him. Looking upwards he carefully observed the figures presented by the stars and the heavenly bodies; he then attentively considered the forms of birds, and of mountains and rivers, &c., and from them at length originated the written character.

But however great the uncertainty may be as to who invented the first characters, we may take it for granted that they were simply pictures of the various objects of sense which were present to the eye of the writer. Thus, when he wished to express a mountain, he wrote, as did also the ancient Egyptians,  a symbol which is written at the present day ;  now written , served him to signify "the eye," and so on. But such a written medium

was naturally extremely limited, and by degrees, in some instances by the addition of strokes, and in others by a combination of one or more of these primary characters, the written language has been formed as it is at the present day. In tracing the growth of the later characters we are assisted by the native philologists, who have divided them into six classes.

The first they call *Siang hing*, lit. characters representing the forms of the objects meant, or, as we should say, hieroglyphics, such as those just mentioned, and about 600 more, as, for example, ☉ *jih*, "the sun," 馬 *ma*, "a horse," &c.; and of these are composed, with a few exceptions, the 214 determinative or radical characters, one of which enters into the composition of every character in the language.

The second class is called *Chi sze*, lit. characters indicating things, that is to say, characters intended to represent ideas to the mind by the position of their parts. Thus the character 旦 *tan*, "dawn," in which the sun is represented as appearing above the horizon, belongs to it, and also such characters as 上 *shang*, "above," and 下 *hea*, "beneath," which are formed in the one case by placing a man above the medium level, and in the other below it.

The third class is made up of *Hwuy i*, lit. characters combining ideas, or ideographs. This class is formed by uniting two or more significant characters to give the idea of a third. Of the time when these characters were invented we know nothing; but it is plain that their introduction must have given a very extended scope to the language, and they offer an interesting study, as, in many instances, giving us an insight into the moral and social conditions of those who framed them. For instance, if we analyze the character 信 *sin*, "sincere," we find that it is formed by the combination of the characters 人 *jin*, "a man," and 言 *yen*, "words," a collocation of ideas which speaks well for the honourable truthfulness of the ancient Chinese, and which, when the unfortunate failing in this respect of their descendants is borne in mind, is decidedly opposed to the Darwinian theory as applied to language. The character 皇 *Hwang*, "Emperor," is another belonging to this class, which gives anything but a contemptible notion of the moral standard of the people. This symbol was originally written thus 皇, and was composed of the characters meaning "oneself" and "ruler;" the emperor was therefore to be ruler of himself, or autocrat in the true sense of the term; for how can a man, said the ancient sages, rule others unless he first learn to be master of himself?

Curiously enough, by the omission of a stroke, this character has assumed its present corrupted form, which consists of parts signifying "white" and "ruler," and this, as was mentioned in a recent letter from the St Petersburg correspondent of the *Times*, has been literally translated by the Mongols into Tchagau Khan, and then by the Russians into Biely Tsar, or White Tsar, the name by which the emperor of Russia is now known throughout all Asia.

Another character in this class is 明 *ming*, "brightness," which is composed of a combination of the sun and moon to indicate brilliancy. Altogether, of these ideographs there are said to be about 700 in the language, although some writers have held that this class is a very much larger one, and have justified their belief by analyses which, to say the least, are far-fetched. Callery quotes a Jesuit work, in which it is stated that the character 舟 *chuen*, "a ship," contains to the eye of faith—and we should imagine to that eye alone—a reference to the Flood, since it consists of 舟 *chow*, "a ship," 八 *pa*, "eight," and 口 *kow*, "a mouth," plainly pointing, adds the writer, to Noah's ark with its eight inhabitants; and that 婪 *lan*, "to covet and desire," bears traces of Eve's guilt in its component parts,

which are 女 *neu*, "a woman," and 木 *muh*, "a tree," twice repeated, illustrating the longing desire which overcame our first parent when between the trees of life and of good and evil.

The fourth class is the *Chuen choo*, or characters which, being inverted, either in form or sound, assume different meanings. These number about 372, and are formed in two ways,—either by some slight alteration of the character, as the turning of a stroke or of strokes to the left instead of the right, as, for instance, the character for the hand pointing to the left in this way 冫 means "left," and when turned thus 乚 means "right;" or by changing the sound of the character, and with the sound the meaning. Of this kind are such characters as 樂, which when pronounced *yö* means "music," and when *lò*, "delight," and 易, which as *i* means "easy," and as *yih* means to "change."

The fifth class is the *Chia chieh*, lit. characters having borrowed meanings, and consists of about 600 characters, which are applied, as is indicated by the name of the division, in a double sense, and hence have been called metaphorical. As an illustration of this class, Chinese writers adduce the character 矢 *shi*, "an arrow," which, from the straight course of an arrow, has come to signify "direct," "right," "a word spoken to the point."

The sixth class, which is known as the *Chieh shing*, or phonetic, embraces over 20,000 characters. The adoption of these phonetics was the turning-point in the progress of Chinese writing. As was the case with the Egyptians, the Chinese found that, having exhausted their power of invention in forming hieroglyphics and ideographs, a further development of the characters was necessary; and, like the subjects of the Pharaohs, they adopted certain characters to represent certain sounds. As to when, or by whom, this system was inaugurated, whether it was introduced from abroad, or whether it was the product of native intelligence, history is silent; but when it was once decided on, the language rapidly increased and multiplied. "A character," writes a well-known Chinese author, "is not sterile; once bound to another, it gives birth to a son; and if this be joined to another, a grandson is born, and so on." The characters, then, which belong to the class called phonetic are composed of two parts, namely, the primitive or phonetic element, that is to say, one of the characters which have been chosen to represent certain sounds, and which gives the sound to the whole character, and one of the 214 determinatives or radical characters of the language.

One or more of these determinatives enter into the composition of every character in Chinese, and as a very large proportion of them are plainly hieroglyphics, they may be said to be the foundation of the written language. As might be expected from their nature as hieroglyphics, they include the most remarkable objects of nature, such as the sun, moon, a river, a mountain, fire, water, earth, wood, stone, &c.; the chief parts of the human body, as the head, the heart, the hand, the foot, the eye, the ear &c.; the principal parts of a house, as the roof, the door, &c.; domestic animals, such as the sheep, the cow, the horse, the dog, &c.; the primary relations of society, as father, mother, son, daughter, &c.; qualities, such as great, small, straight, crooked, high, low, long, &c.; and actions; such as to see, to speak, to walk, to run, to stop, to enter, to follow, &c. They are thus admirably adapted to form generic terms, and this is the part they play in composition with the primitives. For instance, into the composition of every character signifying anything made of wood such as a table, a chair, a club, &c., the determinative character meaning "wood" is introduced, and it then serves much the same purpose as do the words "mat" and "steam" in the compounds "matshed" and "steamboat."

The number of the primitives has been variously estimated. Dr Marshman gives them at 3867, Callery at about 1000, and later writers have reckoned them to be from 1100 to 1200. Taking them over at the lowest of these figures, it will readily be imagined how, by combination with the 214 determinatives, they may be made to form the thirty and odd thousand distinct characters of the language, since, of course, it would be possible by combining each of the 1000 primitives with every one of the 214 determinatives, to form more than seven times that number of characters.

To illustrate this system of formation, we will take the primitive  ngo, "I," which by combination with 27 determinatives, produces as many derivatives having the same phonetic value, in this way—combined with the determinative  "a mountain," it becomes  ngo, "a high mountain;" with  neu, "a woman,"  ngo, "fair," "beautiful;" with  tsao, "grass,"  ngo, "a certain herb;" with  neaou, "a bird,"  ngo, "a goose," and so on. From these examples it will be observed that the determinatives play the part in some instances of adjectives; and in combination with their primitives they form an exact parallel with many Egyptian and Assyrian ideophonics. The following example in Egyptian shows precisely the same formation in the composition of the characters, and in the respective value of their parts, as is seen in the Chinese instance just referred to.  Un means in Egyptian "a hare;" combined with this determinative , it becomes  Un, "to open;" and with

this  Un, "an hour." Speaking of Assyrian hieroglyphics, Sir Henry Rawlinson says, "Certain classes of words have a sign prefixed or suffixed to them, more commonly the former, by which their general character is indicated. The names of gods, of men, of cities, of tribes, of wild animals, of domestic animals, of metals, of months, of the points of the compass, and of dignities are thus accompanied. The sign prefixed or suffixed may have originally represented a word; but when used in the way here spoken of, it is believed that it was not sounded, but served simply to indicate to the reader the sort of word which was placed before it."

These words of Sir Henry Rawlinson may be illustrated by the following examples.  means in Assyrian "wood," and is used as the determinative for things made of wood. Thus in combination with the primitive  it becomes  "a sceptre;" and when combined with the primitive  we have  "a bow." Again,  is used in the same way as the determinative for all carnivorous animals. Thus, for instance,  is "a dog," and  is "a lion." It will be seen that both the Egyptian and Assyrian characters here quoted are constructed on exactly the same principle as that to be observed in the formation of the majority of Chinese characters, but it is noticeable that in Assyrian the primitives do not retain in composition their phonetic values, as they generally do in Chinese, and as they often do in Egyptian.

Marking, then, the forces of the two parts of the characters, it is easy to imagine the way in which new characters have from time to time been formed. Supposing, for instance, that a tree for which a Chinaman wishes to give a name on paper is known to him colloquially as *ma*. The coiner of the new character would then in the first place choose a common phonetic or primitive possessing the sound *ma*; very possibly he would take the hieroglyphic  *ma* "a horse" and would combine with it the deter-

minative  *mul*, meaning "wood." The new character would then stand thus , and might be understood to signify "the *ma* tree;" but, unless previously informed, the reader would be left in complete ignorance as to the sort of tree meant, as the parts of the character would only supply the information that it was either a tree or something made of wood, and that it was to be pronounced *ma*. This is equally the case, speaking generally, with all the characters. By a careful study of the phonetics it is possible to arrive at the sounds or approximate sounds—for certain variations constantly occur—of the characters of the language; but the only hint at their meanings is to be derived from the determinatives, which point only to the general nature of the objects or actions signified.

As has already been said, the determinatives are 214 in number, and these have been considered by many of the native dictionary-makers to furnish convenient headings under which to arrange the characters of the language. Again, others have chosen to classify the characters according to their final sounds. Both systems have their advantages. By adopting the first, the headings are comparatively few, and the characters are, roughly speaking, classified according to the generic meanings they have in common; and the second gives constant practice to students in remembering the tones and correct rhyming pronunciation of the characters. But in both the phonetic relationship between the primitives is entirely lost sight of. And this is much to be regretted, since, as Callery and others have pointed out, the scientific way of arranging the characters would be by placing them under their primitives, by which means the respective values of both the primitives and determinatives would be brought out in prominent relief. Only in two Chinese dictionaries that we have met with have any attempts been made thus to arrange the characters, and the older of these, on which the later work was probably framed, owes the system on which it is composed to the experience imported from Japan by the co-compiler, who was a native of that country.

In the course of the above remarks a few instances have been given of the original and modern forms of the same characters, as, for example,  and . But, as may readily be supposed, the change from one to the other was not made all at once, and Chinese books afford instances of six distinct styles of writing, varying in clearness from the square character used in the books at the present day to the Seal and Grass or cursive characters, which are noted for their obscurity. These styles are described as the *Chuen shoo* or "seal character," the *Le shoo* or "official character," the *Keue shoo* or "model character," the *Hing shoo* or "running character," the *Tsao shoo* or "grass character," and the *Sung shoo* or "Sung-dynasty character," and may be illustrated by the following example, in which the character  *tsao* "herbs" is shown written in all the six styles just specified:—seal character ; official character ; model character ; running character ; grass character ; and Sung character . But above and beyond these six styles of writing, Chinese penmen not unfrequently allow their imaginations to run riot when engaged in fanciful or ornamental pieces of calligraphy. An extraordinary specimen of this quaint taste is to be seen in the Chinese Library of the British Museum, where there is a copy of the Emperor Keen-lung's poem on Monkden, printed both in Chinese and Manchoo in 32 kinds of strangely fanciful characters.

We will now pass on to the sounds of the language; Spoken and the first thing concerning them which strikes the student on becoming acquainted with his dictionary is their extreme poverty as compared with the characters. There are over 30,000 characters in the language, and these

are represented to the ear by only 500 syllabic sounds. No doubt the adoption of primitives as phonetics, as has been already described, has contributed to this result, since it provided for the due expression of the syllables then existing, but for no more. And thus, though it vastly enriched the written language—one primitive producing as many as 74 derivatives—it at once put a stop to all increase in the number of the sounds. The difficulty then arose as to the way in which 500 syllables were to be made to represent in conversation the thousands of characters in common use. And three methods have been adopted to prevent the confusion which at first sight would appear to be inevitable. These are—

1. By combining with the word which it is desired should be understood another, bearing a similar or supplementary meaning, to distinguish it by pointing to its meaning from other words bearing the same sound; thus, for “to hear,” it is usual to say in conversation 聽見 *ting keen*,—*ting* meaning “to hear,” and *keen* “to see or perceive.”

2. As regards noun substantives, by placing certain classifying words between them and the numerals which precede them. These classifiers bear some resemblance to our expressions *herd*, *head*, *fleet*, *troop*, &c., and have a certain reference to the nature of the substantives to which they are attached. For example, the word 把 *pa*, “to grasp with the hand,” is used as a classifier to precede anything which is held in the hand, such as a knife, a spoon, a hatchet, &c. Instead of expressing, therefore, a knife by *yih taou*, which might either mean a knife, a small boat, or a fringe, the classifier is introduced to show which *taou* is meant, and a speaker would say *yih pa taou*, literally “a grasped knife.” In like manner 間 *keen* “a space,” is used as a classifier for houses and enclosures; 根 *kān* “a root,” for trees, poles, clubs, &c., and so on.

And thirdly, by dividing the words of the language among eight tones. These tones partake of the nature of musical intonations, and are divided by the Chinese into two series, the upper and the lower, and are called by them the upper even, the upper rising, the upper departing, the upper entering, the lower even, the lower rising, the lower departing, and the lower entering. To each character is allotted its appropriate tone, which if wrongly rendered is liable to give an entirely different meaning to the word from that intended by the speaker. This possibility will be understood when it is remembered that the thirty and odd thousand characters find expression in about 500 sounds, thus giving an average of one sound to 60 characters, and these figures show that at best the system of tones is but an incomplete solution of the difficulty, since, were this average of 60 characters equally distributed among the full eight tones, there would remain nearly eight characters of each sound identical both in sound and tone.

But as a matter of fact, only the four tones of the upper series are in general use, to which sometimes the first or even tone of the lower series is added. The even tone is, as its name signifies, simply the ordinary tone of voice; the rising tone gives to the voice somewhat of the effect of an interrogation; the departing tone, of doubtful surprise; and the entering tone, of peremptory command. These may easily be illustrated by repeating our negative “No,” first in the ordinary tone of conversation, secondly as an interrogation, thirdly as expressing doubtful surprise, and fourthly as a peremptory refusal:—thus 1 No —, 2 No —, 3 No —, 4 No —. The difficulty of acquiring a knowledge of the tones proper even to the characters in common use is, as may be supposed, very great, and the only way to master them is to learn them, as the children learn them, from the lips of the natives themselves. No study of books will give the required knowledge. The Chinese learn them by ear alone, and if an educated man be asked

to give the tone of an isolated character, he generally has to repeat a phrase in which the character occurs in order that his lips may tell his ear the intonation proper to it.

It will be easily understood that the mistakes and difficulties into which this intricate system drives Chinese-speaking foreigners are often inconvenient and sometimes dangerous. Some years ago a petition on behalf of a Chinese criminal was presented by a wealthy Chinese merchant in person to the governor and council of Hong Kong. A well-known Chinese scholar undertook to interpret on the occasion, and the Chinaman began his speech with a reference to our *Kwai* \ *Kwok* or “Honourable kingdom,” as he designated England. Now the syllable *kwai* pronounced *kwai* means “devil,” and used in combination with *kwok* is an abusive term not uncommonly applied to any foreign country. Unfortunately the interpreter confused the two tones, and turning indignantly to the governor, he reported that at the very outset the petitioner had begun by speaking of England as “the devil kingdom.” The just anger of the council knew no bounds, and it was only after some minutes of wild confusion that an explanation followed, which saved the Chinaman from sharing the cell of the man for whom he was pleading. To a Chinaman such a mistake would be well-nigh impossible, for the tones form integral parts of the words, and to the ear of a native the difference between *kwai* in the ascending tone, and *kwai* in the descending tone, would be as great as between *kwai* and *kwan*.

There is only one other point in connection with the sounds of the language to which reference need now be made, and that is the system which has been adopted for spelling, as it were, the various sounds. For this purpose 36 characters which begin with the initial consonants of the language have been chosen, and 38 which end with the final sounds. In order, then, to indicate a desired sound, the writer takes a character of the first series which begins with the required initial, and a character of the second series which ends with the required final. These are placed together, and the initial of the first and the final of the second give the required sound. For instance, supposing a Chinaman were desirous of expressing that the sound of a certain character was *ting*, he would write the two characters 當 *tang* and 經 *king*, the first of which would give the initial *t*, and the second the final *ing*. This syllabic spelling, the initials of which are identical with the initial Sanskrit consonants, was introduced by the Buddhist missionaries in the 5th and 6th centuries, and from the time of the appearance of the dictionary *Yuh pien*, which was published in the year 543, it has been employed in every native dictionary of the language which has since seen the light.

With a language of roots, which is devoid of inflexion or even of agglutination, in which a large number of words each play the part, under varying circumstances, of substantives, adjectives, verbs, and adverbs, it may at first sight appear that grammar must be an impossibility. But inasmuch as there are in Chinese, as there must be in every language, certain words which, to quote Dr Marshman, “denote things, and others which signify qualities, there must be words to express actions done, and these as done by one or many, already done, now doing, or intended to be done; they must also be described as done absolutely or conditionally, as proper to be done, or peremptorily commanded. Further, the various circumstances of the doer, and of the subject of the action, must also be either plainly expressed or tacitly understood; hence the need of prepositions. Connecting words, too, necessarily exist in every language, as well as those which express the emotions of the mind. Thus the principles of grammar must substantially exist in every language.” And though the absence

of all inflexion in Chinese places the grammar of the language on a different footing from that of the polysyllabic languages, it is yet distinctly defined by the position and connection of the words of the sentence.

Position of
words in
sentences.

Since, when a language is spoken and understood only in the country of its birth or adoption, the study of the grammar affecting it is, as far as the natives are concerned, comparatively unimportant, we find that little attention has been paid by the Chinese to the grammar of their language. But practically the grammar, which, as has just been stated, consists of rules for the construction of the sentence, has for many centuries been enforced by example, and by the censorship of the examiners at the competitive examinations. If then we observe the connection of words which these authorities have preserved, we find that in every Chinese sentence the subject comes first, then the verb, which is followed by the complement direct and the complement indirect, and further that, as is the case in most of the Turanian languages, every word which defines or modifies another invariably precedes it. For instance, the adjective precedes the substantive, the adverb the verb, the genitive the word which governs it, and the preposition the word governed by it.

The importance of exactly following these rules becomes at once apparent when we remember that often one and the same word is capable of being used as a substantive, an adjective, a verb, or an adverb. This is the case also with some words in English. We use the word *present*, for example, as a substantive when we talk of giving a *present*; as an adjective when we say the *present* time; and as a verb when we say, "I *present* you." *Cut* is another word which we make use of in the same way. We say, "the *cut* of a sword," "*cut* grass," and "to *cut* a man down."

A number of other instances of the same kind might be adduced, but taking a Chinese word, we may show how, by varying its position in a sentence, it changes its grammatical value. The character 好 *hao* has for its meanings "to love," "good," "excellent," "well," &c., and possibly with the intention of illustrating, as it were, these meanings by representing the highest and purest form of natural affection, that which exists between a mother and her child, the inventor of the character has formed it of two parts signifying respectively "a woman" and "a son." If, then, we meet with it in such a connection as this, which is taken from the lips of Confucius, 見室家之好, *Kwei keen chih chia che hao*, we recognize it at once as a substantive, since, were it an adjective, it would be followed by a substantive; were it a verb, it would be followed by its complement, and also because it follows a substantive 室家, to which is added 之, the sign of the possessive case. The sentence should then be translated — *Kwei keen*, "to peep and see," *hao*, "the excellence or the goodness," *che*, "of," *chih chia*, "the apartments." In the sentence, also from Confucius, 如好好色 *Joo hao hao sik*, we see by the position of the two *haos* that the first must be a verb, and that the second must be an adjective, since it is followed by a substantive with which it forms the direct complement to the verb. The meaning of the sentence then is *Joo*, "as [when]," *hao*, "we love," *hao sik*, "excellent beauty." Again, in the modern colloquial expression 好說 we have an example of the use of *hao* as an adverb preceding a verb, and the phrase is then incapable of being translated otherwise than as "well said," *hao*, "well," *shuo*, "said."

The number of characters which might be treated as we have dealt with 好 is legion. Little has been said on the subject of this peculiarity of the language by native grammarians, who have not done much more for the science

of grammar than to divide the characters into 死字 *Sze tze* or "dead words," as they call nouns; 活字 *Hue tze*, "living words," or verbs; and 虛字 *Hsu tze*, "empty words," or particles. It is worthy of remark that in a great many instances the transition of a character from one part of speech to another is marked by a change of tone. This is the case with the character *hao*, of which we have been speaking. When it stands for the adjective "good," it should be pronounced in the ascending tone *hao*ˊ; and when it becomes the verb "to love," it is transferred to the departing tone *hao*ˋ. And in some few cases the character suffers a change of sound as well. 食 *shih*, the verb "to eat," is pronounced in the entering or abrupt tone; but it becomes *sze*ˋ in the departing tone, when it plays the part of a substantive meaning "food." In a lecture administered to the king of Leang, Mencius, rebuking him, says, 狗彘食人食 *Kow che shih jin sze*ˋ, "Your dogs and swine eat men's food." Here it will be observed the first 食 must by the rules of position be the verb *shih* "to eat," and by the same necessity this same character at the end of the sentence must be a substantive; and the dictionaries tell us that, when this is the case, it is pronounced *sze*. But though it is true that a vast number of characters can be made to serve a writer in a variety of capacities, yet each belongs more particularly to some one part of speech, and many are identified with that one alone. For instance, we find that certain substantives which express things, such as *cho* "a table," or *e* "a chair," remain fixed as substantives, and that others, if they denote actions, are primarily verbs, and if conditions, such as "honour" or "riches," are in the first instance adjectives.

As might be expected from the nature of the language *Gender*, of which this interchangeability forms a part, Chinese admits no variations of gender, and in this particular it agrees with the Manchoo, Mongolian, Turkish, and Finnish families of tongues, in which, as Dr Caldwell points out, not only are all things which are destitute of reason and life denoted by neuter nouns, but no nouns whatever, not even nouns which denote human beings, are regarded in themselves as being masculine or feminine. All nouns as such are neuter, or rather are destitute of gender. "The unimaginative Scythian reduced all things," adds the doctor, "whether rational or irrational, animate or inanimate, to the same dead level, and regarded them all as impersonal." But in every language there are certain words the gender of which must necessarily be distinguished, and in common also with the peoples just referred to, to these the Chinese prefix words denoting sex. Thus a son is spoken of as 男子 *nan tze* or "man-child," and a daughter as 女子 *neu tze* or "woman-child." In the case of animals other characters are used. 公 *kung*, "noble," "superior," is employed to denote the male and 母 *mo*, "mother," to indicate the female. Thus 公馬 *kung ma* is "a horse," and 母馬 *mo ma* is "a mare." With birds other characters are considered more appropriate. Thus, the male is described as 雄 *kung*, "martial" or "brave," and the female as 雌 *tze*, "weak," or "inferior."

As regards number, Chinese is left in an equally *Number* indefinite condition. As a rule it is the connection of the words of the sentence which determines whether a noun is in the singular or plural. Often, however, the plural is indicated by repeating the noun, as 人人 *jin jin*, "the men," or by the presence of a numeral, as in the following expression, taken from the *Confucian Analects*, 三子若出, "The three disciples went out." Here the character 三, "three," indicates that *tze* is in the plural, although it has no inherent mark of number. Another way of pluralizing a noun is by adding to it one of certain words signifying

"all" or "many." The most common of these are 眾 *chung*, 諸 *choo*, 皆 *keae*, 凡 *fan*, and 等 *täng*. The first four have for their meaning "all," and the last, *täng*, means "a class." Its use, like its meaning, is distinct from the others; they precede the noun, *täng* always follows it, and forms with it a compound such as "animal-class" for animals, "man-class" for men. In colloquial Chinese the character 們 *mun* has been adopted as a sign of the plural, but its use is almost entirely confined to the personal pronouns. Thus 我 *wo* means "I," and 我們 *wo mun* "we."

Case.

The rules of position which serve to fix the parts of speech of the words of a sentence are allowed also in great measure to regulate the cases of nouns and the moods and tenses of verbs. But this is by no means always the case. For example, the possessive case is marked by certain particles of which mention will be made presently; and although European writers on Chinese grammar have been in the habit of considering that when two substantives come together, the first is to be taken as being in the possessive case, thus in the sentence 天子好學 *Teen tsze hao heó*, which we should translate as "the Son of Heaven loves learning," *teen*, they would say, is in the possessive case,—it may be questioned whether such expressions may not be more appropriately considered as compound terms, in the same way, that we treat their equivalents in English. For instance, we should never consider such an expression as "the Chelsea-water-works" to consist of a nominative and two possessive cases, as it would be parsed by these grammarians, were it turned word for word, as it might be, into Chinese. And this treatment becomes still more difficult of adoption when we find, as is often the case in Chinese, a number of substantives strung together, all of which, with the exception of the last, would then have to be considered as a succession of possessive cases. If we take, for example, one of the ordinary marks on porcelain made in China, such as 大明萬曆三年製 *Ta ming Wan leih san neen che*, we should be told to consider *Ta ming*, *Wan leih*, and *neen*, as possessive cases, and that the phrase should be translated, "The manufacture of the third year of (the reign) Wan-leih of the Ta ming dynasty," instead of treating it as a compound expression on the "Chelsea-water-works" principle, thus "The Ta-ming-dynasty-Wan-leih-third-year-manufacture."

Besides, Chinese is by no means destitute of case-particles. In the literary and colloquial languages the possessive is expressed by suffixing respectively 之 *che* and 的 *teih* to the substantive. Thus these particles answer exactly to the 's commonly used in English. 天之恩 *Teen che gän* is "The favour of 'heaven,'" or, as we should as often say, "heaven's favour." 那個女人的狗 *Na ko neu jin teih kow* is "The dog of that woman," or "That woman's dog." If we trace back the case-particle 之 *che* to its earliest use, we find that it was originally a verb, and meant "to proceed to," and thus, as a sign of the possessive case, it implies the sense of partition which is inherent in our "of" and the French *de*. In some instances, by its addition to certain substantives, compound nouns of possession are formed which are capable of being used as adjectives. For example, 金 *kin* is "gold," and 金之 is "of gold," or "golden." It is used also to express relation, but not as frequently as its colloquial equivalent 的 *teih*, which is very commonly thus employed. Such expressions as 管兵的 *kwan ping teih*,—*teih*, "he who," *kwan*, "rules over," *ping*, "soldiers"—are in constant use.

With verbs of giving to and speaking to the dative case is marked by position. The person to whom a thing is

given immediately follows the verb, and the thing given comes next. The sentence "The prince gave the officer some money," is in accordance with the Chinese idiom, which would not admit the more usual English form, "The prince gave some money to the officer." The dative case, with the sense of "for," is marked by the use of the characters 代 *tae*, "to succeed," 替 *te*, "to put another instead of," and 爲 *wei*, "to be"; thus 代我寫書 *tae wo seay shoo*, "to write a letter for me," 替我的女兒 *te wo teih neu urh*, "for my daughter," &c.

The accusative case is as a rule marked by position. But occasionally, as has been shown by M. Julien, the particles 以 *e*, 於 *yu*, 于 *yu*, and 乎 *hoo*, are disassociated from their usual signification, and are employed simply as signs of this case.

The instrumental case is indicated by the character 以 *e*, "by," in the language of the books, and by 用 *yung*, "to use," in the colloquial. As an instance of the use of the first, we may quote the following passage from Mencius:— 難固以非其道 *Nan wang e fei ke taou*, "(A superior man) cannot be entrapped by that which is contrary to right principles."

The ablative case, having the sense of "from," is marked by the signs 自 *tsze*, and 由 *yew*, and in the colloquial by 從 *tsung*, as in the following examples:— 自生民以來 *Tsze säng min e lae*, "From the birth of mankind until now;" 由湯至於武丁 *Yew Tang che yu Woo-ting*, "From Tang until you arrive at Woo-ting;" 他從北京來了 *Ta tsung Pih king lae leaou*, "He has come from Peking."

The remarks which have been made on the gender, number, and case of the substantives apply in like manner to the adjectives, and we need only now refer therefore to the manner in which degrees of comparison are formed. The comparative is denoted either by certain particles meaning "more than," or "beyond," or in the colloquial by forms of expression such as "This man compared with that man is good," or again, "This man has not that man's goodness." As signs of the superlative, words such as 最 *tsuy*, "excelling," 極 *keih*, "the highest point," or 甚 *shin*, "exceeding" are employed.

In all Oriental languages the personal pronouns play a prominent part from their number and the variety of equivalent terms, whether of self-depreciation or of complimentary adulation, used to express them; and in Chinese they derive additional importance from the fact that in the absence of all verbal inflexion, they serve to indicate the person, and in the spoken language the number of the verb. 吾 *woo*, 爾 *urh*, and 其 *ke*, are the terms most commonly used in classical writings to signify the first, second, and third persons of the personal pronoun, of which 我 *wo*, 你 *ne*, and 他 *ta*, are the common colloquial equivalents. These latter have for their plural 我們 *wo mun*, 你們 *ne mun*, 他們 *ta mun*. Quite separate and apart from these and all their equivalents is the character 朕 *chin*, which is reserved especially for the emperor, and has been the traditional imperial "Wo" since the time of the three mythical emperors to whose wisdom, energy, and foresight the greatness of China is attributed by the native historians.

But not always does the emperor feel himself entitled to use this inherited character. In times of national misfortune he chooses to believe that his own remissness is the cause of the evils which have overtaken the country, and then it is the custom for him to designate himself 寡人 *Kwa jin*, or "Deficient man." With his subjects the assumption of a similar humble position is habitual, and among acquaintances the place of "I" is nearly always taken by terms by which the speaker seeks to give a complimentary importance to the person addressed at the expense of his

own intellectual or social position. "The dullard," "the little one," and "the man of low degree," are terms most frequently used in this sense, while *nu tsai*, or "slave," is the self-assumed epithet adopted by ministers when addressing the emperor. In like manner the speaker's relations and personal belongings are spoken of as "the little," "the mean," and "the cheap." The respect due to age guides on the other hand the choice of expressions employed towards the person addressed, who, instead of being called by the second person of the pronoun, hears himself addressed as "Master," "Old Gentleman," or "Senior." The holders of the lower offices, such as the *Heen* or district magistrates, are addressed by law as *Lao ye* or "Old Fathers;" as they rise, they become *Ta lao ye* "Great Old Fathers;" and when they reach the higher ranks, such as the governors of the provinces, they are called *Ta jin* "Great Men." In the same spirit it is customary to speak of the belongings of another as being "worshipful," "honourable," or, "august."

Numerals.

History is vague as to the date when the Chinese adopted the numerals they at present employ; but as we find reference to them in the *Book of History*, it is fair to infer that they were in existence before the 6th century B.C. They are 17 in number, and are these: 一 *yih*, "one," 二 *erh*, "two," 三 *san*, "three," 四 *sz*, "four," 五 *woo*, "five," 六 *luk*, "six," 七 *tseh*, "seven," 八 *pa*, "eight," 九 *ker*, "nine," 十 *shih*, "ten," 百 *pih*, "a hundred," 千 *tseen*, "a thousand," 萬 *wan*, "ten thousand," 億 *pih*, "one hundred thousand," 兆 *chaou*, "a million," 京 *keng*, "ten millions," and 欸 *kai*, "a hundred millions." The last four are now very seldom used, the rest are hourly employed. It will be seen that there is no single numeral between ten and one hundred, and the intervening numbers are therefore formed by *shih* "ten" in combination with the lower numerals. For example, the numbers between ten and twenty are expressed by *shih* "ten" with the addition of the number required. Thus "thirteen" would be 十三 *Shih san*. The figures between twenty and a hundred are denoted by 十 *shih*, "ten" preceded by the other numeral, and in this way 三十 *San shih* would be "thirty."

Moods and tenses.

After the explanation given of the manner in which the number, gender, and case of nouns are clearly expressed in composition, it need not be a matter of surprise that by position and the use of particles it is possible to give expression to all the moods and tenses of the verb. Such a fact should not astonish us when it is recollected that, as stated by Marshman, in the case of certain English verbs, such as "to cut," position is found equal to the task of forming 211 out of the 215 verbal variations which such verbs undergo, and four only are formed by the addition of terminations to the original monosyllable, namely "cuttest," "cuts," "cutteth," and "cutting." As no change, not even the lengthening of a line, or the addition of a dot, can possibly be effected in a Chinese character without entirely altering its meaning, position has to do everything for the Chinese verb, and it accomplishes its mission in two ways, either by stating the time at which the action has taken place, or is about to take place, or by prefixing or suffixing certain words which by their several meanings supply like information. For instance, in the colloquial sentence 如今他來 *joo kin ta lai*, *joo kin*, "now," indicates that the action is present, and the three characters are to be translated "he is coming." But if we were to exchange the *joo kin* for 明年 *ming neen*, "next year," the verb *lai* will be in the future tense, "next year he will come;" and if yet once again we say, 上月 *shang yue* *ta lai*, *shang yue* meaning "last month," the verb will then be in the past tense, and the sentence will run, "last month

he came." But more frequently the present tense of the verb is not accompanied with any word to denote the time of the action, and indeed the only tense-particles employed are those which serve to explain the past and future tenses. The characters 了 *leau*, "to complete," and 過 *kuo*, "to pass over," are the commonest of those which are suffixed to denote the first, and 將 *tsang*, "to take," and 要 *yaou*, "to want," are the most frequently used as prefixes to mark the second. Thus, *ta ken leau*, or *ta ken kuo*, would mean "he went," while *ta tsang ken* or *ta yaou ken* would be "he will go."

In every language, as Marshman has pointed out, "it will sometimes be found necessary to indicate or declare a thing, to command an action to be performed, to express it as desirable, obligatory, or possible, to represent it as conditional, and to describe it in a general way," and Chinese is no exception to this rule. In the case of the active and infinitive moods, position, which, as we have already seen, has done so much for Chinese grammar, is again equal to the occasion, but the imperative, the optative, and the potential moods all, although not always, have their distinctive signs.

The third person of the imperative mood, for instance, is formed in modern Chinese by prefixing a verb meaning either "to give" or "to permit," and answers exactly to our "let." 許他去 *heu ta ken* is "let him go," *heu* meaning "to allow," "to permit." The optative mood is formed by the addition of words meaning "to wish" or "to desire," and the potential by the addition of words implying "power," "duty," or "doubt."

The above sketch, although necessarily brief, serves to show that by carefully following the laws of Chinese syntax, it is possible to express in Chinese, as exactly as in other languages, all the parts of speech in all their variety of number, gender, case, mood, tense, and person, and therefore every shade of meaning which it is possible to convey by word of mouth. The difficulties of acquiring a knowledge of Chinese have hitherto shared that exaggeration which surrounds the unknown. It is time that the language was better understood, and at this period of the world's history we cannot afford to leave unnoticed a language so ancient as to dwarf into insignificance the antiquity of western tongues, and one which is the solitary medium of communication between 400,000,000 of our fellow-men.

Having thus attempted to trace the growth of the Literature, written Chinese character from its first creation as a hieroglyphic to its final development in the more modern ideophonetic form, and also the rules which govern the position of these characters in a sentence, our object will now be to show the use which Chinese authors have made of the characters and of the grammar to which they are subservient. It was obviously necessary to begin with the language, before dealing with the literature, since some of the leading characteristics of the literature are, as is the case in every tongue, plainly traceable to the structure of the language. The words of a sentence are as a piece of clay in the hands of a potter. If they be soft and pliable, that is to say, if they be capable of inflections and of syntactical motion, they may be moulded to express with varying vigour and force the highest fancies and noblest thoughts of an able writer in all the changing beauty of poetic diction or of rhetorical eloquence. But if on the other hand they be destitute of inflexion, and be cramped by inexorable laws of position, which cannot for a moment be departed from, without a sacrifice of sense, the result must be that the literature of which they are the component parts will partake to some extent of their hard unyielding nature. If we turn for a moment to the poetry of ancient Greece and Rome, we find that some of the finest effects have been produced by the power which the inflexional nature

of those languages gave of transposing the position of words in a sentence, so as to give vigour and grace to the rhythm. To prove the truth of this we have only to take some striking passage, and compare it in the original with a plain straightforward translation in prose. The idea is the same in both, but how differently it appeals to the imagination of the reader. The gem is there, but it has lost the advantage of its setting. It must now be judged by the prosaic rule of its intrinsic value, with no softening surroundings to add grace and brilliancy to its natural beauty.

But the effective weapon which was thus placed in the hands of the poets and authors of ancient Greece and Rome has been completely denied to Chinese writers. As has been explained, the language is absolutely without inflexion, and the grammar consists so entirely of syntax, that no word can be moved out of its determined position in a sentence, without either changing its value or rendering it meaningless. Thus the literature has lost much of the variety and elegance which belongs by nature to that of the polysyllabic languages. And we might go beyond this and say that the lack of that power of expression which is given by syntactical motion has been accompanied by a blighting influence on the imaginations of Chinese authors. Other causes, to which reference will presently be made, are also to some extent responsible for this result; but in our review of the various branches of Chinese literature, we shall find that those which are most dependent for their successful development on the powers of imagination are those which least repay attention, and that the more excellent are those which contain simple narrations of facts, or consist of the arguments of the philosopher or of the man of science.

But notwithstanding this the Chinese are eminently a literary, in the sense of a reading, people. The system of making competitive examinations the only royal road to posts of honour and emolument, and the law which throws these open to everybody who chooses to compete, have caused a wider diffusion of book learning among the Chinese than is probably to be found among any other people. As to the date when the literature first took its rise, it is impossible to speak with any certainty. The vicissitudes which attended the early manuscripts and books which were collected by private individuals and in the imperial libraries have been such as to render the preservation of any ancient record a matter of wonder. Constant references are found in books to works which are said to have existed at early dates, but of many of these the titles are all that remain to us now.

Book of
Changes.

One of the earliest published works on which we can lay our hands is the *Book of Changes*, the first, and the most revered, because the least understood, of the nine classics. This work first saw the light within a prison's walls. In the year 1150 B.C. its author Wān Wang was, we are told, imprisoned for a political offence, and sought to while away the tedium of his confinement by tracing out a system of general philosophy from the eight diagrams and their 64 combinations invented by the Emperor Fu-he. These diagrams have been likened to the mystical numbers of Pythagoras, and the leading idea of Wān Wang's system seems to have been founded upon the Chinese notions of the creation of the world, according to which all material things proceed from two great male and female vivifying elements, the *Yin* and the *Yang*, which in their turn owe their existence to the *Tai keih*, or the first great cause. As Sir John Davis says, this "might, with no great impropriety, be styled a sexual system of the universe. They, that is to say the Chinese, maintain that when from the union of the *Yang* and the *Yin* all existences, both animate and inanimate, had been produced, the sexual principle was conveyed to and became inherent in all of them. Thus heaven, the sun, day, &c., are considered of the male

gender; earth, the moon, night, &c., of the female. This notion pervades every department of knowledge in China. It exists in their theories of anatomy and medicine, and is constantly referred to on every subject. The chief divinities worshipped by the emperor as high priest of the state religion are heaven and earth, which in this sense appear to answer in some degree to the *oûparós* and *γῆ* in the cosmogony of the Greeks."

The style and matter of Wān Wang's writings were, however, so cramped and vague that Confucius among others attempted the task of elucidating their dark places. Many years the sage spent in endeavours to make straight that which was so crooked; and the only result attained has been to add some inexplicable chapters to an incomprehensible book. But the fact that it gave rise to a system of divination saved it from sharing the fate which, in the year 221 B.C., befell all books except those on medicine, divination, and husbandry, at the hand of the Emperor Che Hwang-ti of the Tsin dynasty. This monarch ordered, for political reasons, the destruction of all the books to be found within the empire, except those on the subjects just mentioned. Fortunately, no monarch, however powerful, is able to carry out to the letter an order of so inquisitorial a nature; and the roofs of houses, the walls of dwellings, and even the beds of rivers, became the receptacles of the literary treasures of the nation until the tyranny was overpast. The works of Confucius, the *Book of History*, the *Book of Odes*, the *Spring and Autumn Annals*, together with the *Book of Rites*, and the *Four Books* by the disciples of the sage and of Mencius, were all alike condemned to the flames. How all these were preserved we know not, but history tells us that, when in after years efforts were made to restore the *Book of History*, 28 sections out of the 100 composing the entire work were taken down from the lips of a blind man who had treasured them in his memory. One other was recovered from a young girl in the province of Honan. And these are all which would probably have come down to us, had not a complete copy been found secreted in the wall of Confucius's house, when it was pulled down in the year 140 B.C.

This *Book of History* takes us back to about the time of Noah. It consists of a number of records of the Yu, Hea, Shang, and Chow dynasties, embracing the period from the middle of the 24th century B.C. to 721 B.C. These, and a number of other MSS., attracted the attention of Confucius when he was at the court of Chow, and selecting those which he deemed of value, he compiled them in a work which he called the *Shoo king* or *Book of History*.

This work, as Mr Wells Williams says, "contains the seeds of all things that are valuable in the estimation of the Chinese; it is at once the foundation of their political system, their history, and their religious rites, the basis of their tactics, music, and astronomy." For the most part it consists of conversations between the kings and their ministers, in which are traced out the same patriarchal principles of government as guide the rulers of the empire at the present day. "Virtue," said the minister Yih, addressing the emperor, "is the basis of good government; and this consists first in procuring for the people the things necessary for their sustenance, such as water, fire, metals, wood, and grain. The ruler must also think of rendering them virtuous, and of preserving them from whatever can injure life and health. When you would caution them, use gentle words, when you would correct, employ authority." "Do not be ashamed of mistakes, and thus make them crimes," was another piece of wholesome advice offered to the emperor by his advisers, the effect of which is still observable in the outspoken confessions of official incompetence which are daily to be met with in the columns of the *Peking Gazette*.

Book of
Rites.

As we shall have occasion at a subsequent stage to treat at some length of the compilation which stands next on the list of the classics,—the *Book of Odes*,—we pass on to mention a work whose dicta have entered into the very marrow of Chinese life—namely the *Le ke*, or *Book of Rites*. This work is said to have been compiled by the duke of Chow in the 12th century B.C., since which time it has ever been the guide and rule by which Chinamen have regulated all the actions and relations of their lives. No every-day ceremony is too insignificant to escape notice, and no social and domestic duty is considered to be beyond its scope. From the nature of its contents, therefore, it is the work of all the classics which has left the most palpable impression on the manners and customs of the people. Its rules are minutely observed at the present day, and one of the six governing boards at Peking—the Board of Rites—is entirely concerned with seeing that its precepts are carried out throughout the empire.

Spoking of this work, Callery says with justice, “In ceremonial is summed up the whole soul of the Chinese, and to my mind the *Book of Rites* is the most exact and complete monograph that this nation can give of itself to the rest of the world. Its affections, if it has any, are satisfied by ceremonial; its duties are fulfilled by means of ceremonial. Its virtues and vices are recognized by ceremonial; the natural relations of created beings are essentially connected with ceremonial; in a word, for it ceremonial is man, the man moral, the man politic, and the man religious, in their numberless relations with the family, society, the state, morality, and religion.”

Spring and
Autumn
Annals.

But though each and all of the classics bear to some extent the impress of Confucius, only one, the *Chun Tsew*, or *Spring and Autumn Annals*, was written by him. At first sight, therefore, a more than usual interest attaches to this book, which is not lessened by the statements made by the sage himself, and by contemporary scholars concerning it. “The world,” says Mencius, “was fallen into decay, and right principles had dwindled away. Perverse discourses and oppressive deeds were again waxing rife. Cases were occurring of ministers who murdered their rulers, and of sons who murdered their fathers. Confucius was afraid, and made the *Chun tsew*.” As soon as it appeared, we are told that rebellious ministers quaked with fear and undutiful sons were overcome with terror. “Its righteous decisions,” said Confucius himself, “I ventured to make.”

The title also of the book, we are told, was given it, because its commendations were life-giving like spring, and its censures life-withering like autumn. The expectant student might therefore be excused for anticipating in its pages an intellectual treat. He would look to have the history of the period dealt with treated as a sustained narrative, interspersed with sage reflections and deep analyses of the characters and circumstances of the time. He would expect to find praise and blame distributed with a discriminating pen, and the foul crimes of regicide and murder denounced in impassioned outbursts of indignation. But how different is the book when we take it up! In the words of Dr Legge—“Instead of a history of events woven artistically together, we find a congeries of the briefest possible intimations of matters in which the court and state of Loo were more or less concerned, extending over 242 years, without the slightest tincture of literary ability in the composition, or the slightest indication of judicial opinion on the part of the writer. The paragraphs are always brief. Each one is designed to commemorate a fact; but whether that fact be a display of virtue calculated to command our admiration, or a deed of atrocity fitted to awaken our disgust, it can hardly be said that there is anything in the language to convey to us the shadow of an idea of the author's feeling about it. The

notices, for we cannot call them narratives, are absolutely unimpassioned. A base murder and a shining act of heroism are chronicled just as the eclipses of the sun are chronicled. So and so took place: that is all. No details are given; no judgment is expressed.”

The following extract from the annals of a year taken at random will be sufficient to show that Dr Legge's remarks are well founded. “1. In the 15th year in spring the duke went to Tse. 2. A body of men from Tsou invaded Sen. 3. In the third month the duke had a meeting with the marquis of Tse and others, when they made a covenant in Mow-Kow, and then went on to Kwang. 4. Kung-sun Gaon led a force and, with the great officers of the other princes, endeavoured to relieve Sen. 5. In summer in the 5th month the sun was eclipsed. 6. In autumn in the 7th month an army of Tse and an army of Tsou invaded Lo. 7. In the 8th month there were locusts. 8. The duke's daughter went to her home in Tsang. 9. On Ke-mao, the last day of the moon, the temple of E-pih was struck by lightning. 10. In winter a body of men from Sung invaded Tsou.” And so on page after page.

Having thus reviewed the *Five Classics*, we will now ^{The Four} briefly consider the *Four Books* which, together with those just mentioned, make up the full complement of the *Nine Classics*. The first three of them—the *Ta-ho* or *Great Learning*, the *Chung-yung* or the *Doctrine of the Mean*, and *Lun-yu* or *Confucian Analects*—are all by the pupils and followers of the sage; while the fourth, the *Ming-tse*, or the *Works of Mencius*, is by a disciple of that philosopher. All these, therefore, represent the views of Confucius, and if we ask what those views point to, we find that they may be summed up in the admonition: “Walk in the trodden paths.” For as Confucius said of himself, he came not to originate but to fulfil, and the primary object of his teaching was to revive in a dissolute age the purity, or supposed purity, of former generations; to quote against the *routes* of his day the examples of the ancients, whom he believed to have been scrupulous in fulfilling the universal obligations existing between sovereign and minister, between father and son, between husband and wife, and between friend and friend. He taught that man was a microcosm, and that by striving to improve himself by acquiring knowledge, by purifying his thoughts, by rectifying his heart, and by cultivating his person, he would then be able to regulate his family. When he could regulate his family, he might then be able to govern a state; and when he could govern a state, he might then be trusted to rule an empire. The empire was as one family; and as it was the part of the emperor to cherish and guard his people as a father does a child, so it was the duty of the people to render willing and submissive obedience to their sovereign.

It is due to these political opinions that Confucius has become such an object of respect to both rulers and the ruled. The former see in his teaching a ready argument for the maintenance of their authority, and the people, believing that heaven has constituted for them rulers and teachers, whose duty it is to extend favour and maintain tranquillity throughout the empire, have at the same time learnt to hold that when the ruler ceases to be a minister of God for good, he forfeits the title by which he holds the throne. Confucius was ambitious, and was a courtier as well as philosopher, and beyond this point he avoided in any shape or way indicating the manner in which an oppressive ruler should be induced to abdicate. No such consideration influenced his disciple Mencius, who, being superior to the ordinary ambitions of man, was superior also to their common timidities, and who with much boldness of utterance freely taught that the people were the most important element in a nation, and the sovereign was the lightest; and he did not scruple to admit the conclusion

that an iniquitous ruler should be dethroned, and, if circumstances required it, that he should be put to death.

The *Confucian Analects* and the *Works of Mencius* differ in their construction from the *Great Learning* and the *Doctrine of the Mean*, both of which are continuous treatises by individual authors; whereas the two first named are records of the sayings and doings of the two sages, compiled from memory by their faithful disciples, and somewhat resemble in construction, but at a vast interval, the plan of the Gospel narrative.

We have dwelt at some length on the classics, because, since they are the sacred books of China, it is natural to suppose that in them we may find the mainspring of the national literature. Unfortunately, to some extent this is the case, and Confucius has much to answer for, both as regards his teaching and the literary model he bequeathed to his countrymen. Instead of encouraging his disciples to think for themselves, to look into their own hearts, and to acquire that personal knowledge that enables a man to stand alone, he led them out both by precept and example into the dreary waste of cold formalism, in which all individuality is lost, and all force and originality of thinking is crushed out. It may be said that, as far as his teachings were concerned, he strove to suit his system to the capacity of his audience; and that he was successful in so doing is proved by the fact that for twenty-two centuries his name has been revered and his precepts have been followed by his countrymen of whatever rank and station in life.

As has been well observed by Wells Williams, "If Confucius had transmitted to posterity such works as the *Iliad*, the *De Officiis*, or the *Dialogues of Plato*, he would no doubt have taken a higher rank among the commanding intellects of the world; but it may be reasonably doubted whether his influence among his own countrymen would have been as good or as lasting. The variety and minuteness of his instructions for the nurture and education of children, the stress he lays upon filial duty, the detail of etiquette and conduct he gives for the intercourse of all classes and ranks in society, characterize his writings from those of all philosophers in other countries, who, comparatively speaking, gave small thought to the education of the young. The *Four Books* and the *Five Classics* would not, as far as regards their intrinsic character in comparison with other productions, be considered anything more than curiosities in literature, for their antiquity and language, were it not for the incomparable influence they have exerted over so many millions of minds."

But no such apology can be offered for the example he set them in the substance and style of his writings. And we are forced to the conclusion that, though a man of great force of character, he was yet strangely devoid of imagination, and that, in his blind admiration for the ancients, he constrained himself to walk humbly and passively in the paths that had been traced by others. At all events he has done his countrymen an irreparable injury. The inflexible sterility of the earliest specimens of literature might possibly have been the characteristic of a particular phase in the national mind, but Confucius helped to perpetuate it throughout all generations. As might be expected, in no class of the literature is the effect thus produced more apparent than in the commentaries on the classics. These works are to be numbered by thousands, and, with some few exceptions, they are, as has been said of the writings of the scribes at the time of our Lord, cold in manner, second-hand and iterative in their very essence; with no freshness in them, no force, no fire; servile to all authority, opposed to all independence; never passing a hair's-breadth beyond the carefully-watched boundary line of precedent; full of balanced inference and orthodox

hesitancy, and impossible literalism; elevating mere memory above genius, and repetition above originality.

But whatever may be the shortcoming of Confucius as a writer, the respect he felt and inculcated for letters gave an impetus to literature. Following the example he set, men began to compile the histories of the various states; and authors with a turn for more original composition busied themselves with the production of works on such arts and sciences, including medicine, mathematics, law, and husbandry, as were known to them. It was just as this new industry was beginning to flourish that the Emperor Che Hwang-ti, to whom reference has already been made, an able and ambitious prince, ascended the throne. By a judicious mixture of force and diplomacy, he abolished the feudal states, into which the empire had up to his time been divided, and drew all power and authority into his own hands.

Estimating the traditions of the past to be almost as potent as Confucius had supposed, and for that very reason deeming them as dangerous to the existence of his rule as Confucius had considered them to be beneficial to the empire, he determined to break with them once and for ever. He therefore issued an order that all books should be burned, except those containing records of his own reign; that all who dared to speak together about the *Book of Odes* or the *Book of History* (harmless subjects enough, one would think) should be put to death, and their bodies exposed in the market-place; that those who should make mention of the past, so as to blame the present, should be put to death along with their relatives; and that any one possessing a book after the lapse of thirty days from the issuing of the ordinance should be branded and sent to labour on the Great Wall for four years. The publication of this edict was followed shortly afterwards by an order for the execution of upwards of 460 scholars who had failed to obey the mandate of the emperor.

Curiously enough it was during the reign of this uncompromising enemy to literature that the brush-pencil as at present used in China for writing purposes, was invented,—an invention which implies that about this time a substitute was found for the bamboo tablets which had up to that period served the purposes of paper. At first this new material was a kind of closely woven silk. But this was soon found to be as unsuitable for general purposes from its expense as the tablets had been from their ennobleness; and shortly after the establishment of the Han dynasty, when the decrees of Che Hwang-ti were reversed and every encouragement was given by the state to men of letters, the Marquis Tsae "invented the manufacture of paper from the inner bark of trees, ends of hemp, old rags, and fishing-nets." The increased facility thus afforded for the multiplication of books was eagerly taken advantage of; and from the Annals of the Han dynasty, 206 B.C. to 25 A.D., we learn that the imperial library of that reigning house consisted of 3123 sections on the classics, 2705 on philosophy, 1318 of poetry, 790 on military affairs, 2528 on mathematics, and 868 on medicine. But at the end of the second century an insurrection which brought the Han dynasty to a close, gave another check to the growing literary taste. And though the then reigning emperor, in his flight from his capital at Lo-yang, attempted to carry off the contents of the imperial library, only half the books reached their destination at Chang-gan, and the remnant was shortly after given to the flames by the successful revolutionists.

Such as had been the course of literature up to this time, so it continued until the close of the 6th century, when the art of printing, which became known in Europe nearly 900 years later, was invented in China. A well-known Chinese Encyclopædia tells us that on the 8th day of the 12th month

of the thirteenth year of the reign of Wān-ti (593 A.D.), it was ordained by a decree that the various texts in circulation should be collected, and should be engraved on wood, to be printed and published. Thus within a few years of the time when St Augustine brought the enlightening influences of Christianity to these Isles, the art of printing—a civilizing agency second only to Christianity—was made known in China. But at first comparatively little use seems to have been made of the invention, for we are told that though it made some way during the Tang (618–907) and the five following dynasties (907–960), it only arrived at its full development under the Sung dynasty (960–1127). It was during this last epoch that a further improvement was made in the art by the introduction of movable types, by a blacksmith named Po Ching. This inventor, writes M. Julien, used to take a paste of fine and glutinous clay, and make of it regular plates of the thickness of a piece of money, on which he engraved the characters. For each character he made a type, which he hardened at the fire. He then placed an iron plate on the table, and covered it with a cement composed of resin, wax, and lime. When he wanted to print, he took an iron frame divided by perpendicular threads of the same metal, and placing it on the iron plate, ranged his types in it. The plate was then held near the fire, and when the cement was sufficiently melted, a wooden board was pressed tightly upon it, so as to render the surface of the type perfectly even. This method was neither convenient nor expeditious, so says a Chinese writer, when only a few copies of a book were to be printed; but when a large number were required, it printed them off at a prodigious speed.

Historical
records.

At this and at later periods the art of printing has been turned to no better purpose in China than to the publication of the histories of the various dynasties. D barred both by the nature of the material at their command and by a lack of original genius from indulging in the higher branches of imaginative writing, Chinese authors have devoted themselves with untiring energy and with very considerable ability to the compilation of information concerning the physical and political features of their own and the neighbouring countries. Each dynasty has its official chronicle of these subjects, and the celebrated collection of twenty-one histories, which forms a well-nigh unbroken record of the nation's annals, by contemporary authors, from the 3d century B.C. down to the middle of the 17th century, forms a notable monument of the indefatigable industry of their authors. The edition of this huge work which stands on the shelves of the Chinese library at the British Museum is contained in sixty-six European-bound volumes of folio size. In order to facilitate the process of reference the different histories of which it is composed, though they vary considerably in extent, are all formed on the same model. First in order come the Imperial Records, which consist of the purely political events which occurred in each reign; then follow the Memoirs, including articles on mathematical chronology, rites, music, jurisprudence, political economy, state sacrifices, astronomy, elemental influences, geography, literature, biographies, and records of the neighbouring countries.

On all these subjects they contain a vast amount of valuable and varied information, much of which possesses considerable interest for European readers. The position which China, as a nation, has occupied and maintained through so many centuries has been such as to render her the natural depository of the annals of the kingdoms of Central and Eastern Asia. With Burma, Cochin-China, Tibet, Japan, and Corea as her vassals, with a never-ceasing relationship with the tribes of Central Asia, kept up as times and circumstances changed, now as subjects, now as allies, and now as enemies, alone unchanging in her political

constitution amidst the recurring wrecks of neighbouring states, she has had the means at her command of collecting masses of ethnological information which are beyond the reach of any other people. The movements of the tribes in Central Asia, to which her policy has largely contributed, are all clearly traced in the dynastic annals; and it was with the view of placing the record of these within the reach of European readers that a proposal was recently made to translate, as a beginning, the history of the Han dynasty.

Allied to these annals are the topographical works of Topo-China, which for breadth of scope and for minuteness of detail are scarcely to be equalled in the literature of any other country. The most generally comprehensive of these is the *Ta Tsing yih tung chi*, which forms a geography of the empire, together with the Chinese districts of Mongolia and Manchuria as existing since the accession of the present dynasty. This work, which consists of 356 books, was published at Peking in the year 1744. In it each province, each prefecture, each department, and each district is separately dealt with; and all are severally treated of under the following twenty-four headings:—1. A table of the changes which the district to be described has undergone during the successive dynasties from the Han downwards; 2. Maps; 3. A list of the distances from the various places to the chief towns of the department; 4. Its astronomical bearings; 5. Its ancient geography; 6. Its geographical position and its notable localities; 7. The manners and customs of the inhabitants; 8. Its fortified places; 9. Its colleges and schools; 10. The census of the population; 11. The taxes on land; 12. Its mountains and rivers; 13. Its antiquities; 14. Its means of defence; 15. Its bridges; 16. Its dykes; 17. Its tombs and monuments; 18. Its temples and ancestral halls; 19. Its Buddhist and Taoist temples; 20. Patriotic native officials from the time of the Han dynasty downwards; 21. Celebrated men and things; 22. Illustrious women; 23. Saints and immortals; 24. The products of the soil.

On this model distinct topographies have also been compiled, under official superintendence, of every province, every prefecture, every department, and almost every district. And not only this, but the water-ways of China, as well as the rivers of Manchuria, Mongolia, and Tibet, have all been accurately surveyed and minutely described. The narrow train of thought, however, into which the system of Chinese education has compressed the mind of the people tends to develop in them a faculty for the observation of minute details rather than to foster the power of taking a correct comprehensive view of any wide subject. This peculiarity is observable in the class of works just spoken of; for while they are wonderfully accurate as to details, their maps and general descriptions are often vague and untrustworthy. But when we remember how only recently the very important duty of causing surveys to be made of the British Islands has been undertaken by the Government, it becomes us rather to speak with respect of the energy and wisdom shown by the Chinese topographers, than to criticise too closely their shortcomings.

It would not be dealing fairly by Chinese literature were we to leave this part of our subject without referring to the historical and literary encyclopædias which form so very notable a feature in every library throughout the country. The best known of these compilations, and the one which may be taken as a specimen of the class, is the *Wān keen tung kaou*, by Ma Twan-lin. This work has been more largely drawn upon by European authors than has any other Chinese book of reference, and those who are best acquainted with it are those who speak most highly in its praise. "One cannot cease to admire," says Remusat, "the depth of research which the author was compelled to

Encyclo
pædias.

make in order to collect his materials, the sagacity he has shown in the arrangement of them, and the clearness and precision with which he has presented this multitude of objects in every light. It may fairly be said that this excellent work is a library in itself, and that if Chinese literature contained nothing else, it would be worth while to learn the language in order to read it. One has only to choose the subject one wishes to study, and one finds all the facts recorded and classified, all the sources of information indicated, and all the authorities cited and discussed. "It elevates our opinion," says Wells Williams, "of a nation whose literature can boast of a work like this exhibiting such patient investigation and candid comparison of authorities, such varied research and just discrimination of what is truly important, and so extensive a mass of facts and opinions upon every subject of historical interest."

In point of size and importance, however, this encyclopædia yields place to one other, entitled *Koo kin too shoo tseih ching*, or *A Complete Collection of Ancient and Modern Books*. During the reign of the Emperor Kang-he (1661-1721) it occurred to that monarch that, in view of the gradual alterations which were being introduced into the texts of works of interest and value, it would be advisable to reprint such from the old editions. He therefore appointed a commission, and directed them to reprint in one huge collection all such works as they might deem worthy of preservation. A complete set of copper type was cast for the undertaking, and when the commissioners brought their labours to a close, they were able to lay before the emperor a very palpable proof of their diligence in the shape of a compilation consisting of 6109 volumes. The contents they divided under thirty-two heads, embracing works on every subject contained in the national literature. Only a small edition was printed off in the first instance, and before long the Government, yielding to the necessities of a severe monetary crisis, ordered the copper type employed to print it to be melted down for cash. Thus only a few copies of the first edition are in existence, and it is but rarely that one finds its way into the market. It so happens, however, that one is now (1876) for sale at Peking, and it is much to be hoped that this copy of a work which is the largest in the world, unique of its kind, and incapable of reproduction, may, though at present fate is adverse, find its way to the shelves of some one of the great libraries of the West.

Taouist
Literature.

Space would fail were we even to refer to the immense number of biographies and of works on the sciences, on education, and on jurisprudence, which have from time to time issued, and are still issuing, from the presses in China. Nor need the literature of the religious sects of China—the Confucianists, the Buddhists, and the Taouists—détain us long, since the works of Confucius have already been noticed, and since the great bulk of Chinese Buddhist literature is of Indian origin. It remains, therefore, for us to refer only to the Taouist literature, which has its foundation in *The Sûtra of Reason and of Virtue* by Laou-tsze, the founder of the sect. Like Confucius, of whom he was a contemporary, he held office at the court of Chow; but being less ambitious than the sage, he retired early from his post, and we are told that as he passed the frontier on his way westward, whither we know not, he placed in the hands of the officer in charge of the frontier guard a small volume, which embodied the results of his meditations. According to the interpretation put upon his system thus expounded by the famous commentator Choo He, it would appear to bear a strong analogy to those of the Quietists and Manicheists. "Laou-tsze's scheme of philosophy," he tells us, "consists in modesty, self-emptiness, in being void of desires, quiet and free from exertion, in being self-empty, retiring, and self-controlling in actual life." But beyond

this his great object seems to have been to elucidate and develop his idea of the relations between something which he calls Taou and the universe. To this Taou, Laou-tsze refers all things as the ultimate ideal unity of the universe. All things originate from Taou, conform to Taou, and to Taou they at last return. Formless, it is the cause of form. It is an eternal road; along it all beings and all things walk; but no being made it, for it is being itself, and yet nothing. It is the path, and also the path-goers, and everything and nothing, and the cause and effect of all.

This is a sufficiently mystical foundation to allow of any superstructures, however wildly superstitious, to be based upon it. And just as the religion of ancient Rome became incrustated and overlaid by superstitious vanities gathered from Egypt, and from wherever the Roman arms penetrated, so the teachings of Laou-tsze have been debased and disfigured in the hands of later writers, who, casting aside his profound speculations, busy themselves with the pursuit of immortality, the search after the philosopher's stone, the use of amulets, with the observance of fasts and sacrifices, rituals and charms, and the indefinite multiplication of objects of worship.

In China, as elsewhere, the first development of literary talent is found in poetry. The songs and ballads which form the *Book of Odes*, already spoken of, date back to a time long antecedent to the production of any works of Odes, which we have knowledge. In those early days, before China was China, the then empire was divided into a number of feudal states, all of which, however, acknowledged fealty to the ruling sovereign, at whose court were a number of music-masters and historiographers, whose duty it was to collect and set to music the songs of the people, and to preserve the historical records of the empire. In strict imitation of the surroundings of their liege lord the feudatory princes numbered among their retinues officers of like position and professing similar functions. At stated intervals these princes, accompanied by their followings, were in the habit of meeting the king at certain recognized places to take orders for the future and to receive credit or blame as the case might be for their past conduct. On such occasions the music masters would carry with them the ballads and songs collected in their principalities, and present them to their superior at the royal court. There he would collect and classify, reminding one of Queen Elizabeth's minister, who, according to the *Spectator*, "had all manner of books and ballads brought to him, of what kind soever, and took great notice how much they took with the people; upon which he would, and certainly might very well judge of their present dispositions, and of the most proper way of applying them according to his own purposes." Thus it happened, that at the time of Confucius there existed an official collection of some 3000 songs. On these the sage set to work, and, in the words of the historian Sze-ma Tseen, "he rejected those which were only repetitions of others, and selected those which would be serviceable for the inculcation of propriety and righteousness." Such he arranged to the number of 311 under four heads, namely, "National Airs," the "Lesser" and the "Greater Eulogies," and the "Song of Homage," and gave the title of *She king*, or *Book of Odes*, to the collection.

If we can imagine ourselves seated in the study of the royal minister, searching with him into the ballads thus laid before us for an indication of the temper and mind of the people among whom they had had their birth, we should be inclined to congratulate him on the easy task entrusted to him of governing such a population. Through most of them there breathes a quiet calm and patriarchal simplicity of thought and life. There are few sounds of war, little tumult of the camp, but, on the contrary, a spirit of peaceful repose, of family love, and of religious

feeling. We have brought before the mind's eye the lowly cottage, where dwell a family united by the bonds of affection and of duty. Their food is the produce of the soil and the spoils of the chase. The highest ambition of the men is to excel as archers and charioteers, and their religious worship is the same as that which, untainted by Buddhism or any other form of philosophical teaching, is now practised at the imperial temples of heaven and earth, by the emperor only as high priest. Their wives are objects of affection and respect, and though in one song we find the belief expressed that "a wise woman will ruin a city," yet there seems to have been abundance of regard for honest housewives who did their duty, who shared the toil of their husbands, and enjoyed with them the simple pleasures within their reach.

It is true that now and again we meet with traces of scenes of revelry bordering on licentiousness; but their idyllic surroundings, and the absence of all violence, deprive the most dissolute descriptions of all vulgarity and coarseness. More serious by far are the wailing complaints of misrule and tyranny under which the subjects of certain princes groan. But even here there are no signs of insubordination or tumult; the remedy which suggests itself to a people patient and long-suffering to a degree is to emigrate beyond the reach of the tyrant, not to rise in rebellion against him. In the following lines, for instance, the writer begs his friends to fly with him from the oppression and misery prevailing in his native state, which he likens to the north wind and thickly falling snow:—

"Cold blows the North wind;
Thickly falls the snow.
Oh come all ye that love me,
Let's join hands and go.
Can we any longer stay,
Victims to this dire dismay!"

Foxes and crows were looked upon as creatures of evil omen, and so, giving play to his imagination, he tells us that the only variations noticeable in the monotony of the present distress were these prognostics of future evil, in these words:—

"Nought red is seen but foxes,
Nor aught else black but crows,
Oh come all ye that love me,
Let's fly before our foes.
Can we any longer stay,
Victims to this dire dismay!"

Though the style and diction of these songs are of the simplest description, yet through some of them there runs a rich vein of sentiment, and in forming a judgment on them it is necessary to remember that they are not studied poems, but simply what they profess to be, songs of the people. Like all political ballads also, many of them refer to contemporary events about which we know next to nothing. We are therefore much in the hands of the commentators, and they tell us that the following song is intended to depict a rural scene, in which an industrious wife impresses on her husband the necessity of early rising, and encourages him to make virtuous and respectable acquaintances:—

"Get up, husband, here's the day!
'Not yet, wife, the dawn's still grey.
Get up, sir, and on the right
See the morning star shines bright.
Shake off slumber, and prepare
Ducks and geese to shoot and snare.

"All yon darts and fine may kill
I will dress for you with skill.
Thus, a blithesome hour we'll pass,
Brightened by a cheerful glass;
While your lute its aid imparts
To gratify and soothe our hearts.

"On all whom you may wish to know
I'll girdle ornaments bestow;
And girdle ornaments I'll send
To any one who calls you friend;
With him whose love for you's abiding
My girdle ornaments dividing."

(*The Book of Odes*, pt. i. bk. vii. Ode 8.)

One other we will quote, taken from the songs of homage, or hymns which were sung either by or before the emperor when he sacrificed as high priest to God. We are told that this one was sung by King Senen on the occasion of a great drought in the 8th century B.C. In it he expostulates with God for bringing this misery upon him, and expresses his belief that he had a right to expect succour instead of disaster from the Most High.

"Brightly resplendent in the sky revolved
The milky way.

The monarch cried, Alas!
What crime is ours, that Heaven thus sends on us
Death and Disorder, that with blow on blow
Famine attacks us!

Surely I have grudged
To God no victims; all our store is spent
Of tokens. Why is it I am not heard?
Rages the drought. The hills are parched, and dry
The streams. The demon of the drought
Destroys like one who scatters fiery flames.
Terrified by the burning heat my heart,
My mourning heart, seems all consumed with fire.
The many dukes and ministers of the past
Pay me no heed.

O God! from Thy great Heaven
Send me permission to withdraw myself
Into seclusion.

Fearful is the drought.
I hesitate, I dread to go away.
Why has the drought been sent upon my land?
No cause for it know I. Full early rose
My prayers for a good year; not late was I
In offering sacrifice unto the Lords
Of the four quarters and the land.

Afar
In the high Heaven God listens not. And yet
Surely a reverent man as I have been
To all intelligent Spirits should not be
The victim of their overwhelming wrath."

(*The Book of Odes*, pt. iii. bk. iii. Ode 4.)

Such is the poetry of the *Book of Odes*, and such we should have expected to find it, since the earliest specimens of poetry in every land partake of a simple and religious nature, are crude in their measure, and are wanting in that harmony which is begotten of study and cultivation. The Chinese say of poetry that the *Book of Odes* may be likened to its roots, that during the Han and Wei dynasties it burst into foliage, and that during the Tang dynasty (620-907) it came into full bloom. Certainly the change later that came over it after the time of Confucius is very poetry marked. Instead of the peaceful odes of his day, we find pieces reflecting the unsettled condition of political and social affairs. Songs breathing fire and sword, mingled with wild fancies, the offspring of Taoist teaching, have taken the place of the domestic ballads of the *Book of Odes*. The simple monotheistic belief of the early Chinese is exchanged for a superstitious faith in a host of gods and goddesses, who haunt every hill, and dance in every glade. As a specimen of the poetry of this period, we may quote the following "Lament of a Soldier on a Campaign," by Sun Tse-king, of the Wei dynasty:—

"On the hilly way blows the morning breeze; the
Autumn shrubs are veiled in mist and rain.
The whole city escorts us far on our way, providing us
with rations for a thousand li.
Their very worst have the three Fates done. Ah me!
How can I be saved? There is naught more
bitter than an early death. Do not the Gods desire
to gain perpetual youth!"

As Sorrow and Happiness, so are Fortune and Misfortune intermingled. Heaven and Earth are the moulds in which we are formed, and in them is there nothing which does not bear significance. Far into the future looks the sage, early striving to avert calamity. But who can examine his own heart, scrutinize it by the light of heaven, regulate it for his present life, and preserve it for the old age which is to come?

Longer grows the distance from what I have left behind me: my trouble is greater than I can bear."

With other poets this new phase of belief encouraged a contempt for life, and an uncertainty of all beyond it; and these during the first two centuries gave vent to their indifference in odes advocating the Epicurean philosophy, "Let us eat and drink, for to-morrow we die." Eight short dynasties, times of confusion and disorder, followed after the Han dynasties (206 B.C. to 221 A.D.) and then came the Tang dynasty (620-907), a period which is looked back upon as being the golden age of literature, as, indeed, it was in every field which marks a nation's greatness. It was during this epoch that imperial armies occupied Bokhara and Samarcand, that the Buddhist traveller Hsuen-tsang made his way to India, and to every spot rendered sacred by the presence of Buddha, and that the softening influences of Christianity were introduced by the Nestorians into the very heart of the empire. It was a time of prosperity and peace. Literature flourished, and skill and art were employed to soften and add harmony to the national poetry. The four syllables, of which nearly all the lines in the *Book of Odes* were composed, were exchanged for five and seven. The subjects also partook of the change. Le Tai-pih, the greatest poet of his time, tuned his lyre to notes on the pleasures of wine and of beauty, which would have done honour to Anacreon. Evening feasts amid the parterres of gardens rich with the bloom of a thousand flowers furnished themes upon which he and his imitators were never tired of dilating. Such sonnets are sometimes pretty, and occasionally the ideas they contain are striking; but the disadvantages of the language and of education weigh heavily upon their authors, and they seldom rise beyond the level of the merest mediocrity. The following is taken from the writings of the poet just mentioned, and is translated *lineatum et verbatim* :—

A Solitary Carouse on a Day in Spring

"The east wind fans a gentle breeze,
The streams and trees glory in the brightness of the Spring.
The bright sun illuminates the green shrubs,
And the falling flowers are scattered and fly away.
The solitary cloud retreats to the hollow hill,
The birds return to their leafy haunts.
Every being has a refuge whither he may turn.
I alone have nothing to which to cling.
So, seated opposite the moon shining o'er the cliff,
I drink and sing to the fragrant blossoms."

Of epic poetry the Chinese know nothing, and this need not surprise us when we remember how entirely that style of writing was an importation from Greece into Western Europe; and Voltaire tells us that, when he was thinking of publishing the *Henriade*, he consulted a friend on the subject, who recommended him to give up the undertaking. "for," said he, "the French have not epic heads." Neither have the Chinese. A sustained effort of imagination is difficult to them, and the strict laws of rhyme and metre which hamper the poet would make a lengthened poem in Chinese the work of a lifetime. It is probably due to this cause that the literature shows no instance of real dramatic poetry. Their dramas abound with short lyrical pieces, which are introduced to break the monotony of the dialogue; but dramas in verse are unknown, except in the case of low plays written in vulgar rhythm. As, however, love for the drama is one of the most noticeable features of the

Chinese character, every encouragement has been given to playwrights, and this branch of literature is therefore well supplied both as regards matter and bulk. The most celebrated plays are contained in a collection entitled *The Hundred Plays of the Yuen Dynasty*, many of which have been translated into European languages, and one of which, *the Orphan of Chao*, served as the groundwork of Voltaire's tragedy, *L'Orphelin de la Chine*. Their dramas are divided in the playbooks into acts, generally four or five, but as there is an absence of all scenery, and as the dramas are never changed during the piece, the acting is as a rule continuous throughout without break or interval. The stage directions are given in their books as in ours, but not with the same minuteness. "Enter" and "exit" are expressed by "ascend" and "descend," and "aside" by "turn the back and say." By the rules of the Chinese, as was the case also in the Greek drama, only two players are allowed to have possession of the stage at any one time. This, and the absence of all scenery, obliges the dramatist to put in the mouths of the actors long pieces of spoken narrative, much after the manner of the prologues in the plays of Euripides, which appear tame and heavy to a European spectator accustomed to have the plot and locality explained by dialogue and scenery. The plots are for the most part simple and well sustained. The unities, though sometimes observed, are more often disregarded, especially that of place, the characters being frequently sent to different parts of the country in the same act, and made to inform the audience of their whereabouts by the simple expedient of walking up and down the stage, and exclaiming, "Now I am at such and such a place," or "at such and such a house." The acting, generally speaking, is good. The Chinese are actors by nature, and are no doubt a good deal improved by their inherent cunning and want of sincerity, which make them quick of observation and fertile in resource, and in every-day life enable them easily to catch the tone of those with whom they associate, and on the stage to assume the characters they wish to represent.

The theatre in China, as it was in Greece, national and religious. It is under the direct control of the law, and is closed by imperial edict during all periods of public mourning, while at the same time it plays a prominent part at all the yearly religious festivals. In order to give some idea of the substance and plot of a Chinese drama, we will quote from Sir John Davis's *China* an abstract of a play, which he has translated and published at full length, entitled *The Heir in Old Age*. This piece serves, as is observed by the translator, to illustrate the consequences which the Chinese attach to the due performance of the obligations at the tombs of departed ancestors, and also the true relation of the handmaid to the legitimate wife. The *dramatis personae* are, he says, "made up entirely of the members of a family in the middle class of life, consisting of a rich old man, his wife, a handmaid, his nephew, his son-in-law, and his daughter." The old man, having no son to console him in his age, and to perform the obsequies at his tomb, had, like the Jewish patriarch, taken a handmaid, whose pregnancy is announced at the opening of the play, in which the old man commences with saying, "I am a man of Tung-ping Foo," &c. In order to obtain from Heaven a son, instead of a daughter, he makes a sacrifice of sundry debts due to him, by burning the bonds, and this propitiatory holocaust serves at the same time to quiet some scruples of conscience as to the mode in which part of his money had been acquired. He then delivers over his affairs to his wife and his married daughter, dismissing his nephew (a deceased brother's son) with a hundred pieces of silver to seek his fortune, as he had been subjected at home to the persecution of the wife. This done, the old man sets out for his estate in the country, recommending the mother

of his expected son to the humane treatment of the family, and with the hope of receiving from them speedy congratulations on the birth of a son.

The son-in-law now betrays to the daughter his disappointment at the expected birth, since, if it prove a girl, they shall lose half the family property, and if a son, the whole. His wife quiets him by a hint how easily the handmaid may be got rid of, and the old man persuaded that she had suddenly disappeared; and shortly afterwards both the son-in-law and the audience are left to infer that she had actually contrived to make away with her. In the mean time the old man waits the result in great anxiety; his family appear in succession to console him for the loss of his hopes. In the bitterness of his disappointment, he bursts into tears and expresses his suspicions of foul play. He then attributes his misfortunes to his former thirst for gain, resolves to fast for seven days, and to bestow alms publicly at a neighbouring temple, in the hope that the object of his charity may treat him as a father. Among the beggars at the temple his nephew appears in the most hopeless state of poverty, being reduced to take up his lodgings under the furnace of a pottery; he is insulted by the son-in-law, and reproached by the old wife, but his uncle, moved with compassion, contrives to give him a little money, and earnestly advises him to be punctual in visiting the tombs of his family at the approaching spring, assuring him that a due attention to those sacred rites must ultimately lead to prosperity. It is on the importance attached to the sepulchral ceremonies that the whole drama is made to turn.

The nephew accordingly appears at the tombs, performs his oblations as well as his poverty will admit, and invokes the shades of his ancestors to grant him their protection. He no sooner departs than the old man appears with his wife, expressing their indignation that their own daughter and son-in-law had neglected to come with the customary offerings. They observe, from the appearances at the sepulchre, that their nephew must have been there. The scene at the tombs, and the reflections of the old man thereon, have considerable interest; he reasons with his wife, and convinces her that the nephew is nearer in blood and more worthy than the son-in-law; she relents, and expresses a wish to make him reparation; he appears, and a reconciliation takes place, and he is received back into the family. The son-in-law and daughter now enter with a great bustle and a procession, to perform the ceremonies, but are received with bitter reproaches for their tardy piety and ingratitude, and forbidden to enter the doors again.

On the old man's birthday, however, they claim permission to pay their respects, when, to the boundless surprise and joy of the father, his daughter presents him with the long-lost handmaid and child, both of whom, it appears, had been secreted by the daughter, unknown to her jealous husband, who supposed they were otherwise disposed of. The daughter is taken back, and the old man divides his money in three equal shares, between her, his nephew, and his newly-found son,—the play concluding with expressions of joy and gratitude that the venerable hero of the piece had obtained an "heir in his old age."

This play furnishes us with a very good type of Chinese plays in general. The incidents are true to life, but they have no psychological interest about them. There is no delineation of character in it, and there is nothing in the plot to make it more appropriate for the groundwork of a play than for that of a novel. In the works of fiction we are treated only to the same crude narration of facts, without any just representation of nature. Exaggerated sentiments, which always precede correct reasoning and refined simplicity, fill the pages of their works of fiction, rendering them favourites only with those who are taught

to judge of them according to their own standard of taste. Of the characters portrayed, we have to judge only from actions attributed to them, which are strung together with no connecting links, except those supplied by the iteration of details, which are wearisome to a degree. Several novels have been translated into English by Sir John Davis and others; but, from the causes I have described, few have attracted any public interest. Some of their shorter tales, being to a great extent purged of the cumbrous repetitions common to larger works, are better fitted for translation, and the novelty of many of the situations and incidents serves to keep alive the attention of the reader. Unfortunately the tone of most Chinese novels is not such as to afford any palliation for the droariness of their contents. If Chinese novelists are to be believed, virtue in women and honour in men are to be found only in a few rarely-gifted individuals, and this has been so constantly insisted on, that it appears to have become one of those beliefs which have been the means of their own justification.

If then, having considered the past and present literature of China, we cast a glance into the future, the prospect is not encouraging. Already every subject within the scope of Chinese authors has been largely treated of and infinitely elaborated. Every grain of wheat has long ago been beaten out of it, and any further labour expended upon it can but be as thrashing out of straw. The only hope for the future of the literature is that afforded by the importation of foreign knowledge and experience into the country. For many years these can only be introduced in the shape of translations of books. But the time will come when Chinese authors will think for themselves; and when that period arrives, they will learn to estimate their present lonly-vaunted literature at its true value.

Government.

The government may be described as a patriarchal despotism. The emperor is the father of his people, and as a father is responsible for the training and behaviour of his children, receiving blame when they prove unworthy, and reward when they show themselves to be virtuous; so is the people's welfare the emperor's first care, and their preservation from all harm, both moral and physical, his first duty. When the people become unruly the emperor views their conduct as the result of his own negligence or want of wisdom, and when peace prevails he accepts it as the consequence of his fatherly solicitude and care. Like a father, also, he holds autocratic sway over his household,—the empire. In his hand lies the power of life and death. Whom he will he slays, and whom he will he keeps alive. But there is a limit to his absolutism. The duties attaching to the relations existing between emperor and people are reciprocal; and, while it is the duty of the subject to render willing and submissive obedience to the sovereign so long as his rule is just and beneficent, it is also incumbent on him to resist his authority so soon as he ceases to be a minister of God for good. This sacred right of rebellion was distinctly taught by Confucius, and was emphasized by Mencius, who went the length of asserting that a ruler who, by the practice of injustice and oppression, had forfeited his right to rule, should not only be dethroned, but might, if circumstances required it, be put to death.

All this carries us back to a very primitive state of society—to one which probably existed among the Chinese immigrants who first settled on the plains of China, and which has been perpetuated down to the present day unaltered and without interruption. That among the changing fates of empires this system should have been so accurately maintained in China through so many centuries is a fact into the causes of which it is worth while to inquire. We find it pictured in the records which make up

the *Book of History*, the earliest of which carry us back to the time of Noah, and we find it enforced in the writings of the great apostle of patriarchal institutions, Confucius, and in all the other works which go to make up the nine classics. The reverence with which these Scriptures are viewed has been the principal means of perpetuating the primitive form of Chinese imperialism. The contents of their pages form the study of every schoolboy, and supply the only themes at the competitive examinations through which every one must pass who seeks an official career. Thus the mind of the nation is constantly and almost exclusively turned towards them, and their dogmas have become part and parcel of the national training. The isolation in which China, owing to her geographical and political position, has been wrapt for so many centuries has prevented the introduction of foreign opinions and literature, and the national mind has been so emasculated by the constant contemplation of these ready-made models of excellence, that neither from without nor from within has there been any temptation to Chinamen, by the creation of new ideas, on this or any other subject, to dissent from the dicta of Confucius and his predecessors, and the result has been that such as the government was in their time so it is at the present day.

The whole theory of government is the embodiment of parental and filial piety. As the people are the children of the emperor, so is he the *Teen-tsz* or the Son of Heaven; and standing in this intermediary position, it pertains to him, and to him alone, to mediate between his father, Heaven, and his children, his subjects. His sacrifices and prayers to Heaven are conducted with great parade and ceremony. The chief of these state observances is the sacrifice at the winter solstice, which is performed before sunrise on the morning of the 21st of December at the altar of Heaven. The form of this altar is peculiar. "It consists of a triple circular terrace, 210 feet wide at the base, 150 in the middle, and 90 at the top. . . . The emperor, with his immediate suite, kneels in front of the tablet of Shang-ti (The Supreme Being, or Heaven), and faces the north. The platform is laid with marble stones, forming nine concentric circles; the inner circle consists of nine stones, cut so as to fit with close edges round the central stone, which is a perfect circle. Here the emperor kneels, and is surrounded first by the circles of the terraces and their enclosing walls, and then by the circle of the horizon. He then seems to himself and to his court to be in the centre of the universe, and turning to the north, assuming the attitude of a subject, he acknowledges in prayer and by his position that he is inferior to Heaven, and to Heaven alone. Round him on the pavement are the nine circles of as many Heavens, consisting of nine stones, then eighteen, then twenty-seven, and so on in successive multiples of nine till the square of nine, the favourite number of Chinese philosophy, is reached in the outermost circle of eighty-one stones." On this occasion, also, a bullock of two years old, and without blemish, is offered as a whole-burntoffering in a green porcelain furnace which stands close beside the altar.

But though occupying the lofty position described, the power wielded by the emperor of China is circumscribed by ceremonial laws and hampered by precedents. His whole life is one continual round of ceremonial observances. From the day on which he ascends the throne to the time when he is carried to his tomb in the Eastern Hills, his hours and almost minutes have special duties appointed to them by the Board of Rites. He never leaves his palace except on state occasions, and every relaxation from the cares of sovereignty must therefore be found within its walls. It is thus that the temptations of harem life have been the ruin of so many emperors, and it is rarely the case that such sovereigns are to be met with as Kang-he

and Keen-lung, who reigned in the last two centuries, and each of whom devoted the sixty years of his reign to the high duties of his position and to the charms of literary pursuits.

In all affairs of state the emperor is assisted in his deliberations by the *Nuy ko*, or privy council, which, according to the regulations of the present dynasty, consists of nine Manchos and seven Chinamen; and the administrative departments are presided over by six boards, namely, the Board of War, the Board of Punishments, the Board of Office, the Board of Ceremonies, the Board of Revenue, and the Board of Works. Besides these there are the Board of Music and that of the Censors; and this last, though an inferior office, exercises considerable influence, since its officers, both in the capital and in the provinces, are encouraged to criticise freely the actions of the mandarins and even of the emperor himself. Like many of the other branches of Government, this one has fallen a victim to a great extent to the corruption which prevails throughout all the departments, but it is still at times instrumental in bringing to light official misdeeds; and only lately a general in command of an army, acting against the Mahometan rebels in North-Western China, was degraded and dismissed from his post for crimes with which he was first charged by a censor.

The provincial governments are mainly self-governed. Each province (in a few cases, two conjointly) is presided over by a viceroy, who is supreme within his jurisdiction, and who has, in cases of emergency, the power of life and death in his hands. Next to him comes the governor, whose authority in all matters relating to the province is second only to that of the viceroy. After these two officials the treasurer holds the highest rank. He controls the finances of the whole province, receiving the taxes and paying the salaries of the mandarins. The judge, the salt commissioner, and the grain collector are the only other mandarins whose authority extends over the whole province, the remaining officials being charged with the government of the various divisions into which the provinces are divided. The chief of them is the *Taou-tai*, or intendant of circuit, who has a direct general superintendence over all the affairs of the circuit intrusted to his charge. Each circuit is divided into a number of prefectures and sub-prefectures which are administered by prefects and sub-prefects, and these, again, are subdivided into districts over each of which is placed a magistrate. Subordinate to this last-named officer are a host of petty officials, among whom the coroner is one of the most important. Each province collects its own taxes, pays its own expenses, and supports its own army and navy. Its officials are held responsible for the preservation of peace within its borders, and are compelled to contribute a fixed sum annually to the expenses of the Peking Government. Mandarins of all classes are divided into nine ranks, each distinguished by the button worn on the top of the cap. These buttons follow thus in order of superiority—first and highest, a plain red button; second, a flowered red button; third, a transparent blue button; fourth, an opaque blue button; fifth, an uncoloured glass button; sixth, a white glass button; seventh, a plain gilt button; eighth, a gilt button, with flowers in relief; ninth, a gilt button, with engraved flowers. These buttons are no indication of the office held by their wearers, but simply of their rank. The peacock's feather, again, which is worn in the hats, has nothing to do with either the office or the rank of the wearer, but is like the European orders, and is specially granted to individuals as a reward for merit.

Theoretically the system of government in the provinces is excellent, but as a matter of fact it is corrupt to the core. Several causes have tended to bring about this

disastrous state of things. In the first place, the mandarins, even when they receive their salaries, which is by no means always the case, are so wretchedly underpaid that the money they receive from this source is barely sufficient to support the staff which it is necessary for them to maintain. A district magistrate, for instance, is supposed to receive about £275 per annum, a prefect about £685, and an intendant of circuit about £1035. The pay of the higher officers varies in different parts of the empire. The salary of the viceroy of the two provinces, Kwang-tung and Kwang-se, is said to be about £9000 a year. The consequence is that, as few mandarins have private means, they are obliged to supplement their official incomes by illegal exactions and bribes. And this evil is further heightened by the regulation which forbids that a mandarin should hold any office for more than three years. It becomes the selfish interest, therefore, of every office-holder to get as much out of the people within his jurisdiction as he possibly can in that time. The instant he arrives at his post it is customary for all the subordinate officials to pay their respects to him, on which occasion they are expected to display their loyalty by offering presents of more or less value according to the means at their command. No subaltern dare absent himself, being perfectly aware that such an omission of duty would deprive him of all hope of promotion, and would subject him on the slightest pretence, or even without any pretence whatever, to official persecution and ruin. Then, again, when a suitor comes with a legal cause to the Yamen, or mandarin's office, he is obliged to see the mandarin, and all the subordinate officials, the secretary, the police, and the doorkeeper, in proportion to his wealth, or otherwise his chance of gaining a hearing would be very small indeed. In a great many cases also the bribery goes beyond the preliminary fee. In an officialdom, where illegal exactions are recognized, it would be impossible to suppose that the stream of justice should be pure, and a limited acquaintance with the practices of Chinese Yamens is enough to verify the common belief that justice is bought and sold, and that a suitor's chance of success is in proportion to his wealth.

As may readily be imagined, this corruption in high places has a most demoralizing effect on the people generally. Dishonesty prevails to a frightful extent, and with it, of course, untruthfulness. The Chinese set little or no value upon truth, and thus some slight excuse is afforded for the use of torture in their courts of justice; for it is argued that where the value of an oath is not understood, some other means must be resorted to to extract evidence, and the readiest means to hand is doubtless torture. The kind most commonly inflicted is flogging. The obdurate witness is laid flat on his face, and the executioner delivers his blows on the upper part of the thighs with the concave side of a split bamboo, the sharp edges of which mutilate the sufferer terribly. The punishment is continued until the man either supplies the evidence required or becomes insensible. *Numberless* other forms of torture are occasionally resorted to, such as tying the witness up to a beam by his thumbs and big toes, squeezing his fingers between pieces of bamboo, &c.; and these, of course, vary both in kind and severity, according to the disposition of the presiding mandarin. Theoretically every safeguard is adopted to secure for the public service only officers of enlightened and refined dispositions. The law ordains that every man who wishes to obtain Government employment must qualify himself for office by passing the prescribed competitive examinations; and as there is, speaking generally, no hereditary nobility nor any class equivalent to *English country gentlemen*, office supplies the only distinguishing rank in the empire.

The consequence is that it is sought after by all except those who engage in trade. Thus the Government has the cream of the national talent at its disposal, and if posts were only given to the foremost men at the examinations as the law provides, no system could be better, and when it has been carried out China has reaped the benefits of it. Unfortunately, however, it has constantly happened that when the Government has been embarrassed by want of money, offices have been put up for sale, and thus the man who has the longest purse steps into the post of honour; and if, as must often happen, he should chance to be cruel as well as unenlightened, unjust as well as ignorant, woe betide the people under him. One great defect in the competitive system in China is that there is no limit to the number of candidates, nor to the age when they may go up for examination, and the result is that, what with the surplus victors and the unsuccessful aspirants who go on trying year after year until they become grey-haired old men, there exists a large non-producing class in the community which acts as a dead weight on the national prosperity.

It is only natural to expect that in a country where the torture of witnesses is permitted, the punishments inflicted on the guilty should exceed in cruelty, and this is eminently the case in China. The Mongolian race is confessedly obtuse-nerved and insensible to suffering, and no doubt Chinese culprits do not suffer nearly as much as members of more sensitive races would under similar treatment. But even granting this, the refined cruelties perpetrated by Chinamen on Chinamen admit of no apology. Not long since, for instance, at one of the Treaty Ports, an offender was placed in a cage, through the top of which his head protruded, and which was just long enough to allow the tips of his toes to touch the ground. In this position, hanging as it were by his neck, with just enough support from his feet to prevent his neck dislocating, the wretched man remained for days, the object of the jeers and laughter of the passers by, until starvation and exhaustion put an end to his sufferings. As punishments for heinous offences such cruelties would be sufficiently shocking, but the fact that this and kindred tortures are not unfrequently inflicted for very insignificant crimes, and sometimes even to gratify the malice or the greed of the officiating mandarin, is significant of a strangely callous indifference in the Chinese nature to the sufferings of others. For capital offences the usual modes of inflicting the extreme penalty of the law are—in bad cases, such as parricides, “cutting to pieces,” and for less aggravated crimes either strangulation or decapitation. The culprit who is condemned to be “cut to pieces” is fastened to a cross, and while thus suspended cuts are made by the executioner on the fleshy parts of the body, and he is then beheaded. Strangulation is reserved for offenders of high rank, it being considered a privilege to pass out of life with a whole body. When it has been granted to a criminal thus to meet his end, a silken cord is sent to him in prison. No explanatory message is considered necessary, and he is left to consummate his own doom. Sometimes, of course, the prisoner's nerve forsakes him at the supreme moment, as was the case with a prince of the blood, who in 1861 was presented with a silken cord for treason. This imperial personage could not make up his mind to be his own executioner, and it became necessary to call in the jailers to carry out the sentence of the law. Decapitation in China is a very speedy death, and were it not that popular sentiment regards it as a peculiarly disgraceful end, it would be a very merciful one. Constant practice makes the executioners wonderfully expert in the performance of their deadly office. No block or resting-place for the head is used. The neck is simply outstretched to its full length by the aid of an assistant, and one blow invariably leaves the body headless.

Torture.

Government
offices.

Social and Domestic Life.

But side by side with all these horrors there is a vast deal of quiet, happy, domestic life in China. It is not every one who gets into the clutches of the mandarins and their satellites, and as long as a man is loyal to the powers that be, and is not over rich, he may expect to be left alone in undisturbed enjoyment of the pleasures within his reach. And in the ordering of a Chinese household there is much that might be imitated with advantage by European families. The duty of filial piety, which is the final object of Chinese religious teaching, represents much more than the ceremonial observances which outwardly mark its performance. The reverence with which children are taught to regard their parents fosters the affection of which this reverence is the outward and visible sign, and the peace of each household is assured by the presence of a supreme authority, against whose dicta there is no appeal. Although sons very generally remain under their fathers' roofs after they are married and have themselves become fathers, yet so impossible would it be for a young Chinaman to rebel against, or even to dispute with, his parent that difficulties seldom arise from this close association of several generations. The patriarchal system of family life is dear to the heart of every Chinaman, and when his time comes to die, death loses to him half its terrors if he is assured that his sons will be present at his tomb to perform the customary rites and to offer the prescribed sacrifices. It is his belief that the peace of his soul depends on the due celebration of these posthumous observances, and if he has no son present to officiate, to whom can he look for the performance of them?

It is mainly due to this cause that early marriages are almost universal in China. Like the Jews of old, the Chinese look upon the possession of children, especially of sons, as the chief blessing of life, and consequently as soon as a young man comes of age his parents cast about to find a helpmate for him. The would-be bridegroom has very little to say in the matter. Marriage is not the result of acquaintanceship ripening into affection, as amongst Western nations. The bridegroom rarely sees his betrothed until she has become his wife. The preliminaries are entirely arranged by a professional "go-between" or "match-maker," who makes it her duty to acquaint herself with all the marriageable young people of both sexes in the neighbourhood. When employed by the bridegroom's friends she calls on the parents of some young lady who she considers would make a suitable wife for the future bridegroom, armed with a card on which are inscribed the ancestral name, and the eight symbols which denote the year, month, day, and hour of the birth of the suitor. Should the lady's parents be inclined to accept the proposal they consult a fortune-teller as to the future prospects of such a union. If the answer be favourable a return card is given to the go-between, and this in turn is submitted to the scrutiny of a fortune-teller employed by the man's parents. Should the oracles prophesy good concerning the match the bridegroom prepares two large cards on which are written the particulars of the engagement; and on the outer side of the one which he keeps is pasted a paper dragon, and on the one which is sent to the lady, a phoenix, — emblems of conjugal fidelity. Each card is further sewn together with two pieces of red silk. Legend traces the original of these silken cords to the time of the Tang dynasty (618-907). During that period, it is said that a man named Hwuy Ko, while staying at the town of Sung, saw one evening an old man reading a book by the light of the moon, who addressed him thus: "This book is the register of the engagements of marriage for all places under heaven, and in my pockets I have red cords

with which I tie together the feet of those who are destined to become man and wife. When this cord has been tied, though the parties are of unfriendly families, or of different nations, their fates are fixed. Your future wife," said he, "is the child of the old woman who sells vegetables in yonder shop on the north." Upon hearing this Hwuy Ko started off in search of the old woman, and found her possessed of such a hideous little infant of about twelve months old, that in despair he hired a man to kill the child. Years afterwards the prefect of a neighbouring district gave Hwuy Ko in marriage a beautiful young lady whom he affirmed to be his own daughter. Seeing that his bride always wore an artificial flower over her eyebrow, Hwuy Ko asked her the reason of her doing so. "I am the daughter," she replied, "of the prefect's brother who died at Sung when I was an infant, leaving me to the care of an old woman who sold vegetables. One day, when I was out with her in the street a ruffian struck me on my eyebrow, and made such a scar that I am obliged to wear this flower to conceal it." On hearing this Hwuy Ko recognized the immutability of fate, and from that time forward red silken cords have been entwined in the marriage cards of every pair in China. Following the exchange of cards, presents of more or less value according to the wealth of the contracting parties pass between the two households, and at last when the happy day has arrived, the bride, surrounded by her friends, starts from her father's house in a sedan chair for her future home. Half-way between the two houses she is met by a party of the bridegroom's followers, who escort her the rest of the way. In this custom it is impossible not to see a survival of the primitive custom of marriage by capture. At the present day, in some parts of Central Asia, the bride rides off on horseback at full gallop from the door of her father's house or tent, followed by the bridegroom, who, after an exciting chase, is allowed to come up with her, and she straightway becomes his property. Among some of the Siberian tribes, again, the bridegroom is obliged to hunt his bride through the compartments of her father's tent, while old women go through the farce of tripping him up and otherwise hindering him in his pursuit. In more civilized China there are fewer traces of the ancient capture, and the contest has there become but a formal act of taking over the bride on her way to the bridegroom's house. On alighting from her sedan chair she is led with her head covered into the room where her future husband awaits her. Without exchanging a word they sit down side by side, and each tries to sit on a part of the dress of the other, it being considered that the one who succeeds in so doing will rule in the household. After this silent trial of skill they adjourn to the reception hall, where stands the family altar, and there they worship Heaven, and Earth, and their ancestors. This done, they drink a glass of wine together, when for the first time the bridegroom is allowed to see the face of his bride. Here the marriage ceremony ends, and the guests give themselves up to feasting and rejoicing.

Like many other apparent paradoxes, the co-existence of infanticide with an universal desire for children among the Chinese admits of a ready explanation. The chief object of desire is the possession of sons, and in the parts of the country where infanticide exists—and this is the case only in poverty-stricken households in certain districts of certain provinces—female infants are the only victims. In some parts of the province of Fuh-keen the people make no attempt to conceal the existence of the practice, and even go the length of defending it. What is the good of rearing daughters, they say; when they are young they are only an expense, and when they reach an age when they might be able to work for their own living, they marry and leave us. But even the poorest people

nourish and cherish their sons. Their labour soon becomes remunerative, they support their parents in their old age, and when these are gathered to their fathers they perform the prescribed observances at their tombs,—offering sacrifices at fixed periods to the souls of the departed, and keeping the tombs in repair. Should anything interfere with the repose of the dead, the living may expect to be visited with misfortune; and to allow the soul of a parent to pass between its tomb and the households of the descendants, the entrance to the grave must be kept unimpeded. Curiously enough, the tombs, especially in the south of China, are all made in the shape of an Ω. This is probably an importation from the West.

Religion.

The principal religions of China are Buddhism, Taoism, and Confucianism, to which must be added Mahometanism in the northern and western provinces of the empire. Buddhism was introduced from India during the 1st century of the Christian era; and thus coming at a time when the national mind had been prepared by the teachings of Confucius and the mysticisms of Laou-tze for the reception of a religious system which should satisfy the requirements of its higher nature, the new faith spread rapidly through the country, and at the present day numbers more adherents than either of the other two leading religions. Laou-tze, who was the founder of the Taoist sect, was a contemporary of Confucius. Like that sage also, he held offices at the court of Chow, but being disheartened at the want of success attending his efforts to reform the manners of the age, he retired into private life and devoted himself to the composition of *The Sâtra of Reason and Virtue*. In this work he enunciated a scheme of philosophy which bears a strong analogy to the doctrines of the Quietists and Manichæists, the leading point being the relation between something which he calls *T'ao* and the universe. The philosophical bearing of his system was, however, soon lost sight of and his profound speculations were exchanged for the pursuit of immortality and the search after the philosopher's stone by his followers. But while Buddhism and Taoism find their adherents among the common people, Confucianism is *par excellence* the religion of the learned. The opinions and teachings of the sage are their constant study; and at stated periods they assemble in temples devoted to his honour to worship at the shrine of the "Throneless King." But the process of decay, which has been going on for so many centuries in the distinctive features of these creeds, has served so to obliterate the lines of demarcation which originally separated them, that at the present day the dogmas of Buddha and Laou-tze and the teachings of Confucius may, as far as the masses are concerned, be treated as the foundations of a common faith.

Education.

Education is probably more widely spread among the male population in China than in any other country. Being the only high road to honour and emolument it is eagerly sought after by all who are desirous of following an official career, while the universal respect for letters which has become a national tradition encourages all of every degree to gain at least a smattering of learning—except the women. Very little trouble is taken with the education of girls. If they are taught to be good needle-women and expert cooks, if they learn to act modestly and to show due deference to their superiors, little more is as a rule required of them. But it is very different with the men. No one can hold any Government office unless he has passed at least the first of the three great literary competitive examinations, and the whole education of boys is arranged with the object of enabling them to pass successfully through these ordeals. Unfortunately for the real education of the aspirants to office, the only subject required of them is a knowledge of the Nine Classics, and the result is that from childhood upwards these works are the only

text-books which are put into the hands of Chinese school-boys. These they are taught to regard as the supreme models of excellence, and any deviation either from the opinions they contain or from the style in which they are written, is looked upon as heretical. The result is that there have grown up in China generation after generation of men who have learned to elevate mere memory above genius, and whose mental powers have been dwarfed by servile imitation and by the paltry literalism of the schools.

Turning to the every-day customs and manners of the Chinese, it is passing strange to find how diametrically opposed they are to what we are familiar with. In a country "where," as has been said by Wingham Cook, "the roses have no fragrance, and the women no petticoats; where the labourer has no Sabbath, and the magistrate no sense of honour; where the needle points to the south, and the sign of being puzzled is to scratch the antipodes of the head; where the place of honour is on the left hand, and the seat of intellect is in the stomach; where to take off your hat is an insolent gesture, and to wear white garments is to put yourself into mourning," it would at first sight seem useless to seek for any point of similarity with ourselves. But it is extremely probable, for instance, that the choice of the left as the seat of honour is in principle entirely at one with our custom of considering the right hand as the place due to the most highly-honoured guest, and that both are survivals of the ancient and almost universal adoration of the sun. The needle of the Chinese compass points towards the south, and every house in China of any pretensions faces the same way, as well as the state seats in all reception rooms. The place on the left of the host, therefore, is that nearest to the light-bringing, life-producing East, and hence its title to honour; and in the same way the opposite custom among ourselves is susceptible of a like interpretation. In daily life the Chinese are frugal, sober, and industrious. Their wants are few, and they are easily satisfied. The poorer classes live almost entirely on rice and vegetables, to which they sometimes add small pieces of fish or meat. Their clothes are of the cheapest kind, and they are so accustomed to crowded apartments that house rent forms an insignificant item in a Chinaman's expenditure. Thus a Chinaman can live where a European would starve, and it is on account of the advantages which he thus possesses, combined with sobriety and frugality, that he is able to underbid the American workmen in California, and the English colonist in Australia, in almost every branch of industry. The over-populated condition in which China has been for so many centuries has had a powerful influence in thus moulding the national character. Vast as China is, it cannot contain all those who call themselves her sons and daughters, and in many cities a large section of the inhabitants are driven to live in boats on the neighbouring rivers and lakes. It would be very difficult to say how the boat population provide food for themselves and their families; indeed, were it not for the extreme cheapness of their ordinary daily food, and for their sober habits, they could not do so. Spirits—they have no wine—appear to have no great attraction to Chinamen. They drink them occasionally, and sometimes to excess, but a reeling Chinaman is rarely to be seen in the streets. Drunkenness is not a national vice, but, unfortunately, their abstinence does not extend to opium, a drug which seems to have a greater attraction for them than for any other people on the face of the earth. They take to it greedily, and when once the habit of smoking it becomes confirmed, the difficulty of relinquishing it is exceedingly great. There has, no doubt, been much exaggeration in what has been talked and written on this subject. But on the testimony of Chinamen themselves the effects of opium smoking must,

Every-day customs.

Opium smoking.

be regarded as injurious to health and destructive to all the better parts of man's nature. From the time of its introduction into the country, the Chinese Government has opposed the traffic; and on the occasion of the last revision of the Treaty by Sir Rutherford Alcock, Prince Kung and his colleagues made a vigorous stand against the clause which legalizes its importation. In this as in other attempts they were unsuccessful, and it remains to be seen whether the policy they appear now to be adopting of encouraging the growth of native opium will extinguish the import trade.

Since the conclusion of the treaty in 1860 numerous attempts have been made to induce the Chinese Government to permit the introduction of railways and telegraphs into China, but to all such counsel the emperor's advisers have turned a deaf ear. Not that they are ignorant of the advantages to be derived from these weapons of progress, but they consider that these advantages would be dearly bought if the price to be paid is to be the admittance of foreigners into the interior of the country, coupled with the hold on the soil which these would acquire were they allowed to construct lines of railway and telegraphs through the provinces. It is difficult, however, even for so autocratic a Government as that of China, to carry out such a curbing policy, and in one or two instances lately, events have forced an advance beyond the hard and fast line laid down by the Peking mandarins. The first step in this direction was taken during the war in Formosa, when the viceroy of the province of Fuh-keen ordered the construction of a line of telegraph from Pagoda Island to his Yamun at Fuh-chow Foo. His action was disapproved by the Government, and several attempts were made to frustrate the undertak-

ing, but, mainly through the influence of the foreign ministers, who insisted on the fulfilment of the contract with the telegraph company, the line was finished. The introduction of railways is, however, considered to be a more serious matter, and though at several of the arsenals tramways have for some time been employed, no mandarin has, until quite lately, been bold enough to sanction the use of a locomotive. Quite recently the idea was originated of quietly buying up a strip of land between Shanghai and Woo-sung, and of using it for the construction of a railway. The local mandarins and the Peking Government met the projected line with decided opposition; but here again the arguments brought to bear by the resident foreign ministers were sufficiently cogent to induce it to withdraw all actively obstructive measures, and the first railway in China was opened to traffic under the negative approval of the rulers of the soil. Much importance has been attached to this introduction of railways into China, and the crowded trains which daily travel between the two termini are considered to point to the probable speedy extension of railways throughout the country. But the approval given to the Shanghai railway is merely that of the people; and its completion has at present only intensified the determination of the Government to withstand the adoption of the iron road.

CHINCHA ISLANDS, three small islands in the Pacific Ocean, about 12 miles from the coast of Peru, opposite the town of Pisco, and 106 miles distant from Callao, in $13^{\circ} 38' S.$ lat. and $76^{\circ} 28' W.$ long. The largest of the group, known as the North Island or *Isla del Norte* is only four-fifths of a mile in length, and about a third in breadth; and their whole importance is due to their immense deposits of guano. They are of granitic formation, and rise from the sea in precipitous cliffs, worn out into countless caves and hollows, which furnish convenient resting-places for the sea-fowl. Their highest points attain an elevation of 113 feet, which was increased about 90 feet by the guano-bed. The name of the islands, and of the town and valley of Chincha on the mainland, is derived from an ancient Indian race which has left some interesting relics of its sojourn. A stone idol and two water-pots of grotesque construction were discovered under 62 feet of guano; and a number of wooden idols, two regal emblems, and a curious stone slab have also been found. That these must be of very great antiquity is obvious; but the rate of increase in the guano deposits is too much a matter of conjecture to furnish even an approximate date. Mr George Peacock, of the Pacific Steam Navigation Company, calculated the quantity of guano in the islands in 1846 at 18,250,000 tons; and, according to the survey of the Peruvian Government in 1853, they then still contained 12,376,100. The supply is now practically exhausted; and the foreign export which had begun in 1841 was brought to a close in 1872. Between 1853 and 1872, 8,000,000 tons were obtained from the North and Middle Islands. The former was still visited by 35 Peruvian vessels in 1873, and furnished 11,634 tons. Its population in 1874 was only 105 persons, and the other islands were quite deserted; whereas in 1868 the total population amounted to 6000, who consisted partly of Peruvians, partly of Chinese coolies, and partly of Peruvian convicts. In 1853-4 the Chincha Islands were the chief object in the contest known as the Guano War between President Echenique and General Castilla; and in 1864 they were taken possession of by the Spanish rear-admiral Pinzon in order to bring the Peruvian Government to apologize for its treatment of the immigrants from Biscay.

CHINCHOW, or **CHINCHU**, is the name usually given in English charts to an ancient and famous port of China in the province of Fuh-keen, of which the Chinese name is *Chwanchow-foo*, or *Tswanchow-foo* (by French scholars written *Thsiouan-chéou-fou*). It stands in $24^{\circ} 57' N.$ lat. and $118^{\circ} 35' E.$ long. It is described by Martini (in the 17th century) as pleasantly situated on a tongue of land between two branches of the river which forms the harbour, and these so deep that the largest (Chinese) ships could come up to the walls. The city, though now occasionally visited by missionaries and others, is not one of the treaty-ports, and modern information about it is not abundant. But large junks still come close to the city. The walls have a circuit of 7 or 8 miles, but embrace much vacant ground. The chief exports are tea and sugar, tobacco, china-ware, nankeens, &c. There are still to be seen the remains of a fine mosque, founded by the Arab traders who resorted thither. The English Presbyterian Mission has had a chapel in the city since about 1862. Beyond the northern branch of the river (which is several miles from the city) there is a suburb called Loyang, which is approached by the most celebrated bridge in China.

Chwanchow was in the Middle Ages the great port of Western trade with China, and was known to the Arabs and to Europeans as *Zaitān* or *Zayton*, the name under which it appears in Abulfeda's Geography, and in the Mongol history of Rashīduddin, as well as in Ibn Batuta, Marco Polo, and other mediæval travellers (see CHINA, p. 628).

Marco Polo calls it "one of the two greatest commercial havens in the world," Ibn Batuta, "the greatest seaport in the world."

Some argument has of late been alleged against the identity of Zayton with Chwanchow, and in favour of its being rather *Changchow* (a great city 60 miles W.S.W. of Chwanchow), or a port on the river of Changchow near Amoy. It is possible that the name "Port of Zayton" covered a good deal, and may have embraced the great basin called Amoy Harbour, the chief part of which lies within the Foo or department of Chwanchow; but there is hardly room for doubt that the Zayton of Marco Polo and Abulfeda was the Chwanchow of the Chinese.

Ibn Batuta informs us that a rich silk texture made here was called *Zaitāniya*; and there can be little doubt that this is the real origin of our word *Satin*,—*Zettani* in mediæval Italian, *Aceytuni* in Spanish.

With the question already indicated is connected a singular ambiguity. The name *Chinchew* is now applied as we have defined; but the *Chincheo* or *Chinchew* of old English books, and of the Spaniards and Portuguese to this day, is, as Mr G. Phillips has lately pointed out, not Chwanchow but Changchow. The province of Fuh-keen is often called *Chincheo* by the Jesuits of the 16th and 17th centuries. Changchow, and its dependencies seem to have constituted the port of Fuh-keen with which Macao and Manila chiefly communicated at that period, and where the Portuguese had at one time a factory; and hence they seem to have applied the same name to the port and the province, though Changchow has never been the official capital of Fuh-keen. How English mariners and maps came to transfer the name to Chwanchow is obscure. (See *Journal R. Geog. Soc.*, vol. xlv.; Yule's *Marco Polo*, 2d ed., 1875, vol. ii., &c.)

(H. Y.)

CHINCHILLA, a city of Spain, in the province of Mureia, picturesquely situated on an abrupt hill ten miles south-east of Albacete, in the immediate neighbourhood of the junction of the railway lines from Cartagena and Valencia to the capital. It is surrounded by walls rebuilt in 1837 and defended by a citadel; and in the principal church there are reservoirs capable of furnishing the city with water for several months. Earthenware and earthenware, coarse linen, and woollen cloths are manufactured. Population, 3500.

CHINCHILLA (*Chinchilla lanigera*), a small Mammal belonging to the order *Rodentia*, inhabits the eastern slopes of the Andes in Chili, Bolivia, and Peru, where it has a vertical range of from 8000 to 12,000 feet. It is very similar in size to the common squirrel, being about 10 inches long exclusive of the tail, and in the form of its head it resembles a rabbit. It is covered with a dense soft fur three-fourths of an inch long on the back, and upwards of an inch in length on the sides, of a slate-grey colour, darkly mottled on the upper surface, and of a dusky white beneath; its ears are long and broad and thinly covered with hair. It lives in burrows, and these subterranean dwellings undermine some parts of the Chilean Andes to such an extent as to cause considerable inconvenience and even danger to travellers on horseback. Chinchillas live in communities, forming their burrows among loose rocks, and coming out to feed only in the early morning and towards sunset. They feed chiefly on roots and grasses, in search of which they often travel a considerable distance from their homes; and when eating they sit on their haunches, holding their food in their fore paws. The Indians in hunting them employ a weasel (*Galictis vittata*), which is trained to enter the crevices of the rocks, where the chinchillas often lie concealed during the day in order to avoid the sunshine, and drive them out, when they are readily killed. The fur of this rodent was prized by the ancient Peruvians, who made coverlets and other articles with the skin, and at the present day

they are exported in large numbers to Europe—134,000 skins having been imported into London during 1874—where they are made into muffs, tippets, and trimmings for ladies' dresses. That they have not under such circumstances become rare, if not altogether extinct, is doubtless owing to their extraordinary fecundity, the female usually producing five or six young twice a year. They are exceedingly docile in disposition and cleanly in their habits, and are thus well fitted for domestication, and in this state, owing to the value of their furs, might no doubt be profitably reared.

CHINDWARA. See **CHINDWARÁ.**

CHINGLEPUT, the principal town and fortress of a district of the same name, in the presidency of Madras, in British India, on the left bank of the Palar River, 36 miles S.S.W. of Madras in $12^{\circ}41'N.$ lat. and $80^{\circ}2'E.$ long. Chingleput was taken by the French in 1751, and was retaken in 1752 by Clive. During the wars of the British with Hyder Ali, it was one of the few strongholds which withstood his power, and afforded a secure refuge to the natives. In 1780, after the defeat of Colonel Baillie, the army of Sir Hector Munro sought protection under its walls. The town is noted for its manufacture of pottery, and it carries on a trade in rice. Population, 7500.

CHIN-HAE, or **CHING-HAI**, a district town of China, in the province of Che-keang, at the mouth of the Yung-keang River, 12 miles N.E. of Ningpo, in $29^{\circ}58'N.$ lat. and $121^{\circ}45'E.$ long. It lies at the foot of a hill on a tongue of land, and is partly protected from the sea on the N. by a dike about three miles long, composed entirely of large blocks of hewn granite. The walls are 20 feet high and 3 miles in circumference. The defences were formerly of considerable strength, and included a well-built but now dismantled citadel on a precipitous cliff, 250 feet high, at the extremity of the tongue of land on which the town is built. In the neighbourhood an engagement took place between the English and Chinese in 1841.

CHIN-KEANG-FOO, a maritime city of China, in the province of Keang-soo, at the junction of the Grand Canal with the Yang-tze Keang, 48 miles E.N.E. of Nanking. It was formerly a prosperous and important city with a population of about half a million, well defended by brick walls, in many places 35 feet high, and regarded as the key of the empire towards the sea. In 1842 it yielded to the British forces after a desperate resistance. Since then, however, it has not only suffered from the aberrations of the river system of China, but it has also been laid waste by the insurgents in 1853. It was recaptured by the imperial forces in 1858, and has begun to recover its position.

CHINON (in the Middle Ages *Castrum Caino*), a town of France, capital of an arrondissement in the department of Indre-et-Loire, pleasantly situated on the right bank of the Vienne, 28 miles S.W. of Tours. It has a tribunal of primary instance, a communal college, a town house, and some trade in grain, dried fruits, wine, and brandy. Here Henry II. of England died in 1189; and on the rock above the town there are extensive ruins of the castle where Charles VII. of France resided after the occupation of Paris by the English, and first gave audience to Joan of Arc. In the castle-rock there are large quarries known as Les Valains, from which building materials have been obtained for ages. Rabelais was born in 1483 at the farm-house of La Devinière in the vicinity, and his house is shown in the Rue de la Lamproie. Population in 1872, 6553.

CHINSURAH, a town of British India, situated on the western bank of the Hooghly River, 24 miles above Calcutta, and formerly the principal Dutch settlement in Bengal. It was among the cessions on the continent of India made by the king of the Netherlands in 1824 in exchange for the British possessions in the island of

Sumatra. The Dutch erected a factory here in 1656, on a clear and healthy spot of ground, much preferable to that on which Calcutta is situated, and soon attracted a considerable number of natives to settle in the vicinity. About thirty-five years after this they fell under the displeasure of one of the native potentates, who sequestered their property and prohibited their traffic. In 1686 all their factories were re-established, and their trade long continued to flourish. In 1759, a British force under Colonel Forde was attacked by the garrison of Chinsurah on its march to Chandernagore. The action was short but decisive, for in less than half an hour the Dutch were entirely routed. In 1795, when Holland became a province of France, the British offered to retain Chinsurah for the stadtholder, but the governor having declined to surrender, the settlement was reduced by a detachment from the military stations at Barrackpore, and was occupied by a British garrison during the whole war. At the general peace of 1814 it was restored to the Dutch. The town, which extends for half a mile along the banks of the river, is built neatly, and with great solidity, of brick and mortar; and the houses are plastered with fine lime, and have flat roofs and green Venetian windows. It is the seat of an extensive military establishment which has been considerably increased since 1858, and is now capable of accommodating 5000 men. The hospital attached is on a large scale. An important educational institution known as Hooghly College is maintained by Government; and there are a number of schools in the town, several of which are carried on by the missionaries of the Free Church of Scotland. Population, about 14,000.

CHIOGGIA, or **CHIOZZA**, a town of Italy, in an island of the same name in the Gulf of Venice, 15 miles south of the city of that name. It is united to the mainland by a bridge of 43 arches, protected at the further extremity by Fort Malghera or Haynau; and the port is likewise defended by Forts Caraman and San Felice. The cathedral of Longhera, founded in 1633, is its most remarkable building; the church of S. Andrea was of much greater antiquity, but it was restored in 1734. From Chioggia to Malamocco stretches the great sea-wall of the Murazzi, which protects Venice from the inroads of the ocean. Chioggia is the Roman *Fossa Claudia*, and began to bear the name of Clugia in the 4th century. In 809 it was destroyed by Pepin, and in 901 by the Slavonic invaders. In 1100 it was chosen as his see by the bishop of Malamocco. With the exception of the years from 1379 to 1381, when it was held by the Genoese, it continued subject to Venice till the fall of the republic; but in spite of its proximity and political connection, it has maintained to the present day some peculiarities of language and custom. Population, 26,336.

CHIOS. See **SCIO.**

CHIPPENHAM, a parliamentary and municipal borough and market-town of England, in the county of Wiltshire, 30 miles N.N.W. of Salisbury, and 94 miles from London by the Great Western Railway, in a valley on the left bank of the Avon, which is here crossed by a handsome stone bridge of 22 arches. It consists mainly of one well-built street more than half a mile in length, and has a spacious Gothic church of considerable antiquity, a town-hall, a market-house, and a literary institution. Formerly the seat of an extensive broad-cloth manufacture, it is now mainly an agricultural town, with flour-mills and tanneries, and large cattle and cheese markets. The stone quarries in the neighbourhood give employment to three or four hundred workmen. The parliamentary borough, which includes the parishes of Chippenham, Hardenhuish, Langley-Burrell, and Pewsham, and had in 1871 a population of 6875, returns one member to Parliament; up till 1867

CHIUSA, or LA CHIUSA, a town of Italy on the Pesio, in the province of Cuneo, and about ten miles south-east of the city of that name. It has a population of upwards of 6000, chiefly engaged in the manufacture of silk and glass. It is not to be confounded with a hamlet in the province of Turin, which was named Chiusa (enclosure) from its position near the fortified line erected by Desiderius of Lombardy, in 774, to check the advance of Charlemagne.

CHIUSI, a town of Italy, in the Tuscan province of Siena, situated on a hill, and not far from the Lake of Chiusi. It is a bishop's see, and has a large cathedral, but is chiefly interesting for the Etruscan bronzes, mirrors, vases, and funereal urns found in the vicinity, of which its museums contain collections. Chiusi, the *Clusium* of the Romans, was one of the twelve cities of the Etruscan confederation, and was the headquarters of Porsena. After the decay of the Roman power it sank in importance, and in the Middle Ages malaria greatly reduced the number of its inhabitants; of late years, however, the prospects of the place have greatly improved, in consequence of the drainage of the marshes in the neighbourhood. Population, 6460.

CHIVASSO, a city of Italy, in the province of Turin, at a railway junction, 15 miles north-east of the city of Turin. Situated on the left bank of the Po near the influx of the Orco, it was formerly considered the key of Piedmont; but its fortifications were dismantled by the French in 1804, and it is now only enclosed by a single wall with two gates leading to two suburbs. The front of the church of San Pietro, a building of the 15th century, is decorated with ornaments and entire statues in terra cotta, of great elegance, but much defaced. Of the ancient palace of the counts of Montferrat an octagonal tower still remains. The principal trade of the town is in grain and wool; and its lampreys are in repute. On the opposite side of the Po, and a few miles down the stream, are the ruins of the Roman city of *Industria*, which were discovered in 1745. Population, 7800.

CHLAMYDOPHORE (*Chlamydophorus truncatus*), an Edentate Mammal found at Meudoza, on the eastern slope of the Cordilleras, where it is known as the *Pichiciago*, but is so seldom seen as to be regarded with curiosity even by the natives. Its total length is from 5 to 6 inches, and its upper surface is covered with a flexible cuirass somewhat resembling the external armature of the Armadilloes—its nearest allies—but differing from the latter in being attached only by the middle of the back and the top of the head, the frontal bone of the skull being provided with two prominent knobs for this purpose. The dorsal shield, which contains 24 rows of square, cubical, or rhomboidal plates of a leathery texture, makes, at its posterior edge, an abrupt bend downwards, and is continued to the extremity of the tail, thus forming a posterior shield for the protection of the creature's hindquarters while it is burrowing. The sides of the back beneath the shield, the under part of the body, and the limbs are covered with silky hair, of a dirty white colour, longer and finer than that of the mole. An examination of the *Pichiciago* skeleton proves it to be an exceedingly aberrant member of the Armadillo family, having structural affinities with other and widely different mammals. Thus it resembles the beaver in its flattened paddle-like tail, the mole in its short strong legs and powerful claws, the sloth in its teeth, and ruminants in the form of the lower jaw. It also resembles the ornithorhynchus and echidna—the lowest mammalian forms—in points wherein all three show affinity with birds; while in the form of the skull and pelvis it is unique among mammals. According to Dr Buckland it makes the nearest approach of living *Edentata* to the gigantic extinct *Megatherium*. It is a burrowing animal, living like the mole in the subter-

ranean galleries which it scoops out with its sharp, powerful claws, assisted probably by the flattened tail, which is supplied with strong muscles, and thus well adapted for throwing out the earth which gradually accumulates under the creature. Like the mole its ears and eyes are exceedingly small and almost hidden by the long silky hair surrounding them. Another species has recently been discovered in Bolivia somewhat larger than the preceding, and differing from it in having the dorsal shield attached all over to the skin of the back.

CHLORAL, TRICHLORALDEHYDE, or HYDRIDE OF TRICHLORACETYL, C_2Cl_3OH or $CCl_3.CO.H$, a substance discovered by Liebig in 1832, and further studied by Dumas and Städelér. It is a heavy, oily, and colourless liquid, of specific gravity 1.518 at $0^\circ C.$, and boiling point $94^\circ 4 C.$ It has a greasy, somewhat bitter taste, and gives off a vapour at ordinary temperature which has a pungent odour and an irritating effect on the eyes. The word *chloral* is derived from the first syllables of *chlorine* and *alcohol*, the names of the substances employed for its preparation. Chloral is soluble in alcohol and ether, in less than its own weight of water, and in four times its weight of chloroform; it absorbs but is not acted upon by chlorine, and dissolves bromine, iodine, phosphorus, and sulphur. Chloral deliquesces in the air, and, like aldehyde, is converted by water into a hydrate, with evolution of heat; it combines also with ethylic alcohol and its homologues, and the derived mercaptans. An ammoniacal solution of nitrate of silver is reduced by chloral; sulphites of the alkalis form with it crystalline compounds; and nascent hydrogen, by replacing its three atoms of chlorine, converts it into aldehyde (Personne, *Ann. Ch. Pharm.*, clvii. 113). By means of phosphorus pentachloride, chlorine can be substituted for the oxygen of chloral, the body $CCl_3.CCl_2H$ being produced; an analogous compound, $CCl_3.C(C_6H_5)_2H$, containing the radicle phenyl in the place of the oxygen, is obtained by treating chloral with benzene and sulphuric acid. With an alkali, chloral gives chloroform and a formate of the base according to the reaction $CCl_3.CO.H + KHO = CCl_3H + H.CO(OK)$; it is converted by oxidizing agents into trichloroacetic acid $CCl_3.CO(OH)$; and forms with cyanic acid the body $C_5H_3Cl_6NO_3 = (CCl_3.CO.H)_2.COHN$. When kept for some days, as also when placed in contact with sulphuric acid or a very small quantity of water, chloral undergoes spontaneous change into the polymeride *metachloral*, $C_6H_3Cl_3O_3 = (C_2Cl_3OH)_3$, a white porcelainous body, slowly volatile in the air, insoluble in water, alcohol, and ether, and reconverted into chloral without melting at $180^\circ C.$

Chloral is prepared by passing dry chlorine into absolute alcohol; the latter must be cooled at first, but towards the end of the operation has to be heated nearly to boiling. The alcohol becomes converted finally into a syrupy fluid, from which chloral is procured by treatment with sulphuric acid. The action of chlorine upon alcohol is complex;—first aldehyde, $CH_3.CO.H$, is produced, which combines with alcohol to form acetal, $CH_3.CH(OC_2H_5)_2$; this, acted on by chlorine, yields trichloroacetal, $CCl_3.CH(OC_2H_5)_2$, which is converted by the hydrochloric acid present into chloral alcoholate, $CCl_3.CH.OH.OC_2H_5$, and monochloroethane, C_2H_5Cl . The latter body is also formed directly from alcohol, in the process for the manufacture of chloral, and combines with aldehyde, giving monochlorinated ethylic ether, $CH_3.CHCl.OC_2H_5$, which is converted by chlorine into tetrachlorinated ether, $CCl_3.CHCl.OC_2H_5$. By the action of sulphuric acid, chloral alcoholate and tetrachlorinated ether are resolved into alcohol and chloral, and monochlorethane and chloral, respectively. The crude chloral is distilled over lime, and is purified by further treatment with sulphuric acid, and by redistillation.

A mixture of starch or sugar with manganese peroxide and chloroformic acid may be employed instead of alcohol and chloroform for the manufacture of chloral (Städeler, *Ann. Ch. Pharm.*, lxi. 101-121). An isomer of chloral, *parachloralide*, is made by passing excess of dry chlorine into absolute methylic alcohol; it is a colourless liquid, insoluble in water, and boils at 182° C. (Cloëz, *Ann. Ch. Pharm.*, iii. 180).

Chloral hydrate, $C_2Cl_3OH.H_2O$, or $CCl_3.CH(OH)_2$, the compound formed by the union of water with chloral, occurs in the form of oblique, often very short, rhombic prisms; an acicular form of crystals is considered by Paul to be characteristic only of the alcoholate. The purest samples of chloral hydrate present the appearance of ordinary alum broken into fragments, are perfectly transparent, only slightly odorous, free from powder, and dry to the touch, and do not become white by exposure. Jacobsen gives the melting point of pure chloral hydrate as 50° to 51° , the boiling point as 99° C. It can be distilled unchanged at 120° C.; but when heated with sulphuric acid it is converted into anhydrous chloral and *chloralide*, $C_2H_2Cl_6O_2$. When mixed with water, chloral hydrate causes a considerable degree of cold; and, as with camphor, small fragments of it placed on the surface of water exhibit gyratory movements. An aqueous solution should be neutral or nearly so, and should give but a faint milkiness when boiled with silver nitrate. A drop or two of ammonia added to solutions assists in their preservation. Chloral hydrate may be detected in the presence of other substances by adding an alkali and heating, when chloroform is evolved, which may be collected in a receiver; this process can be employed for the estimation of the commercial hydrate. When ammonium sulphide is added to a solution of pure chloral hydrate, the liquid turns red, and then becomes rapidly brown and thick; the presence of oily impurities in a solution is shown by the brown colour it acquires when shaken up with concentrated sulphuric acid. Chloral hydrate has the property of checking the decomposition of a great number of albuminous substances, such as milk and meat; and a mixture of it with glycerine, according to Personne, is suitable for the preservation of anatomical preparations. When heated with concentrated glycerine to a temperature of 110° - 230° C., chloral hydrate yields chloroform, $CHCl_3$, and formate of allyl, $HCO(OC_3H_5)_2$; and by the action of nitric acid and strong sunlight, at 195° C. it is transformed into trichloroacetic acid, $CCl_3.COOH$. The effect of chloral hydrate upon fresh blood, like that of formic acid, is to render it darker.

The breaking up of chloral hydrate, in the presence of alkalis, with the production of chloroform and formates, led Liebreich to the conjecture that a similar decomposition might be produced in the blood; and hence his introduction of the drug, in 1869, as an anæsthetic and hypnotic (*Compt. rend.*, 1869, lxi., 486). It has been supposed that its physiological action may be due to formic acid as well as to chloroform set free in the blood, the effects of the formic acid being attributed to the production from it of carbon dioxide. Personne, however, has administered sodium formate to dogs, without perceiving in them the slightest anæsthetic phenomena, or the abnormal formation of carbon dioxide (*Compt. rend.*, 1874, lxxviii. 129). He considers that chloroform is set free in the blood, but is not eliminated as such, being converted into sodium chloride and formate (*ibid.* 1869, lxi., 983); the prolonged action of chloral on the animal economy he explains on the supposition that chloroform being produced at the expense of the alkali of the albumen of the blood, the latter, which may be regarded as an amide, forms with the trichlorinated aldehyde chloral a compound which, by the gradual action of the blood, affords a continuous supply of chloroform.

Tauret, on the other hand, suggests that as chloral hydrate, when made alkaline with caustic potash, yields in the presence of the oxidizing agent potassium permanganate the formate, chloride, and carbonate of potassium, together with carbon monoxide, the alkalinity of the serum of the blood may determine a similar decomposition of chloral hydrate, the physiological effects of which may therefore be ascribed to poisoning or deoxygenation of arterial blood by carbon monoxide (*Compt. rend.*, lxxix. 662; *Journ. Pharm. Chim.* (4), xx. 355-357).

The first effect of a dose of chloral hydrate is to produce a state of congestion of the brain, as evidenced by the condition of the retinal vessels; after 5 or 10 minutes, contraction of the vessels is observed, the retina becomes of a pale pink colour, and drowsiness ensues; when this wears off, the retinal and cerebral vessels resume their accustomed size (Dr W. A. Hammond). In cases of death from chloral, the cerebral vessels have been found much congested.

The effects of chloral hydrate vary with different individuals; but, as a rule, a dose of 20 grains acts in a healthy subject as a mild sedative of the sensory nervous system, and produces, about half or three quarters of an hour after it has been taken, a light, refreshing, and normal sleep, without causing headache or disturbance of the respiration and pulse.

Taken in large quantities chloral hydrate is a powerful soporific; it perceptibly lowers the temperature of the body, and diminishes the frequency and force of the heart's action, probably from paralysis of its intrinsic motor ganglia; whilst the rate of respiration is lessened, apparently through affection of the medulla oblongata. Excessive doses produce complete insensibility, and diminish, and at last abolish reflex excitability; pallor, coldness of the extremities, lividity, and muscular relaxation ensue; and death may result from cardiac syncope.

M. Oré is the originator of a plan for performing operations during anæsthesia produced by the intra-venous injection of chloral hydrate. He shows (*Compt. rend.*, 1874, lxxviii. 515, 651) that it may be harmlessly injected, and that when thus brought into immediate contact with the blood, it effects complete anæsthesia of long duration, and is a rapid and effectual remedy for tetanus. Chloral hydrate sometimes fails to afford relief from suffering, and when it does not induce sleep, may occasion excitement and delirium. In some cases a dose has produced an eruption of urticaria. It must be administered with caution to children, and to patients having disease of the heart and of the digestive tract, certain affections of the bronchi, or hysteria. It appears that chloral cannot be decomposed and thrown off by a healthy body at a greater rate than from 5 to 7 grains an hour (Richardson, *Lancet*, 1871, i. 209); and as the limit of the dose that can be safely taken is not affected by the customary use of the drug, as in the case of opium, but rather the reverse, its incautious employment in large quantities, and the practice of habitually resorting to it to gain relief from sleeplessness, from neuralgia, and from the effects of alcoholic excess, have in not a few instances led to fatal results. In consequence of this risk medical practitioners now use it less extensively. The continued use of chloral hydrate, too, is apt to cause a hyperæmic condition of the skin, diffuse inflammatory erythema of the face and chest, conjunctivitis, and interference with respiration; and may bring on deep melancholy, weakness of will, and inability to sleep without the drug.

Chloral hydrate is of special value as a soporific where opium is inadmissible, as in the case of children, in uræmia, and in some fevers. It is used in delirium tremens, rabies, severe chorea, acute mania, and phthisis, as well as in dyspnoea, pertussis, cholera, sea-sickness, cancer, chronic rheumatism, and gastralgia, and in parturition and eclampsia;

and in cases of tetanus it is employed to produce muscular relaxation. Its antagonism to strychnia was first pointed out by Liebreich (*Compt. rend.*, 1870, lxx. 403). When administered to rabbits it has been found to be a remedy for poisonous doses of strychnia (Bennett, *Edin. Med. Journ.*, 1870, xvi. 262); but Oré has shown (*Gaz. Médic. de Paris*, 1872, p. 401) that the hypodermic injection of that drug is of no avail in the case of rabbits poisoned with fatal doses of chloral hydrate. Numerous experiments have led to the conclusions that "chloral hydrate is more likely to save life after a fatal dose of strychnia, than strychnia is to save life after a fatal dose of chloral hydrate;" that after a dose of strychnine has produced tetanic convulsions, these convulsions may be reduced in force and frequency, and life may be saved, by means of the influence of chloral hydrate; but that though the effects of a poisonous dose of the hydrate may be mitigated, the coma produced by its action on the brain is not removed by strychnia (Bennett, Report in *Brit. Med. Jour.*, 1875, 1, 97; Ogilvie Will, *Edin. Med. Jour.*, April 1875, 907). Chloral hydrate modifies the action of a fatal dose of extract of Calabar bean, but is of little service if given some time after the latter. The effects of chloralism are combated by provoking emesis, and by stimulating freely.

Among the very numerous contributions to the history of chloral, in addition to the above-given, may be mentioned the following:—Liebig, *Ann. Ch. Pharm.*, i. 189; Dumas, *Traité de Chimie*, t. v. 599; Städeler, *Ann. Ch. Pharm.*, cv. 293, cvi. 253; Bouehut, *Compt. rend.*, lxxix. 966, *Bull. de Thér.*, lxxvii. 433; Sir J. Y. Simpson, *Med. Times*, Jan. 1, 1870; Byasson and Follet, *Journ. de l'Anal. et de Physiol.*, 1870, 570; Hofmann, *Compt. rend.*, 1870, lxx. 906; Personne, *ibid.*, lxxi. 227; Paul, *Pharm. Journ. and Trans.* (3), i. 621; Hausemann, *Schmidt's Jahrb.*, cli. 81; Jacobsen, quoted in *Journ. Chem. Soc.*, ix. 257; Rokitansky, *Stricker's Jahrbücher* (iii. and iv. Heft), 1874. (F. H. B.)

CHLORINE, one of the chemical elements (symbol, Cl), discovered by Scheele in 1774. It was long regarded as a compound; Scheele termed it *dephlogisticated muriatic acid*, and Berthollet about 1785 gave it the name of *oxygenized muriatic acid*, which Kirwan contracted into *oxymuriatic acid*. In 1809 an abstract of a paper was published by Gay-Lussac and Thénard, in the 2d vol. of the *Mémoires d'Arcueil*, in which they demonstrated the possibility of the absence of oxygen from oxymuriatic acid. The attention of Davy being drawn to the subject, he in 1810 communicated to the Royal Society a paper in which he showed that there was no evidence in support of the opinion that oxymuriatic acid contained oxygen; and in a paper published in the following year he comes to the conclusion that oxymuriatic acid is an uncompound substance, and gives to it the name of *chlorine*, on account of the greenish colour it possesses. Chlorine and its combinations with other elements having been already treated of under the heading CHEMISTRY, it will be necessary here only to give some account of the more important commercial chlorine compounds hydrochloric acid, bleaching powder, and potassium chlorate, and of the methods of preparing them.

Hydrochloric Acid (HCl).—Practically, the whole of the hydrochloric acid now employed in the manufacturing arts is obtained as a collateral product in the celebrated soda process of Leblanc. The first stage in that process consists in treating common salt with sulphuric acid in the salt-cake roasting furnace, by which sodium sulphate and hydrochloric acid are formed:— $2\text{NaCl} + \text{H}_2\text{SO}_4 = \text{Na}_2\text{SO}_4 + 2\text{HCl}$.

Till the year 1863 the acid fumes given off in alkali works were allowed to escape freely into the atmosphere, and being dissolved and brought down by every shower, destroyed or seriously damaged vegetation for miles around the works. In that year the Alkali Act was passed, by which manufacturers were obliged to condense not less than 95 per cent. of the total amount of hydrochloric acid

evolved in their establishments; and since that time great attention has been paid to the condensation, so that now in many works practically no acid fumes escape. The hydrochloric acid gas liberated in the roasting furnace is conveyed through a range of stoneware pipes, in connection with which are various devices for cooling it in its passage. It is then conducted into condensing towers—long wide funnels packed with coke—through which a stream of water is made to percolate from the top, an enormous surface of moisture being thus presented to the acid fumes. The solution of the gas in the water constitutes the hydrochloric acid, muriatic acid, or spirit of salt of commerce. So prepared, the acid always contains several impurities, such as arsenious acid, ferric chloride, and sulphurous acid; but these do not interfere with its application to the preparation of bleaching powder, in which it is chiefly consumed. Without any purification it is also employed for "souring" in bleaching, and in tin and lead soldering.

Bleaching Powder, or Chloride of Lime.—The history of the application of chlorine to bleaching purposes before the introduction of the so-called chloride of lime will be found under the article BLEACHING. Bleaching powder is made by exposing pure slaked lime to an atmosphere of chlorine till the lime will absorb no more of the gas. Many plans for the preparation of the chlorine have been proposed, and various important processes adopted, since the manufacture of bleaching-powder was established by Messrs Tennant and Co. The original process was as follows. A mixture of native peroxide of manganese ground to a fine powder, common salt, and sulphuric acid was put into a large, nearly spherical, leaden vessel furnished at the top with an air-tight lid. In this vessel an agitator was placed by which its contents could be from time to time stirred up. From the lid a lead pipe conveyed the liberated chlorine into the chamber in which the lime to be saturated was spread in a thin layer. The exterior of the leaden vessel was cased with an iron covering, space for the circulation of a current of steam between it and the covering being left. Upon the charging of the still chlorine was at first given off without heat; but after some time a current of steam was made to circulate around the still, so as to maintain a sufficient temperature to disengage all the chlorine. The materials used consisted of common salt, manganese peroxide, and sulphuric acid, and the resulting products were manganous sulphate, sodium sulphate, water, and chlorine:—

Through the development of Leblanc's well-known soda process large quantities of hydrochloric acid became available for the manufacture of chlorine, in place, as formerly, of a mixture of common salt and sulphuric acid; and for many years hydrochloric acid alone has been used. Coarsely ground manganese oxide is placed within an oblong stone still, into which the necessary charge of strong hydrochloric acid is admitted. Steam is then allowed to circulate in the outer case of the still till the temperature of the mixture is raised to about 180° Fahr. When this point is reached, steam at a pressure of 20 to 25 lb. is blown through the charge at intervals for about six hours, after which the reaction is complete—the whole occupying about twenty-four hours. The chemical changes that take place are expressed in the following equation:—

Native binocide of manganese being an impure and variable compound has to be used in quantities proportionate to the MnO_2 it contains.

For each molecule of chlorine obtained by the above reaction, it will be observed that one of manganous chloride is formed, a substance that was formerly run off as a waste product. Apart from the nuisance thereby created, the drain on the supply of manganese ore became serious, supplies diminished, and prices rose in proportion. It became therefore an object of much importance to obviate the waste of manganese, and this was sought in two different directions

Efforts in the first place were made to regenerate the manganese waste, so as render it continuously available for manufacturing purposes; and secondly, it was frequently attempted to dispense altogether with the use of manganese in the process.

The first really successful plan for the recovery and re-oxidation of manganese was devised by Mr Charles Dunlop, and was introduced at Messrs Tennant's works, at St Rollox, Glasgow, where it is still (1876) in operation. By Dunlop's process the residual still-liquor is first treated with carbonate of lime to neutralize its free acid and decompose the contained ferric chloride, which thus gives a precipitate, ferric oxide. The clear liquor obtained is a second time mixed with carbonate of lime, then introduced into an enormous iron boiler, in which it boils at a pressure of four atmospheres for about twelve hours. Under the influence of the heat applied the manganese exchanges its chlorine for the carbonic acid of the carbonate of lime, and a hydrated manganese carbonate, suspended in a solution of chloride of calcium, is produced, thus:—

The manganese carbonate is subsequently allowed to subside, and the solution of chloride of calcium is washed out. The manganese carbonate is drained till it becomes a white putty-like mass, when it is put into shallow iron trays, and roasted in a furnace at a heat gradually increasing to 550° or 600° Fahr. Under the influence of the heat the carbonic acid is driven off, and by degrees, from being a white powder, the manganese compound darkens till on the completion of the process it is a soot-like mass. Owing principally to the expensive nature of the plant necessary, the Dunlop process never extended beyond St Rollox; but it has satisfactorily maintained its position in that gigantic establishment.

The method of artificially oxidizing manganese which is now almost universally adopted, and has during the past few years quite revolutionized the bleaching powder manufacture, is that invented by Mr Walter Weldon. Manganous chloride by treatment with lime becomes changed into the lower oxide of manganese (MnO), a body which with great difficulty is raised to the higher sesquioxide (Mn_2O_3), beyond which stage of oxidation no exposure to oxygen raises it. But when treated with excess of lime the manganous oxide rapidly unites with oxygen, and becomes transformed into the peroxide (MnO_2), which is the chemical compound available for the preparation of chlorine. It was this fact which Mr Weldon discovered, and has turned to advantage in his process. The phenomenon he accounts for on the assumption that the sesquioxide (Mn_2O_3) formed by the exposure of manganous oxide (MnO) to oxygen is really a manganous manganite, or a combination of MnO with MnO_2 , the former having basic, the latter acid functions. The lime added by Mr Weldon supplies a more powerful base, and enables the whole of the manganese to attain to the condition of peroxide, uniting as it does in such a manner with the lime as to form a calcium manganite (CaMnO_3). By employing a diminished quantity of lime along with an increased current of air, it has been found possible to effect the complete oxidation of the manganese, an acid manganite (CaMnO_3 , H_2MnO_3) being probably formed.

In his treatment of the still-liquors Mr Weldon first neutralizes the acid, &c., as is done in Mr Dunlop's process. The clear rose-tinted liquor thereby obtained is passed into a vessel called the oxidizer, at a temperature of about 140° Fahr. A pipe for conveying a current of air passes down the centre of the vessel, terminating near the bottom in a series of distributing pipes, and connected at the other end with a blowing engine. The liquor being at, or brought by injected steam to the proper temperature, then, according to Mr Weldon (*Soc. of Arts Lecture*, May 1874), the injection of air is commenced, and there is rapidly added, in the state of very fine division, 1·6 times the quantity of lime equivalent to the manganese in the liquor. This converts the charge into a thin white mud, which consists of solution of calcic chloride holding in suspension manganous oxide, or MnO , and also holding partly in suspension partly in solution six-tenths of an equivalent—reckoned on the manganese present—of free lime. When a little of this white mud is thrown on to a filter, the clear filtrate is naturally found, owing to the quantity of free lime present, and to the powerfully solvent action upon lime of hot solution of calcic chloride, to possess a strongly alkaline reaction. As the injection of air goes on, the mud becomes gradually darker in colour, owing to the white hydrated MnO becoming converted into black MnO_2 by absorption of oxygen from the injected air, what was originally a thin white mud being at length converted into a thin black mud. During the progress of this conversion of the originally white mud into a black mud, it is found that the alkaline reaction of the filtrate from the mud gradually diminishes in intensity, until at length it entirely disappears; and it is found, too, that when this alkaline reaction ceases, the absorption of oxygen from the injected air ceases also. When this stage is reached, which is at the end of two, three, four, or five hours, according to the relation between the size of the oxidizer and the size of the blowing-engine employed, a little more liquor is run into the oxidizer from the settlers above, the injection of air is continued for a few minutes longer, and the charge is then run off from

the oxidizer into one or other of a range of settlers placed below it. In these it separates, in the course of a few hours, into rather more than half perfectly clear solution of calcic chloride, and a little less than half black mud of rather more than twice the density of that which left the oxidizer. The solution of calcic chloride is now decanted, and the settled mud is then ready for use for the liberation of chlorine from hydrochloric acid.

The now practically universal use of regenerated manganese oxide in a state of fine division has considerably modified the older operations for the manufacture of chlorine. Hydrochloric acid, according to the plan at present in use, is first run into the still, and the manganese mud is admitted gradually to it in a carefully regulated stream. Instead of the old oblong trough-like still, one much more capacious, of pentagonal form, is generally employed. The details of working vary in almost every establishment, but the following may be taken as an example of ordinary practice. A charge of hydrochloric acid, equal to the amount yielded by about 65 cwt. of common salt, is led into the still, and to it is added from 14 to 15 cwt. of 70 per cent. manganese. Finely slaked lime to the amount of 40 cwt. is spread in a uniform layer on the floor of the chamber, and from these quantities 70 or 71 cwt. of bleaching powder containing from 35 to 37 per cent. of available chlorine is obtained. The lime, after receiving a first charge of gas, is left 24 hours, when it is turned by workmen. Another charge is then admitted, and on the expiry of twenty-four hours more the bleaching powder is ready to be drawn off and packed in barrels.

Of the many chlorine processes without manganese which have been proposed, the only plan which has stood the test of wide practical application is that introduced in recent years by Mr Henry Deacon, of Widnes, in Lancashire. Doubtless his is a process which would have been widely introduced but for the economy and satisfactory nature of Mr Weldon's method. A process for liberating chlorine from hydrochloric acid gas by exposing it with atmospheric air to a high temperature was patented by Mr Robert Oxland in 1845. Mr Deacon discovered that in this process, when the air and gas are brought into contact with sulphate of copper the hydrochloric acid is decomposed much more completely and at a far lower temperature than without that salt. In practice hot hydrochloric acid gas and

over pieces of brick which have been dipped of copper and sulphate of soda, and dried. Chlorine and water are produced by the decomposition, and some traces of hydrochloric acid also pass undecomposed. The water and acid are condensed, and the chlorine mixed with the residual nitrogen of the air passes on to the absorbing chambers. As the chlorine is greatly diluted by the nitrogen, the lime has to be exposed in thin layers over a large area, and Mr Deacon so arranges his chambers that the mixed gases as they enter meet almost completely saturated lime, but as the chlorine becomes absorbed, less highly chlorinized lime is met, till at the end it is almost fresh hydrate of lime over which they pass. Mr Deacon obtains from the acid of 1500 cwt. of salt, with the expenditure of 50 tons of small coal, upwards of 50 tons of 35 per cent. bleaching powder. The process is in operation in his own manufactory at Widnes, and in some Continental establishments Mr Deacon's plant was introduced, but it has been practically abandoned.

Bleaching powder when fresh is a dry, white lime-like powder emitting a strong odour of hypochlorous acid. Commercial samples vary considerably in strength, but when newly made and of good quality they should contain from 35 to 37 per cent. of available chlorine. On exposure bleaching powder parts with its chlorine with considerable rapidity, losing, according to some experimenters, at the rate of 0·63 per cent. per month. On the composition of bleaching powder see CHEMISTRY, page 494.

Potassium Chlorate or Chlorate of Potash.—The preparation of potassium chlorate is an example of the employment of chlorine on an extensive scale, its function, according to the ordinary process of manufacture, being to transform potassium chloride (KCl) into potassium chlorate (KClO_3) by supplying the necessary oxygen from lime. It is obtained by passing excess of chlorine into solution of potassium chloride and milk of lime, according to the equation

The operation is conducted in close leaden vessels, fitted with agitators and heated with steam. On the completion of the above reaction the liquid is filtered and evaporated to near dryness, and the residue is again dissolved in hot water. The two salts—calcium chloride and potassium chlorate—are then easily separated by crystallization; the former, being exceedingly soluble, remains in solution, while the latter deposits in tabular crystals, which may be purified by a slight washing. The salt is very largely used in the manufacture of lucifer matches and various detonating compounds, and in pyrotechny. It is also employed in calico printing as an oxidizing agent in the fixing of certain colours, and it is a convenient source of pure oxygen in laboratory work.

CHLOROFORM, TRICHLOROMETHANE, TERCHLORIDE OF FORMYL, or DICHLORINATED METHYLIC CHLORIDE,

CHOLERA (from *χολή*, bile, and *ῥέω*, to flow). Two distinct forms of disease are included under this general term, namely, Simple Cholera and Malignant Cholera. Although essentially different both as to their causation and their pathological relationships, these two diseases may in individual cases present many symptoms of mutual resemblance.

SIMPLE CHOLERA (synonyms, *Cholera Europæa*, *British Cholera*, *Summer or Autumnal Cholera*) is the cholera of ancient medical writers, as is apparent from the accurate description of the disease given by Hippocrates, Celsus, and Arataeus. Its occurrence in an epidemic form was noticed by various physicians in the 16th century, and an admirable account of the disease was subsequently given by Sydenham in describing an epidemic of cholera in London in 1669-72.

The chief symptoms in well-marked cases are vomiting and purging occurring either together or alternately. The seizure is usually sudden and violent. The contents of the stomach are first ejected, and this is followed by severe retching and vomiting of thin fluid of bilious appearance and bitter taste. The diarrhoea which accompanies or succeeds the vomiting, and is likewise of bilious character, is attended with severe griping abdominal pain, while cramps affecting the legs or arms greatly intensify the suffering. The effect upon the system is rapid and alarming, a few hours of such an attack sufficing to reduce the strongest person to a state of extreme prostration. The surface of the body becomes cold, the pulse weak, the voice husky, and the whole symptoms may resemble in a striking manner those of malignant cholera, to be subsequently described. In unfavourable cases, particularly where the disorder is epidemic, death may result within forty-eight hours. Generally, however the attack is arrested and recovery soon follows, although there may remain for a considerable time a degree of irritability of the alimentary canal, rendering necessary the utmost care in regard to diet.

Attacks of this kind are of frequent occurrence in summer and autumn in almost all countries. They appear specially liable to occur when cold and damp alternate with heat. Occasionally the disorder prevails so extensively as to constitute an epidemic. The exciting causes of an attack are in many cases errors in diet, particularly the use of unripe fruit and new vegetables, and the excessive drinking of cold liquids during perspiration. Outbreaks of this disorder in a household or community can sometimes be traced to the use of impure water, or to noxious emanations from the sewers.

In the treatment, vomiting should be encouraged so long as it shows the presence of undigested food, after which opiates ought to be administered. Small opium pills, or Dover's powder, or the aromatic powder of chalk with opium, are likely to be retained in the stomach, and will generally succeed in allaying the pain and diarrhoea, while ice and effervescing drinks serve to quench the thirst and subdue the sickness. In aggravated cases where medicines are rejected, enemata of starch and landanum, or the hypodermic injection of morphia ought to be resorted to. Counterirritation by mustard or turpentine over the abdomen is always of use, as is also friction with the hands where cramps are present. When sinking threatens, brandy and ammonia will be called for. During convalescence the food should be in the form of milk and farinaceous diet, or light soups and all indigestible articles must be carefully avoided.

In the treatment of this disease as it affects young children (*Cholera Infantum*), most reliance is to be placed on the administration of chalk and the use of starch enemata. In their case opium in any form cannot be safely employed.

MALIGNANT CHOLERA (synonyms, *Asiatic Cholera*, *Indian Cholera*, *Epidemic Cholera*, *Algide Cholera*) is probably the most severe and fatal of all diseases. This form of cholera belongs originally to Asia, more particularly to India, where, as well as in the Indian Archipelago, epidemics are known to have occurred at various times for several centuries. It was not, however, till 1817 that the attention of European physicians was specially directed to the disease by the outbreak of a violent epidemic of cholera at Jessore in Bengal. This was followed by its rapid spread over a large portion of British India, where it caused immense destruction of life both among natives and Europeans. During the next three years cholera continued to rage all over India, as well as in Ceylon and others of the Indian islands. The disease now began to spread over a wider extent than hitherto, invading China on the east, and Persia on the west. In 1823 it had extended into Asia Minor and Russia in Asia, and it continued to advance steadily though slowly westwards, while at the same time fresh epidemics were appearing at intervals in India. From this period up till 1830 no great extension of cholera took place, but in the latter year it reappeared in Persia and along the shores of the Caspian Sea, and thence entered Russia in Europe. Despite the strictest sanitary precautions, the disease spread rapidly through that whole empire, causing great mortality and exciting consternation everywhere. It ravaged the northern and central parts of Europe, and spread onwards to England, appearing in Sunderland in October 1831, and in London in January 1832, during which year it continued to prevail in most of the cities and large towns of Great Britain and Ireland, and its disastrous effects are still in the recollection of many persons. The disease subsequently extended into France, Spain, and Italy, and crossing the Atlantic spread through North and Central America. It had previously prevailed in Arabia, Turkey, Egypt, and the Nile district, and in 1835 it was general throughout North Africa. Up till 1837 cholera continued to break out in various parts of the Continent of Europe, after which this epidemic disappeared, having thus within twenty years visited a large portion of the world.

About the year 1841 another great epidemic of cholera appeared in India and China, and soon began to extend in the direction traversed by the former, but involving a still wider area. It entered Europe again in 1847, and spread through Russia and Germany on to England, and thence to France, whence it passed to America, and subsequently appeared in the West Indies. This epidemic appears to have been even more deadly than the former, especially as regards Great Britain and France. A third great outbreak of cholera took place in the East in 1850, entering Europe in 1853. During the two succeeding years it prevailed extensively throughout the Continent, and fell with severity on the armies engaged in the Crimean War. Although widely prevalent in Great Britain and Ireland it was less destructive than former epidemics. It was specially severe throughout both North and South America. A fourth epidemic visited Europe again in 1865-66, but was on the whole less extensive and destructive than its predecessors. Cholera has since appeared in the form of limited epidemics in various districts of Russia, Turkey, and Western Asia, while it still continues to maintain its footing in India, where sudden outbreaks are of frequent occurrence, being often connected with the assembling of crowds at native festivals.

A disease so widespread in its distribution and deadly in its effects has naturally engaged the attention of scientific physicians in all countries. Investigations into the nature of cholera and the conditions favouring its propagation have been extensively carried on in England, in Germany,

and in India, not merely by those whose opportunities of observing and treating the disease have been numerous, but by others specially undertaking such inquiries at the suggestion of Governments or other public authorities. Although many conflicting views have been propounded on the above-named points, the result of these investigations has been the collection of an amount of information sufficient to form the basis of a rational theory of cholera, and which may be expected yet to lead to the discovery of means to counteract the spread of this pestilence.

The following points respecting the nature and mode of propagation of cholera are generally admitted by the best authorities :—

1. That cholera is a specific disease depending upon the action in the human system of a morbid material (whether of the nature of a parasitic germ or a poisonous miasm being still undetermined) which is originally generated in certain parts of India, particularly in the delta of the Ganges and the flat lands around Madras and Bombay ;

2. That this infective material is capable of spreading from its centre of origin indefinitely, and thus cholera has appeared in an epidemic form in almost all countries ; and further that the disease may become acclimatized (endemic) in some places ;

3. That when it spreads abroad the vehicle of its transmission is the discharges from the bowels of persons already affected ; and that from these the cholera-infecting matter is exceedingly apt to be diffused through the air, to contaminate water, and to become attached to clothing, bedding, furniture, &c., and in these various ways to find ready entrance through the lungs or alimentary canal into the bodies of healthy persons, where it is capable of developing the disease in a more or less severe form according to the quantity introduced ;

4. That cholera is thus in a certain sense contagious ;

5. That overcrowding and other insanitary conditions, particularly the presence of decomposing organic matter, afford the conditions favourable to the multiplication of the cholera matter, and thus tend to spread the disease, although of themselves incapable of originating it.

But even admitting these propositions, it is obvious that they are insufficient to explain the intense tendency of cholera to spread widely at some times more than others. Without alluding to the various hypotheses which have been advanced on this point, it seems probable, from the history of the disease as exhibited both in Europe and in India, that various factors may alone or together be concerned in the rise and spread of epidemics of cholera. It is stated that a high temperature favours the development of cholera, and in general this appears to be the case, but it is by no means invariable, as some of the most severe epidemics raged with greatest fury in winter. That cholera might be carried by the agency of winds from one country to another must be held as a possibility, although no satisfactory evidence exists upon the point. More probable are the theories which assign to local conditions an important part in the propagation of cholera. With regard to mere locality it appears that the disease has been generally found to prevail more extensively and with greater virulence in low-lying districts than in elevated situations. In connection with this, the relation of the character of the soil to the propagation of cholera has been elaborately investigated by Professor Pettenkofer of Munich, whose work in this department has attained world-wide reputation, and who ascribes a powerful influence in the diffusion of the disease to the ground-water of a locality where cholera is prevailing,—shallow, porous soils affording, according to his views, special facilities for the reception, proliferation, and distribution of the so-called cholera germs. Further, the observations of Dr Snow, Dr Frankland, and Mr Simon

in certain epidemics of cholera in London have conclusively connected outbreaks of the disease in various districts with the use of drinking-water contaminated with the discharges from cholera patients. All investigations appear clearly to show that the prime factor, and that without which no other conditions can take effect, is the introduction into the locality of the specific infecting matter, this being accomplished in general by the arrival of infected persons, for cholera epidemics, as is well known, spread mostly in the lines of human intercourse and travel. But further, in this as in other acute infectious diseases, a special liability of individuals must be admitted, as is proved by the fact that among persons living under precisely the same conditions some will suffer while others escape, and likewise that persons inhabiting cholera districts may come to enjoy an immunity from attacks of the disease. Among known predisposing causes, the incautious employment of purgative medicines, the use of unripe fruit, bad and insufficient food, intemperance, personal uncleanness, overcrowding, and all kinds of unfavourable hygienic surroundings play an important part during the course of any epidemic of cholera.

In describing the symptoms of cholera it is customary to divide them into three stages, but it must be noted that these do not always present themselves in so distinct a form as to be capable of separate recognition. The first or premonitory stage consists in the occurrence of diarrhoea. Frequently of mild and painless character, and coming on after some error in diet, this symptom is apt to be disregarded. The discharges from the bowels are similar to those of ordinary summer cholera, which the attack closely resembles. There is, however, at first the absence of vomiting. This diarrhoea generally lasts for two or three days, and then if it does not gradually subside either may pass into the more severe phenomena characteristic of the second stage of cholera, or on the other hand may itself prove fatal.

The second stage of cholera is termed the stage of collapse or the algid or asphyxial stage. As above mentioned, this is often preceded by the premonitory diarrhoea, but not unfrequently the phenomena attendant upon this stage are the first to manifest themselves. They come on often suddenly in the night with diarrhoea of the most violent character, the matters discharged being of whey-like appearance, and commonly termed the "rice-water" evacuations. They contain large quantities of disintegrated epithelium from the mucous membrane of the intestines. The discharge, which is at first unattended with pain, is soon succeeded by copious vomiting of matters similar to those passed from the bowels, unaccompanied with severe pain at the pit of the stomach, and with intense thirst. The symptoms now advance with rapidity. Cramps of the legs, feet, and muscles of the abdomen come on and occasion great agony, while the signs of collapse make their appearance. The surface of the body becomes cold and assumes a blue or purple hue, the skin is dry, sodden, and wrinkled, indicating the intense draining away of the fluids of the body, the features are pinched and the eyes deeply sunken, the pulse at the wrist is imperceptible, and the voice is reduced to a hoarse whisper (the vox cholericæ). There is complete suppression of the urine.

In this condition death often takes place in less than one day, but in epidemics cases are frequently observed where the collapse is so sudden and complete as to prove fatal in one or two hours even without any great amount of previous purging or vomiting. In most instances the mental faculties are comparatively unaffected, although in the later stages there is in general more or less apathy.

Reaction, however, may take place, and this constitutes the third stage of cholera. It consists in the arrest of the alarming symptoms characterizing the second stage, and the gradual but evident improvement in the patient's con-

dition. The pulse returns, the surface assumes a natural hue, and the bodily heat is restored. Before long the vomiting ceases, and although diarrhœa may continue for a time, it is not of a very severe character and soon subsides as do also the cramps. The urine may remain suppressed for some time, and on returning is often found to be albuminous. Even in this stage, however, the danger is not past, for relapses sometimes occur which speedily prove fatal, while again the reaction may be of imperfect character, and there may succeed an exhausting fever (the so-called typhoid stage of cholera) which may greatly retard recovery, and under which the patient may sink at a period even as late as two or three weeks from the commencement of the illness.

Many other complications are apt to arise during the progress of convalescence from cholera, such as diphtheritic and local inflammatory affections, all of which are attended with grave danger.

When the attack of cholera is of milder character in all its stages than that above described, it has been named *Cholérine*, but the term is an arbitrary one and the disease is essentially cholera.

The bodies of persons dying of cholera are found to remain long warm, and the temperature may even rise after death. Peculiar muscular contractions have been observed to take place after death, so that the position of the limbs may become altered. The soft textures of the body are found to be dry and hard, and the muscles of a dark brown appearance. The blood is of dark colour and tarry consistence. The upper portion of the small intestines is generally found distended with the rice-water discharges, the mucous membrane is swollen, and there is a remarkable loss of its natural epithelium. The kidneys are usually in a state of acute congestion.

With respect to the mortality from cholera no very accurate estimate can be formed, since during the prevalence of the disease the milder cases are apt to escape notice, and it is certain that some epidemics are of a more virulent character than others. It is generally reckoned, however, that about one-half the cases of fully developed cholera prove fatal, death taking place in a large proportion of instances in from twenty-four to forty-eight hours. It has been noticed that in cholera epidemics the mortality is relatively greater at the commencement of the outbreak. The disease appears to be most fatal in children and aged persons.

As illustrating the destructive effects of cholera, it may be mentioned that in the first epidemic in England and Wales 52,547 deaths were reported to the Board of Health, but this number was doubtless below the actual amount. In the second epidemic (1848-9) there were 55,181 deaths from cholera in England alone, besides 28,900 from diarrhœa. The subsequent epidemics in this country have been much less fatal.

The treatment of cholera embraces those sanitary measures requisite to be adopted with the view of preventing as far as possible the introduction of the disease into localities previously unaffected, or of checking its spread when introduced, as well as the special medical management of those who have been attacked. These topics can be alluded to only in general terms.

When cholera threatens to invade any place, however favourably circumstanced as to its hygienic condition, increased vigilance will be requisite on the part of those entrusted with the care of the public health. Where the disease is likely to be imported by ships, quarantine regulations will be necessary, and, where practicable, measures of isolation should be adopted in the case of individuals or companies of people coming from infected localities, more especially if they have, or have recently had, any symptoms of cholera in their own persons. It is certain that cholera

may be introduced into a community by one or more individuals who have themselves only suffered from the first or milder stage of the disease (cholera diarrhœa), since the discharges from the bowels abound in the infective matter, and where sanitary arrangements are deficient may readily contaminate the water or air of a locality.

The utmost care will be demanded, particularly in populous districts, in cleansing and disinfecting places where accumulations of animal refuse are apt to occur. The condition of the drinking water and of the wells in which it is collected will always require inspection, as will also the quality of the food supplied, more especially to the poor. Where suspicion attaches to the water, it should be boiled before being used, and the same holds true of the milk. The establishment of cholera hospitals, with a thoroughly equipped staff of medical attendants and nurses, is one of the first and most important steps to be taken in any threatened epidemic, as affording opportunity for the removal and isolation of those attacked at an early period, while every facility should be given to the poorer classes of obtaining medical aid. Instructions should be issued by the authorities warning all persons against the use of unwholesome food, unripe fruit, and excesses of every kind, and recommending early application for medical advice where there is any tendency to diarrhœa. House to house visitation by members of a sanitary staff will be of great service, not merely in discovering cases of the disease, but in the important work of disinfection, which should not be left entirely to the inhabitants, but be done systematically by the authorities. The discharges from cholera patients should be disinfected with such substances as carbolic acid or sulphate of iron before removal, and special care be taken that they are not disposed of in places where they may contaminate drinking water. Every article of clothing which has been in contact with a cholera patient should if possible be burnt, while infected apartments should be thoroughly disinfected with carbolic acid or by fumigation with sulphur. The early burial of those dying from cholera is obviously a matter of urgent necessity.

The influence of fear in predisposing to attacks of cholera has been greatly exaggerated and is now generally discredited. But apart from such considerations there can be no doubt of the wisdom of those to whom it is practicable in removing from a place where cholera is raging.

With respect to the treatment of cholera, it may be safely affirmed, that as to no disease has so much difference of opinion prevailed or so many extravagant notions been entertained regarding the value of remedies. There is a want of agreement as to fundamental principles of treatment; for while astringents have been regarded by some as their sheet anchor, others have condemned them as worse than useless, and rely on the elimination of the *materies morbi* by means of laxatives. Much evil has been done by the manner in which various systems of treatment have been extolled by over-sanguine practitioners as possessing special curative value. Indeed to enumerate the different medicines which have been suggested and employed for the treatment of this disease would be a work of no little difficulty. It is sufficient to state that no medicinal agent has yet been found to be of infallible efficacy in the treatment of cholera. Nevertheless, much may be done, and many lives saved, by the timely application of certain well-approved remedies. The various stages of the disease demand special treatment. In the earlier period of the attack for the cholera-diarrhœa the use of opium is of undoubted value. Given alone in small and oft-repeated doses, or in combination with other astringents, such as catechu, tannin, bismuth, nitrate of silver, or acetate of lead, it frequently succeeds in quelling this symptom, and thus arresting the disease at the outset.

Strict confinement to bed and the administration of bland drinks such as milk, barley-water, and beef-ten, along with counter-irritation to the abdomen, will be found valuable adjuncts to treatment. In the second stage of cholera opium is of less value, and other remedies are called for. The violent vomiting and purging and the intense thirst may be relieved by iced effervescing drinks, while at the same time endeavours should be made to maintain the heat of the body by friction with stimulating liniments or mustard to the surface, and by enveloping the body in flannel and surrounding it with hot bottles. For the relief of the cramps the inhalation of chloroform is recommended, and probably chloral would be found of equal value. Stimulants such as ammonia and brandy must be had recourse to where these measures fail to establish reaction and the patient threatens to sink. When reaction occurs and the vomiting ceases, liquid food in small quantities should be cautiously administered.

CHIOLET, a town of France, in the south of the department of Maine-et-Loire, on the right bank of the Moine. It gives its name to an arrondissement, created in 1857. It has a council of prud'hommes, and a tribunal of commerce; its cattle market is good, and the manufacture of cotton-yarn, calico, cambrie, woollen stuffs, and leather is considerable. The town owes the rise of its prosperity to the settlement of weavers there by Colbert. It suffered greatly in the Vendean war in 1793, inasmuch that for years afterwards it was almost without inhabitants. Population (1872), 11,550.

CHOLULA, an ancient town of Mexico, situated on the plateau of La Puebla between Vera Cruz and the city of Mexico. Although formerly a populous place, it now contains little over 6000 inhabitants, mostly Indians, who are engaged in agricultural pursuits. At the time of the Spanish conquest Cholula—then known as Chololan—was a town of great importance, consecrated to the worship of the god Quetzalcoatl, who had here one of the noblest temples in the country, built on the summit of a truncated pyramid. This pyramid, which is 160 feet high, is now the most conspicuous feature in the place, and is surrounded by a chapel dedicated to Our Lady de los Remedios. The town was visited by Cortez in 1519 in his march to Tenochtitlan, the city of Montezuma, and on that occasion was given over to massacre and pillage, owing to a suspicion against the good faith of the inhabitants.

CHIONS, an Egyptian deity called also Khous or Khouson, principally worshipped at Thebes as the great eldest son of Amen Ra and Mut, and identified with *Aah* the moon. He had two names in the Thebaid, his second being Neferhotep; as such he is called the god of two names. By the Greeks he was called Chon, and considered to be a form of Hercules. Like Horus he is represented as a youthful god, his form mummied, wearing the lock of hair at the right side of his head and a skullcap surmounted by the full and dichotomized lunar disk, or else hawk-

headed, wearing the same. He holds a crook and whip. He was a celestial deity, and at a later time connected with Thoth, and was said to have proceeded from Nu or Haa the celestial waters, or to be the same as Har or Horus and Sln or Sos. The functions of Chous are exceedingly limited; he is said in the Ritual to overthrow the pond, and to be mystically connected with the Phoenix. But the most remarkable characters of Chous are those mentioned on a tablet found on a temple in the S.W. quarter of Karnak dedicated to the god, which had been repaired or erected by Rameses III. of the 20th dynasty, said to be of sandstone and basalt, the doors plated with gold and electrum. The temple of calcareous stone in the Karnak quarter was dedicated to Chous in two characters, that of giving oracles and of expelling evil, and the remarkable tablet found there records the departure of the god in his ark in the 16th year of the reign of Rameses XII. to the land of Bakhtan to expel a demon which had possessed the daughter of the king of that country and sister of the queen of Egypt. After effecting this miracle, and remaining some time there, the god returned in his ark conducted by priests in the 33d year of the same reign. Attached to this temple were cynocephali, a species of ape supposed to represent the moon and the living avatar or sacred animal of the lunar gods, under the charge of a priest or prophet. The worship of Chous appears to have been very common at the Ptolemaic period, and figures of the god in bronze and porcelain are not uncommon in collections. He is an inferior deity of the Pantheon, and although in type allied with Ptah, Osiris, and Horus, exercises none of the attributes of these deities, his chief function being that of the lunar gods; he represents the youngest as Ammon did the oldest of the divine circle.

CHOPIN, FREDERIC-FRANÇOIS (1810-1849), a celebrated composer and pianist, was born at Zelazowa-Wola, near Warsaw, on February 8, 1810. His family was of French origin, but in spite of this he has become the greatest and the most national exponent of Slavonic or more especially Polish nationality in music. In looking through the list of his compositions, teeming with mazurkas, walses, polonaises, and other forms of national dance music, one could hardly suppose that here one of the most melancholy natures has revealed itself. This seeming paradox is solved by the type of Chopin's nationality, a nationality of which it has justly been said that its very dances are sadness intensified. But notwithstanding this strongly pronounced national type of his compositions, his music is always expressive of his individual feelings and sufferings to a degree rarely met with in the annals of the art. He is indeed the lyrical composer *par excellence* of the modern school, and the intensity of his expression finds its equal in literature only in the songs of Heinrich Heine, to whom Chopin has been justly compared. A sensation of such high-strung passion cannot be prolonged. Hence we see that the shorter forms of music, the *étude*, the nocturno, besides the national dances already alluded to, are chosen by Chopin in preference. Even where he treats the larger forms of the concerto or the sonata, this concentrated not to say pointed character of Chopin's style becomes obvious. The more extended dimensions seem to encumber the freedom of his movements. The concerto for piano-forte with accompaniment of the orchestra in E may be instanced. Here the adagio takes the form of a romance, and in the final rondo the rhythm of a Polish dance becomes recognizable while the instrumentation throughout is meagre and wanting in colour. Chopin is out of his element, and even the beauty of his melodies and harmonies cannot

wholly banish the impression of incongruity. Fortunately he himself knew the limits of his power, and with very few exceptions his works belong to that class of minor compositions of which he was an unrivalled master. Barring a collection of Polish songs, two concertos, and a very small number of concerted pieces of chamber music, almost all his works are written for the pianoforte solo; the symphony, the oratorio, the opera he never attempted.

The onter life of Chopin was exceedingly simple and almost totally wanting in incident of any kind. His first musical education he received from a Polish musician of the name of Ziwna, who is said to have been a passionate admirer of J. S. Bach. He also received a good general education at one of the first colleges of Warsaw, where he was supported by the liberality of Prince Antoine Radziwill, a generous protector of artistic talent and himself well known as the composer of music to Goethe's *Faust* and other works. His musical genius opened to Chopin the best circles of Polish society, a society at that time unrivalled in Europe for its ease of intercourse, the beauty and grace of its women, and its liberal appreciation of artistic gifts. These early impressions of refined life were of lasting influence on Chopin's development both as a man and as an artist. He never was and never wished to be a popular composer; his works are full of the subtlest touches of sentiment, they breathe indeed the perfume of the *salon*, and it is the sign of highest power in Chopin that his artistic nature could live in, and even derive new vitality from this dangerous atmosphere. While at college he received thorough instruction in the theory of his art from Joseph Elsner, a learned musician and director of the conservatoire at Warsaw. When in 1829 he left his native town for Vienna, where his *début* as a pianist took place, he was in all respects a perfectly formed and developed artist. This feature again is characteristic of Chopin's work. There is in his compositions little of that gradual progress which, for instance, in Beethoven necessitates a classification of his works according to different periods. Chopin's individuality and his style were distinctly pronounced in that first *Don Giovanni Fantasia* which excited the wondering enthusiasm of Robert Schumann. The same mine of sentiment he worked ever after, but it was one of unbounded wealth. His first appearance in public seems to have been marked by considerable success. A correspondent of the *Allgemeine Musikalische Zeitung*, at that time the first organ of music in Germany, writing from Vienna, November 1829, says that "M. Chopin has placed himself in the first rank of pianists," and goes on to speak in enthusiastic terms of "his delicacy of touch, his rare mechanical dexterity, the melancholy tints of his *nuances*, and the splendid clearness of his phrasing." In 1831 he left Vienna with the intention of visiting London; but on his way to England he reached Paris and settled there for the rest of his life. Here again he soon became the favourite and musical hero of society. His connection with Madame Dudevant, better known by her literary pseudonym of George Sand, is an important feature of Chopin's life. When in 1837 his health began to fail, George Sand went with him to Majorca, and it was mainly owing to her tender care that the composer recovered his health for a time. The last ten years of his life were a continual struggle with the pulmonary disease to which he succumbed October 17, 1849. The year before his death he visited England, where he was received with enthusiasm by his numerous admirers. A distinguished English amateur thus records his impressions of Chopin's style of pianoforte-playing compared with those of other masters. "His technical characteristics may be broadly indicated as negation of *bravura*, absolute perfection of finger-play, and of the *legatissimo* touch, on which no other pianist has

ever so entirely leant, to the exclusion of that high relief and point which the modern German school, after the examples of Liszt and Thalberg, has so effectively developed. It is in these features that we must recognize that *Grundverschiedenheit* (fundamental difference) which according to Mendelssohn distinguished Chopin's playing from that of these masters, and in no less degree from the example and teaching of Moscheles. . . . Imagine a delicate man of extreme refinement of mien and manner, sitting at the piano and playing with no sway of the body and scarcely any movement of the arms, depending entirely upon his narrow feminine hands and slender fingers. The wide arpeggios in the left hand, maintained in a continuous stream of tone by the strict legato and fine and constant use of the damper-pedal, formed an harmonious substructure for a wonderfully poetic cantabile. His delicate pianissimo, the ever-changing modifications of tone and time (*tempo rubato*) were of indescribable effect. Even in energetic passages he scarcely ever exceeded an ordinary mezzoforte. His playing as a whole was unique in its kind, and no traditions of it can remain, for there is no school of Chopin the pianist, for the obvious reason that he could never be regarded as a public player, and his best pupils were nearly all amateurs."

A detailed analysis of Chopin's single works would be impossible. The following is a list of the most important of his compositions:—Two concertos for pianoforte, with orchestra, in E minor (Op. 11) and F minor (Op. 21) respectively; trio for pianoforte and strings, in G minor (Op. 8); three sonatas for pianoforte solo (Op. 4, 35, 58); one for pianoforte and violoncello (Op. 65), G minor; fifty-two mazurkas, contained in the collections numbered Op. 6, 7, 17, 24, 30, 33, 41, 50, 56, 59, 63, 67, 68 (Nos. 50–52 without number of Op.); études (Op. 10, 25); nocturnes (Op. 9, 15, 27, 32, 37, 48; 55, 62, 72); preludes (Op. 28, 45); polonaises (Op. 3, 22, 26, 40, 44, 53, 61, 71); valses (Op. 18, 34, 42, 64, 69, 70); besides numerous variations, impromptus, and other miscellaneous compositions, also settings of seventeen Polish national songs for one voice, with pianoforte accompaniment. Franz Liszt has written a charming sketch of Chopin's life and art (*F. Chopin*, par F. Liszt, Paris, 1851), and a very appreciative though somewhat eccentric analysis of his work appeared anonymously in 1842 (*An Essay on the Works of Frederic Chopin*, London). A complete and excellent collection of Chopin's pianoforte works in 6 vols. has been edited by K. Klindworth. (F. H.)

CHOREA, the scientific name of the disease popularly known as St Vitus's Dance.

CHORLEY, a manufacturing town of North Lancashire, England, is situated eight miles south-east of Preston on the River Yarrow and the Leeds Canal, and on the Lancashire and Yorkshire Railway. The town, which has a weekly market, is well built and is abundantly supplied with water. It contains an old church in the Norman style with some interesting monuments, and several dissenting chapels. A town-hall has been erected recently at a cost of £30,000. Chorley is the seat of a considerable manufacturing industry. Numerous mills have been erected within and around the town for the manufacture of calico, muslins, jacconets, and fancy goods, while several bleach-fields and print works are in the immediate neighbourhood. Railway-waggon building is extensively carried on. The district contains a number of coal mines and stone quarries. The area of the parish, which forms a local board district, is 3614 acres; the population in 1861 was 15,013, and in 1871 16,864, of whom 7910 were males and 8954 females.

CHORUS. See DRAMA and MUSIC.

CHOSROES. See KHOSRU and PERSIA.

CHOUANS (a Bas-Breton word signifying screech-owls), the name applied to the royalist insurgents in the west of France, at the time of the Revolution. It has been suggested that the name arose from the cry they used when approaching their nocturnal rendezvous; but it is also maintained that it was derived from a nickname applied to their leader Jean Cottureau. Originally a contraband manufacturer of salt, Cottureau had been seized in a scuffle

with the Government officers, and condemned to death, but his mother's entreaty gained his pardon from Louis XVI., and he never forgot his benefactor. He then became a soldier but deserted, and was imprisoned; on his release he settled down in a legal occupation, and joined the national guard. On the outbreak of the Revolution he gathered round him a band of royalist peasantry with whom he retired to the wood of Mison, where they lived in huts and subterranean chambers. From Lower Maine the insurrection soon spread to Brittany, and throughout the west of France. In 1793 Cottereau joined Laval with some 500 men; and the band grew rapidly and swelled into a considerable army, which assumed the name of La Petite Vendée. Cottereau greatly distinguished himself by his personal bravery and his military ability. But after the decisive defeats at Lo Maus and Saveuay, he retired again to his old haunts in the wood of Mison, and resumed his old course of guerilla warfare. Misfortunes here increased upon him, until through treachery he fell into an ambuscade and was mortally wounded. He died among his followers, July 28, 1794. Ignorant as he was, he appears to have been a man of no slight ability. His gratitude was intense; and his magnanimity was such that he is said on several occasions to have spared those who had most deeply injured him. After the death of Cottereau, the chief leaders of the Chouans were Georges Cadoudal and a man who went by the name of Junibo d'Argent. For several months the Chouans continued their petty warfare, which was disgraced by many acts of ferocity and rapine; in August 1795 they dispersed. See Duchemin-Descepeaux, *Lettres sur la Chouannerie*; Seguin, *Histoire de la Chouannerie*; and Muret, *Histoire des Guerres de l'Ouest*.

CHRESTIEN, FLORENT (1541-1596), a satirist and Latin poet, was the son of Guillaume Chrestien, an eminent French physician and writer on physiology, and was born at Orleans. A pupil of Henri Estienne, the famous Hellenist, and a zealous Calvinist, at an early age he was appointed tutor to Henry of Navarre, afterwards Henry IV., who made him his librarian. De Thou says of Chrestien that he was an excellent man, a man of such an enlightened and noble soul that he was incapable of writingught from a base and servile complaisance, but that it was not safe to irritate his Calvinism, as if that were done he hit hard and straight, trusting to reconciliation afterwards. Florent Chrestien was the author of many good translations from the Greek into Latin verse,—amongst others, of versions of the *Hero and Leander* attributed to Musæus, of several plays, and of many epigrams from the Anthology, all of which were enriched with excellent notes and commentaries. In his translations into French, among which are remarked those of Buchanan's *Jephthes* and of Oppian *De Venatione*, he is not so happy, being rather to be praised for fidelity to his original than for excellence of style. He wrote in verse against Ronsard, and in prose against Pibræ, the apologist of the Saint-Bartholomew; but his principal claim to a place among memorable satirists is as one of the authors of the *Satyre Menippée*, the famous pasquinade in the interest of his old pupil, Henry IV., his share in which, however, cannot now be exactly determined.

CHRESTIEN DE TROYES, the most eminent of the early French writers of romance, was born at Troyes in Champagne in the 11th century. Nothing whatever is known of his life; but from the fact that several of his works are dedicated to Philip of Alsace, count of Flanders, it is conjectured that he was attached to the court of that prince. He was much esteemed and highly praised by his contemporaries, and by the writers of the century following, and not without reason, being a master of style, and possessing in an eminent degree the qualities of invention

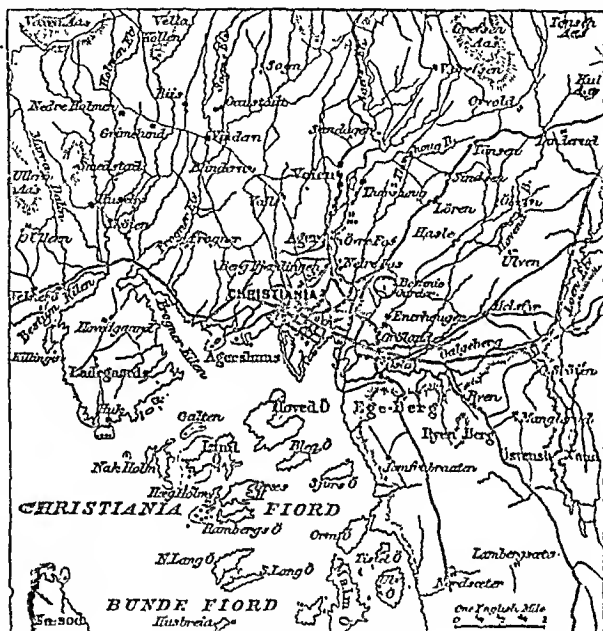

and conduct, together with great purity and range of thought, and a remarkable knowledge of men and manners. His books, therefore, apart from the interest attached to them as specimens of the mediæval epic, and by reason of their relation to the rest of the Arthurian literature, and in spite of the difficulties and crudities of the unformed language in which they are written, are still readable, and are rich in instructive details concerning the age that gave them birth. Many romances are attributed to Chrestien des Troyes. Modern criticism has selected six only as undoubtedly his. These are—(1) *Irec et Enide*, which contains some seven thousand verses, and which has supplied the materials for one of the legends of Tennyson's Arthurian cycle; (2) *Oligès*, or *Oliget*, a second Round Table romance; (3) *Le Chevalier au Lion*, containing nearly seven thousand verses, an offshoot of the Arthurian legend, if not absolutely forming part of it; (4) *Guillaume d'Angleterre*, a specimen of a more modern style, containing three thousand three hundred verses; (5) *Le Chevalier de la Charette*, a romance of nearly seven thousand verses, written by Chrestien and continued by Godefroid de Laigny, the hero of which is Lancelot du Lac; and (6) *Perceval le Gallois*, a poem of twenty thousand verses, begun by Chrestien and continued by Gantier de Deuic and by Menassier,—perhaps the earliest instance of that alliance of the Holy Grail and Round Table legends which enjoys such an immense popularity in the Middle Ages.—translations and imitations of which have appeared in English, French, German, Spanish, Flemish, and Icelandic. Two other romances are known to have been written by Chrestien,—*Tristan, ou le Roi Marc et la Reine Yseult*, and *Le Chevalier de l'Épée*, but these are wholly lost; and he is credited with the authorship of six songs and of several Ovidian translations or imitations still unpublished.

CHRIST (Χριστός, *the Anointed One*), the official title given in the New Testament to Jesus of Nazareth, equivalent to the Hebrew *Messiah*. See *JESUS CHRIST*.

CHRISTCHURCH, a parliamentary borough of South Hampshire, England, is situated at the confluence of the rivers Avon and Stour, 1½ miles from the sea, 22 miles S.W. of Southampton, and 111 miles from London by rail. Its history commences in Saxon times, when it was known as *Treconateam*, a name which continued till recently in the form of Christchurch Twiucham. The town, which is nominally governed by a mayor, recorder, and councillors, consists of two long irregular streets. It manufactures chains for clocks and watches, and hosiery, while the salmon fishery employs some hands. It is, however, to its priory church that it owes its distinction. This building, which is a conspicuous object at sea, belongs partly to the Norman and partly to the Perpendicular styles of architecture, and is one of the best specimens of its kind, measuring 311 feet long by 104 broad. It was first established as an Augustinian priory by Baldwin, earl of Devon, in the 12th century, and thereafter received successive grants from the Crown. Within recent years the work of restoration has been carried on to a considerable extent. The church contains a very fine rood screen of the 14th century, a chapel of the 16th century, built by Margaret, countess of Salisbury, an altar tomb of the same century with effigies, and many other objects of architectural interest. A monument has been erected in the Western tower to Shelley the poet. Little remains of the old castle but an adjoining ruin called the Norman House, which is supposed to date from the time of Henry II. The population of the town in 1871 was little over 2000, but the parliamentary borough, which extends to 22,350 acres and includes the greater part of Bournemouth and the parish of Holdenhurst, contained 15,415 persons; it returns one member to parliament.

CHRISTCHURCH, the capital of the province of Canterbury, New Zealand, is situated in $43^{\circ} 34'$ S. lat. and $172^{\circ} 35'$ E. long., on both banks of the small river Avon, about five miles from the sea. It is built upon the great Canterbury plain, which here is a dead level, though the monotony of the site has been much relieved by extensive plantations of English and Australian trees. The town is about a mile square, and the streets, which are wide and well paved, cross one another for the most part at right angles. Christchurch contains a number of handsome public and private buildings, is lighted with gas, and is amply supplied with water from numerous artesian wells. It is the centre of the rapidly extending railway system of the province, and is connected with its port, Lyttelton, by a line eight miles in length, which penetrates the hills enclosing Port Cooper, on which Lyttelton stands, by means of a tunnel a mile in length. The population of the municipality of Christchurch in March 1876 was officially estimated at 10,750, and that of the electoral district at 13,000.

CHRISTIANIA, the capital of Norway and of a stift of the same name, is situated about 80 miles from the sea, at

Environs of Christiania.

the head of the Christiania fiord, at the foot of the Egeberg, in a finely-wooded and picturesque neighbourhood, in $59^{\circ} 54'$ N. lat. and $10^{\circ} 45'$ E. long. It is the seat of the king and of the Storthing or Parliament, of the Hoieste-ret or final court of appeal, and of the bishop of the stift. The new

town, or Christiania proper, was founded in 1624 by Christian IV.; the old town, Opslo, commenced in 1058 by King Harold Haardrada, formerly the capital, is now only one of the suburbs of Christiania. The fortress of Agershuus defends the fiord and the greater part of the town; it contains the regalia and national records, and its ramparts afford an agreeable promenade. The streets of Christiania are at right angles to one another, and are lighted by gas; the houses, except in the suburbs, are of brick or stone, and are mostly two-storied. Amongst the buildings may be mentioned the royal palace, containing some of Tidemand's best pictures; the cathedral, a brick edifice in the shape of a Greek cross; the university, founded in 1811, opened in 1813, with a library of about 150,000 volumes; the legislative hall; the free museums; the observatory; the naval, military, and art schools; the lunatic and two orphan asylums; the prison, near the Opslo Kirke; the railway station, Freemasons' Hall, Athenæum, two theatres, and the large dining-hall or Damp-Køkken. The botanical gardens, about a mile from the town, contain a large collection of plants from Spitzbergen and Iceland. The industrial establishments of Christiania and the circumjacent amt of Agershuus include weaving and cotton-spinning factories, paper and saw-mills, soap and oil works, distilleries, breweries, and tobacco manufactories. As a place of commerce Christiania has surpassed Bergen, and is now the first port of Norway; by the extension of its railway communications it has also become the chief emporium for the inland produce of the country. Its exports are wood, pitch, hides, seal-skins, oil and linseed cake, fish-manure, herrings, anchovies, stock-fish, and iron; and it imports wheat, salt, hardware, wines, preserved fruits, and fancy goods. In 1871 the total value of the imports was about £2,151,225; the vessels that entered the port in 1872 were 1787, of total tonnage 393,598, out of which 143 steamers and sailing-ships were British. The customs duties in 1873 amounted to £329,175. Christiania is in steam communication with Gothenburg, Copenhagen, Lübeck, Hamburg, Amsterdam, London, and Hull, as well as with various places on the fiord, and all the ports of Norway. The town is healthy and has an excellent supply of good water. In winter its average temperature is 23° Fahr., in summer $59^{\circ} 9'$, giving an average for the year of $41^{\circ} 4'$. The harbour during three or four months of the year is ice-locked, and ships then lie at Drobak, about 18 miles south of the town. The population, which in 1812 did not exceed 10,000, had in 1835 reached 21,757; and at the end of 1873 it was 72,725 or, with that of the suburbs, about 83,000.

CHRISTIANITY

CHRISTIANITY is derived from the adjective *Christian*, which is formed from the name *Χριστός*, the Anointed, and means the religion introduced by Jesus Christ and communicated by Him to His circle of followers.

The Christian religion is the result of two factors, neither of which can be omitted if a true description is to be given. On the one hand there is the objective element, which consists in the manifestation and revelation of God to His people for the purpose of salvation; and on the other side there is the subjective element, which consists in the appropriation of this manifestation and what it implies by man through faith. Both elements enter into and form the constituent elements of a new life, which all Christians share in common, and which is the essence of Christianity. This common life of Jesus and His people has many ways by which it can make itself seen and known. Christians have from the beginning exercised no

small influence upon the ordinary political and moral life of the world. They have been able to effect changes in generally received moral ideas and maxims. They have altered the course and character of legislation. They have introduced new opinions and beliefs. They have formed fellowships for worship, built places of meeting, held councils and assemblies, and in many ways given evidence of their presence and power in the world. But it must always be remembered that Christianity is neither the church simply, nor theology, nor Christian ethics. It is more than all these put together. The common life of Jesus and His people, which is the core of Christianity, manifests itself in an outward visible organization for the purpose of worship, which is commonly called the church (see **CHURCH**). But this worship is not Christianity; still less are the various institutions and ceremonies according to which worship is carried on.

Christianity cannot help powerfully affecting the whole of the intellectual side of man's life. The spiritual events on which it rests must have their rationale, and the spiritual forces which course through it must have their rule, and man must more or less comprehend them, and assimilate them. The Christian cannot help having a very different idea of God from that held by Aristotle or Plato. The Christian regards sin as something which affects the whole human race, while the pagan believes it to be the mistake or misfortune of individuals. Christianity cannot help remoulding the beliefs and opinions of mankind, but theology and Christianity are two very different things.

The Christian is moved by moral impulses and guided by moral principles which are peculiar to himself. He cannot look on marriage, for example, from either the purely economic or the purely sensuous point of view. He cannot help reorganizing the scheme of virtues, and giving to the principle of love a pre-eminence which it has not in pagan ethics. Christianity cannot help putting a new face on morality, but Christian ethics and Christianity are still not one and the same thing.

Christianity includes all these and much more besides. It is nothing less than the whole round of human life in all its various departments in so far as it is related to and illumined and dominated by the divine love revealed in Jesus Christ. It is the presence of Jesus among His people and all that is implied in such a presence.

Christi-
anity and
Christ.

The close and inseparable connection between Jesus Christ and Christianity, which is implied in the name, and which study only makes more and more evident, produces the inevitable consequence that our view of the nature and characteristics of Christianity must depend on the answer which we give to the question which Jesus himself put to His disciples—"Whom do ye say that I, the Son of man, am?" There are different theories of Christianity, because there are different theories of Christ, and in order to know how various conceptions of the nature of Christianity arise it is necessary to be familiar with the various views which men have held and hold about the nature and work of Christ. For example, different theories of Christianity arise when we ask what was the relation existing between Jesus and what went before Him, what was the relation in which Jesus stood to His contemporaries and His immediate followers, what is the connection which subsisted between Jesus and the future. All these inquiries reveal different theories about the nature and work of Christ, which are reproduced in different theories of the essential nature of Christianity, and enable men whose opinions and principles are widely different to call themselves, to their own satisfaction at least, Christians.

The rela-
tion of
Christ and
Christi-
anity to
what went
before.

Jesus Christ claimed to have a definite relation to the past history of that people among whom He was born. In His teaching He put himself at the end of the Old Testament, and declared that He came to fulfil the Law and the Prophets. Christianity, therefore, however it be explained, has a close connection with Judaism, and the religion of Jesus cannot be considered without regard to the religion of Moses. This is now universally acknowledged, however variously the relation between the two may be explained. Criticism finds an ample confirmation of the claims of Christ in the intimate connection in which His teaching, life, and work stand to the Old Testament and the past life of the inspired Hebrew people. The whole of the Mosaic dispensation, the whole of the Jewish economy, with its prophecy, priesthood, and kingship, is recognized as summed up in the person and work of Christ. The Old Testament, which without Christ is but a collection of sacred books written at different times and in various manners, is regarded when looked at through Christ as an harmonious whole of anticipatory revelation. Indeed, one of the chief

differences which critical apologetic finds between the Old Testament and other so-called sacred books is, that Christ is at the end of the Old Testament, and that no other scriptures have such a conclusion. But all this implies that Christianity is a development from Judaism, and that our idea of the one will be modified by our conception of the other. Those who refuse to admit that Judaism is more than one of the many natural religions of mankind can hardly admit the supernatural character of Christianity, or regard it in any other light than as the outcome, perhaps the highest outcome possible, of that side in man's nature which has been called by some the religious faculty. Those who attempt to derive Mosaic institutions from Egypt, who seek the basis of Hebrew prophecy in epileptic tendencies, and see nothing in the theocratic idea which was not suggested by ordinary kingship, cannot have much difficulty in analyzing Christianity into the natural development of the religious sentiment aided by a somewhat extravagant enthusiasm. Those, on the other hand, who find it impossible to accept the assumptions, and to get over the innumerable difficulties attending the naturalist theory of the Old Testament and of the history of the Hebrew people, find in Christianity something different in kind as well as in degree from all natural religions. Modern criticism even of the negative kind often indirectly supports the supernaturalist theory of the Old Testament and of Christianity, for its fundamental maxim, that waters cannot rise higher than their source, has proved the impossibility of explaining away Old Testament institutions and New Testament truths into merely the natural outcome of the religious faculties of a peculiar people. It has proved that the Old Testament religion contains materials which were not got from the intercourse of the Jews with other nations, and which did not arise naturally from the geographical position or the ethnographical characteristics of the Hebrew people. It has shown that the Old Testament religion was not a natural stream gathered from many a smaller rill, but came forth gushing, like the water of Hebrew history, from the Rock which contained it; and in doing so it has given its testimony to the altogether unique and supernatural character of Christianity.

The relation of Jesus to His contemporaries, and of His disciples and their writings to the founders of the various ethnic religions, is another point whence proceed various views of the nature of Christianity. The old deist view, adapted and intensified by the Encyclopedists, that Jesus was a charlatan, that His disciples were partly cheats and partly dupes, and that Christianity was founded in fraud and perpetuated by decoit, has to all intents and purposes disappeared. But many believe that Christianity is only one of the many religions which are all of them true though none of them contain the whole truth. The modern notion of evolution has been called in to enforce this view, and Christianity is explained to be the most perfect development yet reached by the religious spirit of mankind; while the character of Jesus and the New Testament writings are explained on the same principle. On theories of this kind Christianity is the production of the natural forces of the period which gave birth to it, and contains nothing which cannot be traced back to the circumstances of the time, and the conditions of humanity. All such theories commonly rest on the general principle that the supernatural is impossible, and that whatever involves a miracle is *ipso facto* incredible, and then proceed by means of some special principle to explain the presence of facts which seem to imply the supernatural. (See article APOLOGISTICS.) These principles are used to explain not so much the origin of Christianity itself as the origin of the Christian writings of the New Testament, and the production of the scheme of doctrine and morals therein

contained. Perhaps the most ingenious of these theories is that cluster which has been produced by the writers of the Tübingen school, who have suggested the general method which has been almost universally followed by anti-supernaturalist writers. The method is by an ingenious negative criticism to separate between the original elements of Christianity as these were present in the mind of Jesus and communicated by Him to His disciples, and those elements which were afterwards added by more philosophical adherents, and to explain how, out of the conflict between the two opposite tendencies of Judaism and anti-Judaism, the various and conflicting elements at last settled into a somewhat harmonious whole. By this ingenious method Jesus is reduced to the position of a Jewish rabbi, not much more noticeable than some of his contemporaries, and Christianity is not the religion of Jesus, but what grew out of that religion when it was subjected to the influences of Roman civilization, Greek philosophy, and Eastern theosophy. Such theories are unsupported by external, and rest confessedly on internal evidence. The weakness of internal evidence when unsupported by external is well known, and in this case the internal evidence is anything but strong. There are many serious objections to be taken to the Tübingen hypotheses (see article BIBLE) merely as hypotheses, and these difficulties are so great that it is almost evident the hypotheses would never have been put forward unless the anti-supernaturalist idea of Christianity had been taken for granted at the outset. There can be little doubt that if the supernatural be admitted these various hypotheses, while they suggest some difficulties which have not yet been solved, will be found to be at variance with the plain results both of external and internal evidence.

On the other hand those who believe in the supernatural take a different view of the relation of Jesus to His contemporaries. He was no mere Jewish rabbi, but spake as never man spake, and did what never man did. He was the manifestation of God, and came to give by His presence, person, and work, as well as by what He said, the full revelation of God. He was while on earth the centre of the world's history, to whom all had looked forward, to whom all look back. And Christianity is not the simple product of the contemporary philosophical and religious systems, but is the embodiment of the unique appearance and work of Christ.

The relation in which Christianity stands to the future is also a basis on which various views of its nature have been rested, according to the theory of the peculiar powers of diffusion and propagation which it is supposed to possess. Anti-supernaturalists consider Christianity to be merely a moral force, acting through mere moral enlightenment; but this has already been sufficiently dwelt upon. There are, however, what may be called two Christian views of the *modus propagandi* of Christianity, which produce two of the real nature of Christianity itself. This difference of view is best seen in the variety of answers given to the question how Christianity subsisted after the departure of Christ, and how it subsists now from age to age, a more or less compact organic life in the world. The various answers given may be roughly placed in two classes as they lay stress on the spiritual or the mechanical side of the process, and enlarge on the spiritual or the mechanical influences at work. Those who take what may be called the spiritual view of Christianity hold that it was sustained after the ascension of Christ by the mission and work of the Holy Spirit, whose presence and influence enable it to go on from age to age, spreading in the world and developing according to the laws of its growth. And they believe that as the chief result of Christ's work consisted in a change of moral relation between God and those for whom

Christ died, the spread and permanence of Christianity is purely moral, and manifests itself mainly in a change of will. Of course all this takes place in special ways and by appropriate means. These means are called the means of grace, and are usually held to be the Word, Sacraments, and Prayer; but it is always to be understood that all such means are secondary or subordinate, and that the primary means of grace is the Holy Spirit, who works through these subordinate means, but may and does work in other ways. It is always understood that the operations of the Spirit cannot be limited to special actions nor confined by mechanical laws. On the other hand those who look at Christianity from what may be called the mechanical point of view are inclined to lay stress upon the means by which the Spirit works. They do not ignore the mission of the Holy Ghost nor His work, but are apt to say that He works only in certain prescribed ways, and through one set of means, and the tendency is to lay almost exclusive stress on one set of subordinate means—the Sacraments, and to represent that the persistence and spread of Christianity depend upon the constancy and correctness of sacramental ceremonies.

These opposite views of the nature of Christianity depend upon differences of dogmatic conception which may be briefly indicated. All through the one view, a change in the relationship between God's will and man's will is held to be the fundamental result which flows from the work of Christ. All through the other view man's nature rather than man's will is considered, and the result of Christ's work is looked on rather as a process within human nature than as a change in moral relations between man and God. In this way the progress of Christianity is looked on as the gradual semi-physical impregnation of human nature by the nature of Christ, a prolongation of the Incarnation rather than a development of the consequences of the finished work of Christ, to be produced by keeping Christ incarnate in the sacrifice of the Mass and impregnating mankind by means of Transubstantiation in the Sacrament of the altar. The one view is the view of churches which have accepted the Reformation, the other is that of churches which have not.

These various conceptions of Christianity may be further illustrated by the views which are held by the partisans of each concerning the relations between Christianity and the Bible. The Bible and Christianity cannot be separated, but different opinions may be and have been held about the relation in which the two stand to each other. On the one hand naturalists, and those who take the mechanical view of Christianity, are inclined to regard the Bible chiefly as a compendium of abstract truths, which may be condensed into dogmas and summarized in creeds; while those who take the spiritual view of Christianity regard the Bible as the medium which reveals God and His gracious dealings personally to the believing reader or hearer. To the one the Bible is a quarry of doctrines to be rationally criticized or implicitly accepted when once stamped as genuine by the church, to the other it is above all things a means of grace which the most ignorant can use and profit by. To the naturalist the Bible has been formed by the church, it is simply the natural production of the minds of those who formed the old Jewish and the early Christian communities, and grew to be what it is without the aid of superhuman intervention. To those who have adopted a mechanical view of Christianity the Bible is also the product of the church, but of the supernatural power in the church, and has grown to be what it is because it has been sanctioned by the church. To those who take the spiritual view of the nature of Christianity, the Bible, on the other hand, is and always has been the formative power in the church and that round which the

Christianity and the Bible.

church gathers itself, for it is the presence of God speaking to His people.

Both naturalists and those who hold a mechanical theory of Christianity agree in holding that there is an external sort of development in the Bible, and that the church can go beyond the Bible, whereas those who hold the spiritual view of Christianity deny both these positions. Naturalists hold that one part of the Bible is beyond the other, and since the Bible is simply the outcome of man's religious thoughts and feelings in certain ages and places, they believe that men now may give utterance to thoughts and sentiments which in depth of feeling and insight may surpass those contained in the Bible. The Tübingen theologians, for example, believe that the New Testament is a series of deposits of religious truth, in which the truths taught by Jesus are supplemented by the teachings of His disciples, by the lessons of Paul, and by the theories of Christians educated in the philosophy of Greece; while Dr Newman considers that the church, in virtue of a supernatural gift bestowed upon her, can add to the doctrines contained in the Bible according to certain well-defined lines of development. On the other hand those who hold the spiritual view of Christianity believe that the church can never go beyond the Bible, and that progress in Christian theology means greater insight into the manifestation of God in the Bible and greater power to interpret the supernatural facts and forces made known therein.

The various theories differ also in the closeness of connection which they think subsists between Christianity and the Bible. The naturalist and those who put the church above the Bible as the formative power in Christianity both make the relation between Christianity and the Bible a purely intellectual one, whereas those who hold by the spiritual view make the Bible a means of grace and not merely the quarry whence to hew theological dogmas. But the naturalist agrees with spiritual Christians in maintaining the authoritative character of the Bible, while the mechanical Christian sets the Bible aside when it does not agree with church tradition. With the naturalist, however, the Bible is authoritative because it is the only set of documents which tell him about Christianity in its primitive state. It is authoritative because it is the only witness to the historical facts of Christianity, not because it is to be a law to him. To the spiritual Christian, on the other hand, the Bible is authoritative because it is a revelation of those spiritual forces and a record of those spiritual events on which Christianity still depends, and which teach him the way of salvation.

Definition.

To sum up, then, Christianity claims to be no mere social revolution or natural step in the march of human progress. It is a religion whose sources are not to be found within man's nature but outside of it in the saving revelation of God in Christ, and Jesus is thus the author and giver of an eternal life which spreads itself and is maintained, not by mechanical contrivance, but by the living Spirit of God entering into human history, and building on the basis of reconciliation a kingdom of God which is both human and divine, and which comes and comes again and again in wave after wave of developing completion until the will of God is done on earth as in heaven.

Preparation of the world for the entrance of Christianity.

Christianity began its career in the world at a time singularly propitious both politically, socially, and religiously for the advent of a new universal and spiritual religion.

Even apart from the entrance of Christianity the reign of Augustus over the whole Roman empire was an epoch-making period. Never before had the various races of mankind been united under one universal empire which promised to be permanent. For the Roman power was different from the governments of Asiatic adventurers and Greek warriors. Where Rome planted her foot was fated

to remain Roman. The ancient Asiatic empires had been for the most part the creation of victorious generals, and had been kept in life only by a tolerably rapid succession of dynasties; their power seemed to depend on the character of the individual ruler. And the empire of Alexander, while more enduring, was not coherent. But from the beginning of her conquests the spirit of Rome herself seemed always to be greater than the vigour and ability of her generals and rulers, and she alone of empires seemed to be indifferent to the precarious stability of government ensured by regular dynastic succession. "The Romans conquered like savages, but ruled like philosophic statesmen, till, from the Euphrates to the Atlantic, from the shores of Britain and the borders of the German forests to the sands of the African desert, the whole Western world was consolidated into one great commonwealth, united by bonds of law and government, by facilities of communication and commerce, and by the general dissemination of the Greek and Latin languages." The world had a centre as it never had before, and the golden threads of well-established government connected all the world with Rome. Roads were made connecting Rome with the remotest countries, and a system of posts established which provided for easy communication with the capital. Military colonies carried Roman usages and manners, civilization and privileges, to the remotest corners of the empire. Magnificent cities were built in such outlying dependencies as Britain, Gaul, and Germany. The arts and civilization were gradually extending their dominion and subjugating the most distant and most desolate places. To all this Augustus added a more perfectly devised centralization which made the empire a more compact whole, so that any new influence made its throbs felt from centre to extremities in a wonderfully short time. The world was made ready for the furtherance of the spread of opinions as it had never been before, and for becoming spell-bound by invisible spiritual laws like those which Christian morality weaves around its disciples. The time of Augustus, if it was the beginning of the decline and fall of the Roman empire as a visible earthly dominion, was also the beginning of its permanent establishment on earth in a purely invisible way, when its policy, statesmanship, and legislation were to pass into all the nations of the earth and become part of their lives so long as the world endured.

Socially, too, the world was wonderfully ripe for the entrance and spread of a universal religion. Slavery it is true flourished, and there were conquerors and conquered, privileged and unprivileged classes. But the beginning had already been made of that lavish distribution of Roman citizenship which laid the foundation of a common political life throughout the empire.

The religious character of the times was also marvellously adapted for furthering the advance of Christianity. The old national creeds were fast disappearing, and were being submerged in the vast cosmopolitan religion of Rome. It was the wise custom of conquering Rome to do nothing to disturb the religions of the peoples subdued by her armies, and commonly the principal deities of the conquered nations were added to the overcrowded pantheon of Rome. This religious tolerance or indifference gradually began to eat the heart out of paganism, and all over the civilized world the pagan creeds sat lightly on their worshippers. The various deities were looked on as interchangeable manifestations of a supreme fate-power who reigned alone in the invisible world, while in this visible earth the genius of Rome seemed to be the one object of worship. The old national religions with their well-defined outlines and limits were being gradually effaced, and men were longing for some religion which, while it had the universal character which the times required, should have more individuality.

personal power in it than were supplied by the thoughts of a supreme spiritual fate, or by the mere materialist conception of the genius of Rome. And all this bred a thirst for information about sacred things which was unknown in earlier times. The claims of conflicting religions were philosophically discussed, and amid all the gross materialism of the period there were longings for some deeper, truer religion than any they had known. These longings were further stimulated by the gradual but almost universal advance of new religious ideas coming from the far East, which was then regarded as the cradle of science and philosophy. In the 5th century before our era the vast Buddhist movement had overspread all the East from Thibet to Ceylon, and the Greek and Roman conquests in Asia brought Europe within the intoxicating influence of its subtle religious ideas. This strange Eastern theosophy, which during the first four centuries of our era is known by the name of Gnosticism, had a most powerful influence on the old religions of the West, which seemed to dissolve under its touch. Everywhere in the art and literature of the period we find its prevalence in the West during the age of Augustus and his successors. It insensibly undermined the beautiful sensuous mythology of Greece and the harder sterner religion of Rome, and substituted for them a religion in which, if fear was the prevailing emotion, worshippers still felt that there was more spirituality and greater claims to universality than their old national religions could give. And thus the gradual defacement of old religious outlines, the stimulation of strange cravings to know the mysteries of nature and of worship, and the longing for rest in a universal religion of deliverance prepared the world for the coming and spread of the religion of Jesus Christ.

The great problem Christianity had to face and to solve was one of no ordinary difficulty, and one involving a number of side issues which greatly perplexed the early church. The practical side of the problem, as it met the early Christians may be put thus:—How could Christianity, which was rooted in Judaism, be at the same time a religion equally open to Jew and Gentile; how could the exclusiveness of Judaism and the utter want of exclusiveness in Christianity be reconciled with each other? And the solution of this problem brought the early Christians into conflicts of a special kind with the government and philosophy of the times.

When Jesus proclaimed His mission, and when He sent forth His disciples on preaching tours to make known himself and His work, we find the phrase "kingdom of heaven" perpetually occurring; and it was this phrase and what it suggested that brought the early Christians face to face with the great problem they had to solve. When Jesus announced that the kingdom of God was at hand, His message was quite intelligible to His Jewish audiences. The phrase was sacred and familiar, and their thoughts went back at once to the old theocracy of Israel. And when after the death and ascension of our Lord, His Jewish believers got a truer and deeper insight into the meaning of the expression, still the idea it conveyed bound Christianity, with bands that could not be untied, to Judaism, the Old Testament Scriptures, the miraculous life of the Jewish nation, and the ideal Israel long expected and long announced. Throughout the Old Testament Scriptures we find three ideas connected with the thought of the kingdom of God. It implied first and primarily the share in the inheritance in the land which the Lord gave to His people and to their children; and then it implied security in this possession, deliverance from Egypt and a succession of enemies, and, lastly, the possession of an inward spring of covenant life, which guaranteed them both salvation and possession. These three things were the historical and

material basis on which rested the whole spiritual and prophetic superstructure of the ideal kingdom of God, which lay enshrined in the heart of every devout Hebrew. When our Lord by His preaching, by His life, death, and rising again, and by His mission of the Holy Spirit, gave new meanings to these thoughts, He only widened, deepened, spiritualized, and gave personal point and application to what the prophets and holy men of old had already declared. And when He and His apostles guided by His Spirit taught His early followers that His kingdom of God meant possession of the spiritual blessings of God's grace, and deliverance from sin, death, and Satan, and a life of adopted sonship which guaranteed them in all these blessings, devout Jews could feel that now they were only learning what the prophets had taught, and they rejoiced in the thoroughgoing oneness which existed between the kingdom of God as proclaimed in the Old Testament and the kingdom of heaven which Jesus preached. But if it was a *sine qua non* that Christianity should spring out of the Old Testament Scriptures and be identical in all essentials with the Old Testament church, it was no less necessary that it should be now a religion for Gentiles as well as Jews, and here the difficulty emerged. Could the old Jewish church be carried over into the Christian church if all that outwardly distinguished it were abolished? Could the continuity be preserved if the ceremonies and restrictions which made up the visible life of the Old Testament worship were no longer to be observed? Would not the Old Testament church be entirely destroyed and the continuity between it and the New Testament church be done away with if the Old Testament ceremonial law was abandoned? So long as the members of the Christian church were Jews only or Gentiles who had become proselytes the difficulty was not felt. The Christians had not openly broken with Judaism, and were acknowledged even by their Jewish opponents to be a Jewish sect,—a sect everywhere spoken against it is true, but still a sect just as the Sadducees were a sect. But whenever Gentiles who were not proselytes became believers then a fierce struggle arose between those who thought that the continuity between the Old Testament and Christianity could not be kept up unless it were visibly perpetuated in those observances which distinguished the Jewish religion from all others, and those who were contented with a continuity which was more of the spirit than of the letter and the form. The practical shape which the struggle at first assumed was, whether Gentiles could be Christians without first becoming proselytes, and whether Jewish Christians must cease to be believers if they associated with Gentiles who had not been circumcised, and had not rendered themselves servants to the law of Moses. To understand the difficulty rightly it should be remembered that when the difficulty arose the New Testament canon was not in existence, and the church had to be guided mainly by the Old Testament Scriptures and the memory of Jesus preserved by the apostles. In spite of what has been advanced by critics of the Tübingen school, it seems evident that the apostles one and all in their letters to the church faithfully followed out the solution which Christ's discourses gave. In these discourses our Lord carefully distinguished between the permanent and the temporary elements in the Old Testament dispensation, and assumed that His office as Messiah gave him full authority to abolish or alter the latter. He also pointed out that the permanent parts of the Mosaic economy were the various modes of expressing that love to God and to man which He declared to be the sum of the law and the prophets. These were unalterable, but any change might be made in the subordinate and temporary elements, if only this great principle was more fully and better expressed by the change. This leading thought Christ used

as much to detect and condemn false developments of the Mosaic economy (*e.g.*, Pharisaism) as to test its true development in Christianity. The apostles of Jesus carried out the principles of their Master. There is not a trace in the epistles of Peter, James, and John of the idea that salvation and entrance into the kingdom of God could only be obtained by those who were first Jews and then Christians. There is no statement, for example, that Gentiles must be circumcised before they can be baptized. On the contrary, James speaks of the perfect law of liberty, and Peter and John have expressions equally strong. Within the writings of the apostolic circle everything goes to show that the church was taught from the beginning that Christianity was not to be confined within the limits of natural or adopted Jewish nationality.

But when we turn to the Acts of the Apostles, and to the epistles of Paul, especially to the Epistle to the Galatians, we find that the apostolic solution of the difficulty was not acceptable to the early Jewish Christians, and was not accepted by many of them. We even find that the practice of members of the apostolic circle was not always in accordance with the principles which they had enounced in accordance with the guidance of the Holy Spirit. There was a strong ultra-Jewish party in the early Christian church, which was able in some measure to control the conduct of the apostles themselves. And this was what was to be expected. Men who had been trained in Judaism, where the connection between religion and politics was so very close, whose religious thoughts were always expressed in outward ordinances, could scarcely avoid insisting upon some visible connection between Judaism and Christianity. They could not see that Christianity was the completion of Judaism if the practices of the Mosaic economy were not kept up. Thus we find at least two parties, a Judaizing and a Gentile party, in the early church. At first the Jewish party was so strong as to force a compromise upon the leaders of the Gentile church, and require that every Gentile Christian should at least become a proselyte of the gate by abstaining from things offered to idols, from things strangled, from blood, and from *πορνεία* or a breach of the Old Testament regulation about marriage; and it is probable that Jewish Christians were required to keep up all the practices of the Jewish religion and more especially to share in the sacrificial worship of the temple. Afterwards this Jewish party grew weaker, and it became the universal belief in the early church that Christians born Jews did not need to observe the ceremonial law of Moses or to share in the temple-worship, and that Christians born Gentiles did not require to show, by keeping certain Jewish regulations, that they were believers in a creed which was a development of Old Testament ideas. The capture of Jerusalem and the destruction of the temple separated the Christian Jews who were of the sect of the Pharisees from their fellow Christians, and the severe persecution of Jewish religion and rites which followed the revolt under Bar Cochba sent most of them over into the ranks of the Essenes, and thus the Christian church was left in peace to reconcile its intimate connection with Judaism with its abandonment of Jewish ritual on the principles of Christian liberty. But in solving the problem the early Christian church was scarcely true to the principles of its Master. In order to defend more strenuously their separation from Judaism, it was customary for the fathers of the church to look at Christianity as supplying in detail all that Judaism possessed, and this led them almost as far from the fundamental principles of continuity laid down by Christ as the old Judaizers had gone. They required a new law to set over against the old law of Moses, a new service to take the place of the temple service of the Old Testament, a new daily sacrifice, "the new law's

new oblation" instead of the sacrifices of Moses, a new ritual which after it had gradually grown complex enough was found to correspond bit by bit with the ritual of Jerusalem, and a new priesthood whose functions were to be not unlike the duties of the sons of Aaron. In church traditions, a ritual of worship, and a service of priests, they found the proof of their relation to the religion of the Old Testament, and forgetting the unseen continuity of sameness of spiritual principle, found a consolation in a fancied similarity in external routine of worship. In this way early Christianity succeeded and failed in realizing to herself the real continuity between the Old Testament and the New Testament kingdoms of God.

But if early Christianity found it difficult to reconcile the New Testament idea of the kingdom of God with the Old Testament conception, it was no less troubled when it came to work out this New Testament thought on the broad basis prepared for it by the existence and character of the Roman empire. There were difficulties without as well as difficulties within. Christians are men with bodies as well as souls, and Christian ideas tend to take sensible shape, sometimes false and sometimes true. No sooner had Christianity shaken off its Jewish thralldom than it seemed eager to botake itself to a new slavery—eager to lay down the kingdom of God on lines already furnished by the government of pagan Rome, or the creeds of pagan philosophy. At all events we can trace in early Christianity the workings of two subtle influences, the one of which strove to reduce the kingdom of God to a material and earthly empire, while the other would have dissolved it into a system of philosophy. The ecclesiastical empire of the Middle Ages and the scholastic theology overthrown at the Great Reformation were slowly built up by principles which Christianity almost unconsciously assumed during her long struggle with pagan Rome and with pagan philosophy.

The relation of Rome to Christianity was very peculiar. Both aimed at world-wide dominion, and the one was the very incarnation of polytheism, while the other forbade in the sternest terms all idolatrous worship. The Christians, while citizens of the great empire which ruled the world, found the idolatry which they hated and denounced interwoven inextricably with the law of the land, possession of property, social observances, and public ceremonies. And Christianity had scarcely emerged from Palestine when it found itself engaged in a hard to hard struggle with the imperial power of Rome herself.

The uniform policy of Rome was to respect the laws and the religion of the conquered peoples who came under her dominion. The Roman system of jurisprudence, it is true, was extended to all parts of the empire, and capital offences were generally tried according to Roman law before Roman tribunals; but, generally speaking, conquered nations lived under their own laws and were allowed to practise their own religions. By this wise policy Rome not only avoided stirring up religious wars, but contrived to be the religious and legal as well as political centre of all the conquered tribes. In one way only was the religion of the conquered interfered with, when the worship of the emperor was forced upon all his subjects. Whatever motives of policy urged this haughty indifference to all creeds, and this easy toleration of every form of pagan faith, they were in reality founded on an intense belief in the eternity and almost divinity of Rome itself. Rome had remained for ages and seemed likely to endure the Eternal City, and when all other feelings of reverence had fled, the heart of the genuine Roman was full of awe for the majesty and might of perenduring Rome. It was no mere servile adulation which led to the deification of the emperors. The emperor was God, and divine honours were paid to him because he was the visible symbol of imperial Rome making manifest its

The influence of Judaism.

The influence of Rome.

power and permanence. And it was a real feeling of worship that raised in every house the altar to the *divus imperator*, and spread over the whole of the Roman empire, jostling aside its myriad creeds, the one faith in Rome, in its power, its eternity, and its mysterious strength. It was in this way that paganism and Rome became almost synonymous, and that Christianity and Rome were foes from the first.

Rome never treated Christianity as other religions were treated. Gibbon tells us that the Romans were already somewhat intolerant of Judaism and extended their intolerance to the new Jewish sect, somewhat more intractable than their neighbours, which Christians were supposed to be. He also shows that Christians who had neither temples nor synagogues were supposed to be atheists, and so beyond the pale of toleration, and that the secret assemblies of Christians were supposed to have a hostile political meaning. But something more is required to explain the uncompromising hostility of Rome, especially when we find that latterly that hostility was strongest under the greatest and noblest emperors. Since Roman toleration was founded on public policy, there was an end of it with regard to a religion which was of no use in curbing a conquered people. The Christian religion was *nova* and *illicita*; it was not a national religion nor a recognized faith, and was a new and unaccountable phenomenon which might be, and most probably was, fraught with danger to the sacred state. We find, too, in many of Rome's ablest statesmen a strange instinctive dread of Christianity. They made inquiries about it and were watchful of it, and yet could get no real insight into it. They could not help noticing how in spite of edicts and persecutions Christianity was rapidly increasing; they saw how, with a daring which to them was simply inexplicable, it was nothing loath to match itself against the power of Rome. To the ears of these dark and jealous emperors came tidings of Christianity copying the jurisdiction of Rome in its ecclesiastical divisions of the land, of its success in the large towns in the empire, of its entrance into the army. They saw, too, what Constantine was the first to make use of, that Christianity acted in such a way upon the physical frame that Christian soldiers were stronger and braver than their fellows, and man for man and battalion for battalion were more than a match for the pagans. Above all, they heard rumours of a new kingdom which the Christians were to establish, of confidently expressed hopes that the kingdom would soon come, and of openly asserted resolutions and prophecies that it would be established on the ruins of Rome itself. And, on the side of the Christians, Tertullian was ready to boast that in a few years the Christian empire had more extensive boundaries than the Roman, and that Christian soldiers had penetrated and triumphed in regions where the Roman arms were unknown or defied. Christian martyrs marching to the arena confidently predicted the speedy overthrow of the cruel paganism which sent them there. As the struggle deepened, too, there entered a distinctly new element on the Christian side, and the contest became not merely one of the true religion against a false paganism and a pagan and persecuting state; it became a battle between two kingdoms. The Christian bishop and the Roman governor were two rival authorities, viceroys in two warring empires; and the saints would inherit the earth, when the church ruled instead of Rome as the mistress of the world. During the long struggle between Rome and Christianity we see this subtle influence entering into and withering the true spiritual conception of the kingdom of God, until at last it is almost transformed into an earthly empire. St Augustine has seized on and represented this idea with sublime dramatic power in his

Civitas Dei in peregrinatione per terras, where the *Civitas Dei*, or the church, is set over against the *Civitas Terrena*, or state; and where the kingdom of God, however grandly pictured, is almost as material, earthly, and sensible as the empire of pagan Rome. From this fatal influence have come all the attempts to realize the universality and catholicity of the church in a purely external or visible way, and the failure to understand how Christianity may be all-embracing without *visibly* covering and controlling the earth.

In her contest with Rome Christianity succeeded in realizing and giving expression to her claim to universal dominion, but in Rome's overthrow she inflicted an almost fatal wound on herself when she was unconsciously induced to take the government of a pagan empire as her model for the organization of a spiritual kingdom.

In the contest which Christianity had to maintain with pagan philosophy the early Christians were compelled to work out another side of the great problem which confronted the early church—the relation of the Old Testament to the New Testament kingdom of God. Philosophy when engaged upon topics which belong to Christianity is always easily distinguished by the way in which it puts its questions. The question with philosophy, for example, is, What is Sin? How can its existence be explained? But the Christian question is: How can I get rid of sin? To the philosopher sin is food for meditation, but to the Christian it is something to be escaped from. Outside Christianity there were many schools of thinkers who busied themselves with speculations about the origin and nature of sin, death, God, judgment, holiness, and so on, and there were many philosophers who were quite willing to take help from the Hebrew Scriptures in their difficulties. It was always a matter of earnest endeavour on the part of Christian theologians to make it clear that Christianity was not a philosophy to be discussed but a life to be lived; but when they were called, by the views of some of the Gnostics, to explain their relation to the Old Testament Scriptures and to the New Testament canon, we find them unable to realize the full significance of the problem. To the early Christians the Old Testament was pre-eminently the scripture, it was in their possession before the New Testament, and the New Testament canon was gradually formed as one after another of the writings which compose it were found worthy of a place beside the Old Testament Scriptures. Certain of the Gnostic sects made use of the facts, statements, and truths contained in the Scriptures in their theories of creation and redemption, of man, sin, and salvation; and Christian theologians were compelled to refute the Gnostics by setting forth over against the false doctrines what they held to be the truths concerning the matters taught. In this way and gradually there grew up an intellectual system of Christian truth, embodied in the creeds of the church and in the writings of her theologians. The necessity was laid upon Christian theologians to present Christianity intellectually in this way, and oppose a true to the false *γῶσις*; but just as in her contest with Judaism and Rome Christianity insensibly adopted part of the error contended against, so here the struggle against intellectual evil had the result of tending to dissociate Christian life from the Holy Scriptures, and of creating two kingdoms of God—one of life which was to be lived on the lines of the old Roman empire, and one of doctrine which was to be based on the foundations of Greek philosophy. This latter tendency did not appear in the church until the early Jewish element had almost died out. To the Jew Judaism was an historical past which it was not to the Gentile, who could with difficulty think of the church of the Old Testament as a spiritual organization into which he was actually brought by regeneration. To

The influence of pagan philosophy.

the Jew the Mosaic Law and the Old Testament Scriptures generally did not so much mean a series of commandments or prescriptions as a mode of life. No doubt when they thought of the Old Testament their minds were full of laws and commandments, but still the most prominent idea was that their fathers had *lived* and had been enjoined to live a particular mode of life. To the Jew the Old Testament was the past covenant life of his fathers in which he might share, and it showed him God much more as the covenant God with whom Israel had lived in communion than as a mere Lawgiver. But it was more difficult for the Gentile to feel this. He could not easily feel that the covenant life described in the Old Testament was the life into which Christ had brought him, and he felt as much outside of it as the Jew felt within it. And so to him the Old Testament was not so much a haven of religious fellowship as a series of commandments which he might understand and at least could obey. When the Gnostics drew false inferences from statements in the Old Testament, and when the church theologians corrected these in creeds, this forced making of creeds intensified the tendency to look at the Bible—Old Testament and New Testament—rather as a storehouse of theological weapons, than as the medium of personal intercourse between a covenant God and His people. One of the main characteristics of the Biblical idea of the kingdom of God was lost—the thought of personal intercourse with the King through His word realized in an act of personal trust, and the idea of faith lost its sense of trust with personal communion and took the character of assent to intellectual truths. But as the life can never be fed upon abstract truths and their comprehension, and must have some support, Christian life became gradually divorced from any relation to the Word, and became rooted on a system of observances, of which the sacrament of the Supper became the centre. The efforts of the church to realize its relation to the Scriptures were in this way partly successful, because it recognized its duty to set forth the truth of God; but from the way taken the result was to displace Christianity from its position of rest upon the Old Testament church and the Scriptures, and to send it to its own machinery for life and strength.

The influence of
pietism.

One other phase of early Christianity ought to be referred to, as it illustrates another side of the same great problem which was presented for solution. Both in the Old Testament and in the New Testament conceptions of the kingdom of heaven the idea of a new life, or at least of a separate consecrated life, is a conspicuous element. The kingdom of God implies that those who are within the kingdom live a life different from those without. In all ages of Christianity this new and separate life has been an object of speculation, and many various ideas of its true nature have been promulgated. The very conception of a life which is new is sufficient of itself to produce strange conjectures respecting its nature, and in the epistles of St Paul we find evidence that many of the Gentile Christians were disposed to think of the new life of Christianity as one entirely outside of the realm of ordinary moral law. This lawless or immoral tendency was sternly checked in the Christian church, and only gained head in sects outside of it; but traces of the tendency were not infrequent. The function of the Holy Spirit in the church was always made a ground of conjecture concerning the real nature of the new Christian life, and it was from mistaken views of the character of the Spirit's influence and work that disturbing pietist theories perplexed early Christianity. These pietist theories gained distinctive form and acquired great power in what has been called Montanism, and the church's efforts to rid herself of this incubus, while well intentioned, led to permanent results by no means satisfactory. One of

the chief characteristics of this early pietism was the idea that the abiding presence of the Holy Spirit rendered possible a continuous revelation, and it was believed that the prophetic gift was permanent in the Church. The Montanist prophets presumed to add to revelation, and to overturn ecclesiastical laws and jurisdiction by means of infallible utterances disclosed to them. The practical effect would have been to reduce the organization of Christianity and the intercourse between Christians to a precarious dependence upon the dictates of self-constituted prophets, whose ideas of revelation resembled the heathen soothsaying much more closely than the Old Testament prophecy or the New Testament inspiration, and this led the church to adopt a severer discipline and more monarchical constitution. But this must be afterwards referred to.

To sum up, then, early Christianity, in working out the problem of its connection with Judaism and the Old Testament Scriptures, achieved success in four great directions, but at the same time made four great mistakes. It insisted rightly on the fact that in order to be a development of Judaism Christians did not require to become Jews first, but it erred in attempting to make Christianity the exact counterpart and rival of Judaism. It insisted rightly that the kingdom of heaven was a kingdom to be set up on earth and so all-embracing as to include the whole earth within its boundaries, but it erred when it conceived it to be a kingdom which in any way could be compared with the Roman empire, and when it began to translate spiritual power and possession into physical and temporal dominion. It insisted, rightly, that the church was the custodian of truth, but it erred when it made faith intellectual assent, when it gave to the Bible an entirely intellectual aspect, and laid the foundations for infallible creeds. It rightly expelled from its midst a false pietist prophecy, which in course of time would have undermined alike scriptural and ecclesiastical authority, but it erred when it conferred on a consecrated privileged caste the sole authority to interpret scripture and regulate ecclesiastical discipline. These attempts and failures in early Christianity have been so often repeated that they may be looked upon as true and false principles of development inherent in it.

The history of the world presents no phenomenon so striking as the rise and early progress of Christianity. Originating in a country not remarkable for any political, commercial, or literary influence, emanating from One who occupied a humble sphere in the community amidst which He appeared, and announced in the first instance by men of mean extraction, of no literary culture, and not endowed with any surpassing gifts of intellect,—it nevertheless spread so rapidly that in an incredibly short period of time it had been diffused throughout the whole civilized world, and in the fourth century of its existence became the recognized and established religion of the Roman empire. When it is remembered that this result was achieved not only without the aid of any worldly influence, but in the face of the keenest opposition on the part of all the learning, wealth, wit, and power of the most enlightened and mightiest nations of the earth, the conclusion is strongly forced upon us that a power beyond that of man was concerned in its success, and that its early and unexampled triumphs afford an incontestable proof of its inherent truth and its divine origin. Nor has the rapid advance of Christianity been confined to its earlier years. "After a revolution of fourteen or fifteen centuries that religion is still professed by the nations of Europe, the most distinguished portion of human kind in art and learning as well as in arms. By the industry and zeal of Europeans, it has been widely diffused to the most distant shores of Asia and Africa, and by means of their colonies has been firmly established from Canada to Chili in a land unknown to the ancients."

Early progress of
Christianity.

And when we turn to the results of modern missionary enterprise we find a success no less remarkable.

Causes of
its pro-
gress.

Historical critics who have no sympathy with the supernatural elements in Christianity have attempted to account for this wonderful success by natural causes, and have pointed out various circumstances which go far to account for the rapidity of its spread. Sceptical critics of a past generation contented themselves with enumerating various distinct causes combining to produce the effect, while naturalist writers of our own day try rather to show that Christianity was the natural outcome of the intellect of the age which produced it. The great disadvantage attaching to the one mode of criticism is that no parade of causes or conditions of success can ever get rid of the supernatural character of Christianity, for it is always impossible to show that these are the only causes at work, and the retort can be made that these causes are themselves part of the supernatural plan for the introduction and furtherance of Christianity, while the other labours under the necessity either of getting rid of the Christ of history and putting in his place an elaborate poem—an attempt not yet successful—or of reducing the character and work of Jesus to the level of those of Confucius, Buddha, Mahomet, or other founder of a purely naturalist religion. The celebrated five causes of Gibbon are perhaps the best specimen of the one mode of argument, while the elaborate theories of the Tübingen school are certainly the most noteworthy instance of the other. Gibbon thinks that the Christian faith obtained so remarkable a victory over the established religions of the earth because it was effectually favoured and assisted by the five following causes:—1. The inflexible, and if we may use the expression, the intolerant zeal of the Christians, derived it is true from the Jewish religion, but purified from the narrow and unsocial spirit, which instead of inviting had deterred the Gentiles from embracing the law of Moses; 2. The doctrine of a future life improved by every additional circumstance which could give weight and efficacy to that important truth; 3. The miraculous powers ascribed to the primitive church; 4. The pure and austere morals of the Christians; 5. The union and discipline of the Christian republic, which gradually formed an independent and increasing state in the heart of the Roman empire. It does not need the possession of an anti-Christian spirit to admit that these causes of Gibbon's may have helped greatly to spread the Christian religion, and indeed the Christian critic has to object not so much to this statement of causes as to the covert insinuation which lurks in the historian's exposition of their influence. For the question still remains to be put, why was it that Christianity possessed so many characteristics which made it adapted as no other religion was to the needs and capacities of mankind. Still it ought to be observed that when we turn to the pages of the early Christian Apologists, especially to the writings of those of them who were converted to Christianity after having spent many years as intelligent pagans, we find them almost unanimous in declaring that they themselves were attracted to Christianity chiefly by these three reasons:—1. The sublimity and simplicity of the Christian doctrines of God, sin, and salvation; 2. The noble purity of the Christian life, more especially of the life of a Christian woman; and 3. The grandeur of the doctrine of creation contained in the Old Testament Scriptures. The inefficiency of the theories of modern critics who would explain the origin and success of Christianity on purely naturalist grounds has already been discussed under the head of APOLOGETICS.

The influ-
ence of
Chris-
tianity.

The strong and deep influence which Christianity soon began to have even over the lives and opinions of those who were not Christians, is even a more striking testimony to its paramount claims than the rapidity of its spread.

The struggle of Christianity with Rome has already been alluded to, but even before Rome gave up the struggle in despair, before the last persecution, and before the triumph under Constantine, the influence of Christianity was making itself felt morally, socially, and politically, while its influence on intellect and science was no less remarkable.

It is almost impossible for us to realize how powerfully Pagan immorality acted upon the general morality of the great peoples of antiquity and encouraged all manner of lawlessness and indecency. In the time of the later republic and of the early empire we have the spectacle of Roman law and philosophy powerless to restrain the brutal and obscene passions of the people excited by the influence of the popular religion, even when they had ceased to regard it as an intelligible creed. All paganism is at bottom a worship of Nature in some form or other, and in all pagan religions the deepest and most awe-inspiring attribute of nature was its power of reproduction. The mystery of birth and becoming was the deepest mystery of nature; it lay at the root of all thoughtful paganism and appeared in various forms, some of a more innocent, others of a most debasing type. To ancient pagan thinkers, as well as to modern men of science, the key to the hidden secret of the origin and preservation of the universe lay in the mystery of sex. Two energies or agents, one an active and generative, the other a feminine, passive, or susceptible one, were everywhere thought to combine for creative purpose, and heaven and earth, sun and moon, day and night, were believed to co-operate to the production of being. Upon some such basis as this rested almost all the polytheistic worship of the old civilization, and to it may be traced back, stage by stage, the separation of divinity into male and female gods, the deification of distinct powers of nature, and the idealization of man's own faculties, desires, and lusts, where every power of his understanding was embodied as an object of adoration, and every impulse of his will became an incarnation of deity. But in each and every form of polytheism we find the slime-track of the deification of sex; "there is not a single one of the ancient religions which has not consecrated by some ceremonial rite even the grossest forms of sensual indulgence, while many of them actually elevated prostitution into a solemn service of religion." The corrupting influence of paganism entered into the very essence of the social life of the Roman at the time when Christianity began its career. The thoughtful reader of contemporary literature cannot fail to observe how day by day the poison instilled itself into every nook and cranny of the social life of the people. "It met him in every incident of life, in business, in pleasure, in literature, in politics, in arms, in the theatres, in the streets, in the baths, at the games, in the decorations of his house, in the ornaments and service of his table, in the very conditions of the weather and the physical phenomena of nature. It is not easy to call up as a reality the intending sinner addressing to the deified vice which he contemplates a prayer for the success of his design; the adulteress imploring of Venus the favours of her paramour; the harlot praying for an increase of her sinful gains; the pander begging the protection of the goddess on her shameful trade; the thief praying to Hermes Dolios for aid in his enterprizes, or offering up to him the first-fruits of his plunder; young maidens dedicating their girdles to Athene Apaturia; youths entreating Hercules to expedite the death of a rich uncle. And yet these things and far worse than these meet us over and over again in every writer who has left a picture of Roman manners in the later republic and under the beginning of the empire" (*North Brit. Rev.*, vol. 47). When we turn to the writings of the early Christian Apologists we find them exposing in a scathing way this whole state of

The social
influence of
Christi-
anity.

things and contrasting it with that moral law which is written by nature on the heart of men; and the pure lives of the Christians in the midst of this sea of iniquity had a wonderful effect. There is no contrast more wonderful than that which may be drawn between the grandeur of Roman law and the debasement of the ordinary social life of the Roman people; but Roman law was founded much more on economic than on moral foundations. But when Christianity entered into the Roman empire, and when it at last had made head against paganism, the imperial law found an ally in Christian ethics which it had been without during the reign of paganism, and discovered, too, a higher sanction for its precepts than mere economic interests. From the time of Constantine onwards the influence of Christianity on Roman law is remarkable, and always on the side of morality in the highest sense of the term. We find from the Acts of the Apostles that the first organization of Christians was for the better distribution of charity to those in need of it, and one of the earliest results of the political triumph of Christianity in the empire was the promulgation of laws ensuring the protection of the feeble and the helpless. The nineteen years of civil war which preceded the final victory of Constantine had produced the usual scenes of misery, and great numbers of orphan children were thrown upon the world without protection. The influence of the celebrated Lactantius, to whose care Constantine had committed the education of his son Crispus, was able to secure the publication of a law declaring that the emperor was the father of all these children, and that the expense of their upbringing was to be defrayed by the state. At the same time the exposure for sale of unfortunate children was sternly forbidden, and those who so exposed them were condemned to the amphitheatre. The condition of slaves was also greatly ameliorated by the new spirit of Christianity which was then working in society. Slavery was not abolished, but various laws were made restricting the power of slave-holders. The master was deprived of the arbitrary power of life and death. It was ordained that when royal estates were divided the families of slaves of the soil were not to be separated. New laws breathing a more Christian spirit regulated the relation of the sexes. Divorce was made a much more difficult matter. The laws against rape and seduction were made more severe, and adultery became a capital offence. The nameless crime, which was the disgrace of Greek and Roman civilization, was made punishable by death. The making of eunuchs was forbidden, and it was enacted that slaves who had suffered this mutilation might claim their freedom. But the silent revolution which Christianity wrought in social morality cannot be measured by legislation. It is to be traced in a purer literature, a higher moral life, a better public spirit, and, above all, in the establishment of buildings for the reception of strangers (*ξενώρες*), alms-houses for the poor (*πρωχρηστοφιλία*), hospitals and orphan-houses for the sick and the forsaken, and houses of refuge for the support of helpless old men and women. All these were due to the church, and the bishops vied with each other in the proper exercise of a munificent charity. One of the most celebrated of these establishments was the Basilias of Basil of Caesarea, where strangers were hospitably entertained, and medical attendance and nursing were provided for those sick of whatever disease. In the Basilias everything was on the most magnificent scale. The physicians of the establishment resided within the walls, and workshops were provided for all the artisans and labourers whose services were needed. The presence of such institutions, and the Christian charity to which they bore witness, must have had a wonderfully restorative influence on the corrupt pagan society in which they were set up. Law and religion became allied, not opposing forces.

The political influence of Christianity is as marked as its moral power, and had as great an effect upon the paganism into which it was thrown. It was Christianity which gave to the world those two great factors in civil liberty,—a consolidated public opinion and an efficient system of representative government. Gibbon has gone out of his way to sneer at the passive resistance of the early Christians, and has lent the weight of his authority to the idea that a struggle for civil liberty is opposed to the whole tenets of primitive Christianity; but whatever the views of the Christians were on these points, it is plain that Christianity put a new public life into the Roman empire which greatly retarded its final fall. It has been frequently remarked that Christianity did as much for Constantine as he did for it, and the history of the time amply justifies the observation. Whatever be the truth about the sincerity of his conversion, it is undoubted that he, from first to last, looked at the church from a political point of view, and made use of it accordingly for his own political aggrandizement. It should be remembered that the Roman empire hung badly together, and that apart from the sentiment which may be called belief in the genius of Rome there was no common life and no common nationality. There was no popular life, such as we are accustomed to in modern Europe. From the beginning the empire had been a military tyranny. The emperor was imperator, and ruled because he commanded the state as an army, and the rule in the provinces was really military. It was imposed on the people from without and did not spring from themselves. There was not even that solidarity in it which an hereditary absolutism begets. Of course such an empire had very little cohesion, and was only kept together by the feeling of the genius of Rome and by the grand system of Roman law. But there was within the empire a new corporate life, a new kingdom, which subsisted in virtue of the life which was in it, held together by the inward power of growth. When Constantine and Constantine looked at the Christian church with the eyes of statesmen, they saw before them a great self-regulating organization which had a common life, a cohesion, and a corporate character quite unlike anything else in the empire. It was impossible to touch the church anywhere without the whole body being thrilled throughout from end to end, so thoroughly was it one. If the emperor could bring any influence to bear on the Christian organization, he might hope to move these hidden spiritual springs of action which are so much more powerful than anything lying at the command of a mere military government. The organization of Christianity was such that all over the empire and beyond it there was, without undue centralization, a confederation of local churches whose government was thoroughly democratic and based on the principle of representation by means of office-bearers elected by the people, which produced a unity of sympathy and action. Besides all this the common life was kept up by active sympathy between the various churches. If there was a famine in Africa, the churches in Spain and Gaul sent grain. If Christian Gauls had been carried off into captivity by the pagan Germans, the wealthy African and Roman churches sent money for their redemption. The military roads, the system of posts, the relays of ships which Rome kept up to bring intelligence and produce from the provinces, were all used by the church for the purpose of keeping up a lively communication between all the various parts of the Christian world. In this way Christianity within the empire was the one organization for creating, stimulating, and guiding public opinion. It was that one part of the Roman empire which, scattered over all its extent, had common feelings and all those various common instincts which go to make up a commonwealth. This was the force that Constantine sought to put himself at the head

of, and because he succeeded he was the first Roman emperor who ruled with something like what we should call "public opinion" at his back. The victory of Constantine was the first instance of the triumph of that mysterious popular force which has given organized freedom to the civilized nations of Europe, and which is equally removed from the civic freedom of the ancient democracy and from the military tyranny of the great empires of antiquity. It is to Christianity that modern Europe owes organized public opinion and representative government.

Christi-
anity and
science.

The silent influence which Christianity has exercised upon the human intellect, and especially upon its scientific researches, is too important to be passed over. Anti-Christian writers have combined to show the hostility which they think exists between religion and science, and have painted in glowing colours the hindrances which Christianity places before the advance of scientific ideas; but such attempts resemble the efforts of a man to kick down the ladder which has enabled him to reach the elevation on which he stands. Christianity did not create philosophy nor science, and many of the earlier Christian theologians denounced in no measured terms the philosophies of Greece and Rome because of their connection with paganism, while philosophy on its side was the last remnant of the old pagan civilization which withstood the Christian conquest. Soon, however, philosophy and Christianity came to terms, and in the writings of St Augustine we find the noblest Platonism allied with the loftiest Christian theology. The science of paganism has never been on a par with its philosophical speculations, and whether we examine the ancient civilizations of Greece and Rome which have passed away, or those of India and China which remain, we seek in vain science and scientific knowledge in the modern sense of the term. The truth seems to be that science requires to build on a foundation supplied by Christianity, and which paganism is unable to furnish, or at least has never yet furnished. Science presupposes and rests on the idea of the oneness and uniformity of the universe, and this idea is, strictly speaking, a Christian conception. Aristotle, the most scientific of the ancients, was unable to conceive the uniformity of nature or the totality of things in anything like the sense which these phrases have to modern thinkers. His conceptions of matter and form, of potentiality and actuality, and so on, implied a subtle duality which effectually stood in the way of such a thought. The uniformity of nature, the capacity of the ideal to realize itself in actual things, was always apt to be thwarted by an inward stubbornness of matter which declined on occasions to submit itself to law. It was this idea which stood in the way of the modern thoughts of the uniformity of nature and of the totality of things which are so essential to science. But such a stubborn, formless matter as pagan philosophy and science delighted to speculate about was quite foreign to Christian speculation and was opposed to the deepest instincts of the Christian life—of trust in the Father who is in Heaven. Christianity did not propose to itself the solution or even the statement of scientific problems, but its yearning to get near God enabled it to see deeper into the problem of the basis of science than the whole of pagan thought had been able to do. The Christian doctrine of creation and the Christian doctrine of providence furnish the foundations on which modern science rests. The Christian doctrine of creation states the absolute dependence of all things on God. He made them out of nothing; and the religious nerve of the doctrine consists in the feeling of absolute dependence on God which this implies. We and all things have our birth and being from God, and from nothing else. Practically God is all in all to us, for on Him all things depend for their origin, and they depend on Him alone. The Christian doctrine of

providence presents the same thought in another form. The nerve of this doctrine is that God can and does make all things work together for the good of His people. Here again is the idea of the absolute dependence of all things on God, not merely for their origin but also for their existence and endurance. In this way the thought of God as the creator and preserver of all things gives a complete unity to the universe which pagan thought never reached, and gave that basis for the thought of the uniformity of nature which science demands. It was long ere Christianity could force this thought on the human intelligence, but until it had permeated the whole round of man's intellectual work it was vain to look for advances in science. It was the task of the scholastic theology and philosophy to knead into human thought Christian ideas, and among the rest this idea of the unity and uniformity of nature. Anti-Christian critics have spoken of the deadness and uselessness of scholasticism, but its value for science and scientific inquiry can scarcely be over-estimated; for it was scholasticism which worked Christianity into every department of human and intellectual activity, and so leavened them with it, that when its work was done, the intelligence of man was so thoroughly saturated with the Christian view of nature that it could never again forget it. When scholasticism had accomplished its task modern science sprang into being dependent for its very foundation on that Christianity to which it is supposed to be so bitterly hostile.

The organization of Christianity belongs more properly to the description of the church, but it is impossible to pass the subject without any allusion. Christianity, which has been described to be a new life which takes an organic form and grows like other living things, cannot help taking to itself an external form or organization which approaches perfection in the proportion in which it is adapted to express the life which it contains. On the one hand, the external form of Christianity must not be confounded with Christianity itself, and on the other it must be remembered that Christianity does, and must from its very nature, embody itself in an external organization. And a two-fold danger arises from the neglect of this principle, when on the one hand the machinery of Christian worship and discipline is mistaken for Christianity itself, and when on the other it is mischievously imagined that the purity of Christianity depends on the realization of an impossible invisibility or absence of organization.

All the various modes of Christian organization or church government profess to imitate the apostolic model, and to be founded on and agreeable to the New Testament Scriptures, and the comparative scantiness of information therein supplied has led to violent controversies upon the subject into which we need not now enter. Many have supposed with great probability that the New Testament contains so few positive instructions on this subject, because the apostles did not invent a new organization for Christianity, but simply took over from Judaism that organization for worship and discipline which had no connection with the temple service—the synagogue system—and that the early Christian worship was simply a reproduction of the synagogue service. We may at all events believe that the early Christian organization, if not exactly the same, was modelled upon that of the synagogue, and that the reason why we have so few descriptions and instructions in the New Testament is that the apostles did not require to describe what was so very well known to the Jewish Christians who composed the apostolic church. At first the Christians seem to have shared in the common worship of the Jews and to have engaged at the same time in services which were peculiarly Christian (Acts ii. 46), and in this way they appeared to be and were called

tian com-
munity.

The
gogue
system.

a sect (*αἵρεσις*) of the Jews. They do not seem to have had any ecclesiastical organization distinctive enough to separate them from the Jews. Founding on these and other facts Vitranga has derived the whole of the Christian machinery of worship and discipline from the Jewish synagogue. But this is going too far. Two influences, so far as we can gather, seem to have combined to modify the early state of matters which we see existing in the first chapters of the Acts of the Apostles, and these were the hatred of the Jews and the entrance of Gentile Christians. These two circumstances led to the introduction of a new church organization distinct from the Jewish and more suited to the requirements of Christianity. This early Christian organization, whose growth can be obscurely traced in the New Testament, is characterized by two special features. It was evidently founded on and in many respects analogous to the Jewish religious community, and the constitution was thoroughly democratic.

When Christianity arose, Palestine, and indeed the whole of the civilized world where Jews had penetrated and settled, was covered with a network of synagogues in constant correspondence with each other. The synagogue system was an organization for public worship, but also had to do with the lives and conduct of the worshippers, and possessed quasi-judicial functions. The worship of the synagogue was not sacrificial, like that of the temple. It was simply devotional, consisting in prayer, praise, reading, and preaching, and was regulated by a fixed liturgy. The synagogues were ruled by a variety of office-bearers. In the first place, there was commonly a college of elders, with the chief of the synagogue at their head. These elders had a variety of names—almost all of the designations given in the New Testament to the Christian office-bearers are used to denote these Jewish *Z'Kenim*. These elders were the real rulers; they had the power of excommunication, and superintended the worship and charities of the synagogue. Besides these elders there was an officiating minister who was the delegate of the congregation; the rules which Paul laid down to be observed in the choice of a bishop almost exactly correspond to the conditions to be satisfied in the election of the *Sheliaeh*. The lowest class of office-bearers were the ordained servants or ministers of the synagogue, who are sometimes called the young men, and who like the *Sheliaeh* and the *Z'Kenim* were ordained by laying on of hands. In this synagogue system, with its simple devotional worship, its office-bearers to preserve discipline and encourage the exercise of charity, the early Christians found an organization ready to hand which they could at once take advantage of and either adopt or at least copy in important details.

All throughout the New Testament we are reminded that the office-bearers exist for the community and not the community for the office-bearers, and this truth is enforced with emphasis when the diversity of office in the Christian church is made to depend upon diversity of gifts (Eph. iv. 4-16), and upon the appreciation of those gifts by the Christian community testified to in the process of election.

We get these two primary ideas therefore about the early Christian community, that possession of office meant the possession of gifts suitable for the edification of the community, and the recognition of this fact by the people. In the New Testament the ordinary office-bearers in the Christian community have a variety of designations. They are called *προϊστάμενοι*, *πρεσβύτεροι*, *ἐπίσκοποι*, *ποιμένες*, and *ἡγούμενοι*; but all these names are used evidently to express the same kind of officers, for they are continually used interchangeably the one for the other. In the earlier times of Christianity the service was probably very simple, and the meetings were held in the houses of the first converts or of the officers of the little Christian

community. In an old liturgy we find a rubric enjoining the deacons to order all mothers to take up their infants at a peculiarly solemn part of the worship, which shows us a picture of an early Christian assembly with the babies crawling peacefully over the floor during the greater part of the service.

Many controversies have arisen about the relation of these office-bearers to the community on the one hand, and to the apostles on the other. As the New Testament writings do not give us more than passing allusions to the mode in which the government of the Christian community was carried on, and describe it in action rather than give a detailed account of the principles on which it was founded and the way to apply them in practice, we may be expected to find there descriptions of the Christian organization at various stages of early development. Some have believed, not without great probability, that we have in the account of the choice and consecration of the seven men (Acts vi. 1-6) the beginning of the Christian organization on a distinct and separate basis of its own, and that these seven men were the first regularly chosen office-bearers in the early Christian community. These seven men were chosen to take charge of the charities of the small Christian community, and it is not difficult to see now from this how they came to rule the community. We find no trace of a distinct and separate election of elders or pastors; and it is worthy of note that the special service to which these men were appointed, viz., to take charge of the poor, is the work which we find the elders engaged in on the first occasion on which they are mentioned (Acts xi. 29-30). Habitual almsgiving was regarded as a religious service of no ordinary significance, and was specially enjoined on all true believers, and the men appointed to take charge of this must have held a very high position in the church. It is evident, besides, that the superintendence of the charities involved a certain amount of disciplinary control, and so the other duties of the office-bearers in the Christian church naturally clustered around this one. The recipients of charity were to be suitable persons (1 Thess. v. 12-15, 1 Tim. v. 9-16); and we can easily see how gradually the benevolent oversight passed over into the rule of discipline, until men originally elected to regulate the benevolence of the community became the rulers of the church.

But whatever the earliest office-bearers were, and however they were chosen, it seems evident that their special function was to rule or to exercise discipline rather than to teach. In the apostolic church there seem to have been two kinds of teaching recognized, the apostolic announcement of the evangel and the preaching of the word. The latter was evidently at first open to all and sundry who had or who thought that they had the gift, and the only restriction placed upon indiscriminate exhortation was the command forbidding women to speak in public. The gift of preaching or exhortation was looked upon as a gift of the Spirit independent of office; and the earliest office-bearers were men who ruled rather than men who taught. Open preaching continued for a long time in the post-apostolic church, and is distinctly recognized in the so-called Apostolic Constitutions; but there are evidences in the New Testament that the practice had its inconveniences and was discouraged by the apostles. James warns heedless preachers that they take great responsibility upon them, and shall receive the greater condemnation (Jas. iii. 1), and Paul in several passages takes notice of the irregularities and unedifying confusion attending the practice. Hence we find the function of instruction at an early period engrafted on that of rule, just as the function of rule had grown out of that of oversight of the distribution of charity; and one of the special qualifications of elders of the church was aptness to teach. In the

Epistles to Timothy we even find traces of a plan for giving a special education and training to young men who were set apart to prepare themselves for the office of elders who were to teach. In the post-apostolic Church we find another office quite distinct from the eldership, the office of deacon. The deacons in the post-apostolic church were officers who waited upon the bishop, and many have thought that the election of the seven men was really the election not of elders but of deacons; but there seems no reason to suppose this. The real warrant for the existence of the diaconate consists in the fact that the office and duties of the deacon correspond very nearly to those of the "ministers" of the synagogue, and also in the many scattered references in the New Testament to the existence of "young men" (one of the technical terms for the synagogue deacons), who waited upon the apostles. To sum up then, the office-bearers in the early Christian community were men selected by the voice of the congregation, and confirmed by the apostles, to administer the charities of the community; and to this primitive function there was added soon after the duty of oversight, leadership, or rule, and somewhat later the duty of providing for the proper teaching of the people.

The
apostles.

The relation of the apostles to these office-bearers and to the Christian community is a problem not without difficulties. Apostle primarily denotes one who is sent on a special mission, and in the Septuagint is used to translate the Hebrew *Shaluach*, meaning one who has a special commandment from God. The word was in common use among the Jews to denote a special messenger and more especially messengers sent on foreign missions. Thus the Jews who were sent from Palestine to stir up the foreign synagogues against the Christians are called apostles. All these ideas help to show us what the Christian apostles were. It should be remembered, however, that the term apostle is used in its Christian sense in two ways at least, in a wider and in a narrower sense. In the narrower and more strictly technical sense the apostles were the eleven whom Christ chose to be special witnesses for Him because they had been with Him from the beginning, together with Matthias, selected by the apostles to fill the place of Judas before the descent of the Holy Spirit, or as some with more probability think, Paul, who was selected for this place by Christ Himself. On the other hand, many others are called apostles who did not belong to this company,—Barnabas, for example (Acts xiv. 14), Andronicus and Junias (Rom. xvi. 7), and others (2 Cor. viii. 23; Phil. ii. 25). This vagueness in the New Testament use of the term makes it somewhat difficult to speak with anything like precision of the relation in which the apostles stood to the office-bearers and members of the early Christian community. But one or two statements enable us to see what were the functions of the apostles strictly so called. It is said, for example, that Christians are built upon the foundation of the apostles and prophets, Jesus Christ Himself being the chief corner-stone (Eph. ii. 20), and the capacity of the apostles to act in this way as a foundation is explained by passages which seem to say that the qualifications for apostleship were—to have been with the Lord from the beginning, to have seen and recognized Christ after the resurrection, to have been witnesses of the ascension, and to have been gifted with peculiar spiritual gifts. And we may say generally, that just as the prophets of the Old Testament were the links between their own generation by their speech, and between future generations by their writings, and the Saviour that was to come, so the apostles were the links between the first generation of Christians by their presence and influence, and between all succeeding generations of Christians by their writings, and the Saviour who had come. They were to serve as the connection between the first generation of Christians and Jesus, and were to have

no successors but the writings of the New Testament canon, which has taken their place and done their work for all succeeding generations.

The relation of the apostles, therefore, to the primitive church was altogether unique, as indeed is implied in their name; and when they act or give official advice apart from their apostolic office, which they did in certain cases, they do so as elders chosen to act along with the other elders who did not possess apostolic gifts. If these views are correct the autonomy of the early Christian communities was complete during the lifetime of the apostles, and was quite independent of the apostolic office and authority.

This thought has an important bearing on the history of the growth of the Christian government. In the 5th and 6th centuries we find that the government was episcopal, and that the principles on which it rested were very different from those which lay at the basis of the government of the Christian community during the apostolic times. The identity of the terms bishop and presbyter within the apostolic church is now so universally admitted by scholars that the sole question really is, When did bishops begin to exist as separate and superior officers? and the dispute becomes one of historical facts rather than dogmatic theories. According to one account the episcopate became the form of the government about the year 70 A.D., to meet and supply in a legitimate way a want which, if not supplied, might have caused the ruin of Christianity; and according to another and more probable theory, the episcopate in the strict sense of the word was not established until the 3d or 4th century. It arose during a panic, and was really a false development of the primitive government, and sanctioned neither by scripture nor by the necessities of the times. Of course the discussion is very much mixed up with the question whether the apostolic office was or was not a permanent one in the Christian church.

According to the one theory, the year 70 A.D. may be taken as the turning point. In that year Jerusalem was destroyed and the Jewish church of Jerusalem rudely shaken, and by this time John only of the apostles remained alive, and he had already left Jerusalem. It was at this time, according to several scholars, that the episcopate arose to take the place of the apostolate and preserve the church from breaking up into several small sects when no longer governed by the apostles and not yet in full possession of the New Testament canon. Apart from the historical evidence to be urged in support of this theory, its chief strength lies in the mere assumption that the presbyterian rule of the apostolic church was unfit to carry on the government when unsupported by the authority of the apostles, and had to be supplemented by an episcopate. When examined, the historical proofs for this state of affairs are not very satisfactory. We certainly soon find men who are called bishops distinct from the other elders, and are superior to them; but the name and the duties which belong to them appear to be not so much those which pertain to a bishop in the episcopal sense of the term, but rather those which are performed by a minister or preaching elder in the modern Presbyterian organization. In the early church the first convert, the best speaker, he whom the apostle had made his friend during his brief stay, would naturally be elected to preside at the meetings of the college of the elders who ruled the affairs of the community, and to represent it at conferences with other communities, and would naturally be invested with the name which denoted special oversight. And the extension of the church would naturally involve a further development of this process. When one church became too small, another was built, and a presbyter sent from the first congregation to work there under the superintendence of his bishop, and so on until the minister of

Montanism
and the
Episcopate.

presiding elder of the earliest planted or mother church became the perpetual president or overseer of various dependent congregations. But this is very different from the theory which afterwards became dominant in the church, and fails to account for the origin and almost universal supremacy of episcopacy. Perhaps of all the accounts which have been given of its origin, that which connects it with the disturbances engendered by Montanism is the most satisfactory. While the church was governed in the manner described above, a wave of religious excitement passed over it, connected doubtless in some way with the striking phenomena of Montanism and the new prophecy, and characterized by an overstrained zeal for enforcing discipline in all cases of departure from a high standard of Christian life. It was the peculiar characteristic of Montanism to set forward its prophets as successors of the apostles, having the same gifts from the Holy Spirit, and sent on a similar message of instruction to the Christian church. They uttered prophecies which were deemed supplementary to the revelation contained in the Old and New Testaments, and they did not scruple to set aside the authority of the regularly ordained officials of the church in order to execute the behests of a supposed spirit of prophecy. And thus the Christian communities were everywhere burdened by the presence of ignorant intolerant fanatics, who insisted that all their fellows should follow the dictates of their narrow and ignorant conscience, and who backed up this unwarranted interference with Christian liberty and responsibility by claiming to hold the place and exercise the powers of inspired successors to the apostles. It was at this juncture, according to a not improbable theory, that Cyprian of Carthage was able to popularize and gain acceptance for a theory of Christian organization which had been slowly growing up within the church, and which is now known as Episcopacy. Cyprian, bishop of a church which more than any other had suffered from the consequences of Montanist excesses, was the founder of a revolution of a kind which has been frequently repeated in the political world. Montanism and its after wave had influenced in an especial way the minor clergy and the more fanatical laity. Cyprian, like many a succeeding absolutist, seems to have subverted the aristocracy of a presbyterate infected with Montanism by persuading the people to make common cause with the bishop. He promised deliverance from arbitrary and unofficial successors of the apostles by boldly setting forth the episcopate as the true successors of the apostles. He transferred, in all sincerity, to the episcopate all the powers and gifts laid claim to by the Montanist prophets, and at the same time showed the people how easy the yoke of a legitimate monarchy was when compared with the lawless rule of a mob of self-anointed tyrants. From Cyprian's time onwards the whole constitution of the church became changed, and the foundations of what ultimately became Ultramontanism were laid. The episcopate claimed and exercised as part of its official duties all those gifts of rule and special inspiration which the Montanist prophets had laid claim to. The bishops laid claim to powers of rule over the Christian community not as chosen representatives of the Christian people, but as the official representatives of the apostles.

The corrup-
tions of
Chris-
tianity.

It only remains to allude briefly to the corruptions of Christianity. It has been already stated that Christianity had a fourfold conflict to maintain with Judaism, Rome, Gnosticism, and an enthusiastic and sometimes immoral pictism. If we add to these pagan superstitions, we shall have the chief heads of the opposition which Christianity had to encounter. After its triumph these sources of anti-Christian action still remained to be contended against, and became the chief springs of its corruption. The spirit of Judaism, of Roman worldly policy, of pagan supersti-

tion, of pagan philosophy, and of immorality entered into Christianity and tended to corrupt it.

One of the earliest causes of the corruption of Christianity was the attempt to translate the Christian kingdom of God into a visible monarchy in which the saints inherited the earth in a literal way. The Church was the more tempted to enter into this course during the period of the decay of the Roman empire, when civil authority became very weak and the real rulers were in many cases the principal clergy of the place. The consciousness of power inspired a desire for its insignia, and soon the bishop and superior clergy adorned themselves in the official robes of Rome's municipal and provincial officers. This whole tendency received a great impulse during the period that Rome was abandoned by her emperors, and when the chief citizen in the imperial city was undoubtedly the Christian bishop. How all this tended to corrupt Christianity is very apparent. In the first place it generated the idea that the Christian kingdom is a visible monarchy and that its marks are such as can be seen; and it led Christians to postpone everything to the earthly aggrandizement of the church. It translated spiritual forces into mechanical and physicaequivalents. The very term spiritual, which belongs to the affections and emotions and thoughts and will, to the whole inward life, was used to denote whatever belonged to the church or the clergy. Land became spiritual when it passed into the hands of the bishops; men were spiritual if they were servants of the church; things were spiritual if they were church property. There resulted, in short, a gradual coarsening of ideas, and all that was most inward, hidden, and sacred was forgotten in the strife for worldly position and power and wealth. On the other hand, this tendency worked a good deal deeper. Worldly men who found their way into the ministry were tempted to favour any kind of superstitious error that tended to bring them profit and power. The people were often disposed to fancy that the priests could serve God in their stead, and that there were mysteries in religion which the priests understood, but which the laity need not know anything of and ought not to inquire into. Hence they were ready to follow blindly the guidance of the priests in religious matters, just as a man trusts his legal concerns to his lawyer, doing what he directs and not considering it necessary himself to study law. Ambitious and worldly minded rulers, too, are generally glad to make use of religion as an instrument for securing the submission of the people to tyrannical oppression, and for aiding their ambitious views when they seek to subdue their neighbours under the pretext of propagating the true faith. Then again, this idea tends to breed false views of Christian unity. It leads men to think that they cannot be true Christians unless they belong to one community which is visible and universal. And this idea tends to keep up and intensify other errors. For if a man is convinced that all Christians are bound to belong to some one community on earth, he will dread nothing so much as separation from that church, whatever it may be, which he considers as having the best claim to be that one community.

Many corruptions of Christianity have been either introduced or favoured and kept up by moral corruption in the members of a Christian Church. For it belongs to the true gospel to purify and also to elevate the moral character. Hence there is a complete and constant opposition between genuine Christianity and all the evil and base propensities of man's nature. Every kind of depravity or moral defect therefore predisposes men either to reject Christianity altogether, or else to introduce or to accept some erroneous views of it. And there is no kind of religious corruption against which men are usually less on their guard. They are well aware, indeed that there is a danger of men's

Epistles to Timothy we even find traces of a plan for giving a special education and training to young men who were set apart to prepare themselves for the office of elders who were to teach. In the post-apostolic Church we find another office quite distinct from the eldership, the office of deacon. The deacons in the post-apostolic church were officers who waited upon the bishop, and many have thought that the election of the seven men was really the election not of elders but of deacons; but there seems no reason to suppose this. The real warrant for the existence of the diaconate consists in the fact that the office and duties of the deacon correspond very nearly to those of the "ministers" of the synagogue, and also in the many scattered references in the New Testament to the existence of "young men" (one of the technical terms for the synagogue deacons), who waited upon the apostles. To sum up then, the office-bearers in the early Christian community were men selected by the voice of the congregation, and confirmed by the apostles, to administer the charities of the community; and to this primitive function there was added soon after the duty of oversight, leadership, or rule, and somewhat later the duty of providing for the proper teaching of the people.

The
apostles.

The relation of the apostles to these office-bearers and to the Christian community is a problem not without difficulties. Apostle primarily denotes one who is sent on a special mission, and in the Septuagint is used to translate the Hebrew *Shaluach*, meaning one who has a special commandment from God. The word was in common use among the Jews to denote a special messenger and more especially messengers sent on foreign missions. Thus the Jews who were sent from Palestine to stir up the foreign synagogues against the Christians are called apostles. All these ideas help to show us what the Christian apostles were. It should be remembered, however, that the term apostle is used in its Christian sense in two ways at least, in a wider and in a narrower sense. In the narrower and more strictly technical sense the apostles were the eleven whom Christ chose to be special witnesses for Him because they had been with Him from the beginning, together with Matthias, selected by the apostles to fill the place of Judas before the descent of the Holy Spirit, or as some with more probability think, Paul, who was selected for this place by Christ Himself. On the other hand, many others are called apostles who did not belong to this company,—Barnabas, for example (Acts xiv. 14), Andronicus and Junias (Rom. xvi. 7), and others (2 Cor. viii. 23; Phil. ii. 25). This vagueness in the New Testament use of the term makes it somewhat difficult to speak with anything like precision of the relation in which the apostles stood to the office-bearers and members of the early Christian community. But one or two statements enable us to see what were the functions of the apostles strictly so called. It is said, for example, that Christians are built upon the foundation of the apostles and prophets, Jesus Christ Himself being the chief corner-stone (Eph. ii. 20), and the capacity of the apostles to act in this way as a foundation is explained by passages which seem to say that the qualifications for apostleship were—to have been with the Lord from the beginning, to have seen and recognized Christ after the resurrection, to have been witnesses of the ascension, and to have been gifted with peculiar spiritual gifts. And we may say generally, that just as the prophets of the Old Testament were the links between their own generation by their speech, and between future generations by their writings, and the Saviour that was to come, so the apostles were the links between the first generation of Christians by their presence and influence, and between all succeeding generations of Christians by their writings, and the Saviour who had come. They were to serve as the connection between the first generation of Christians and Jesus, and were to have

no successors but the writings of the New Testament canon, which has taken their place and done their work for all succeeding generations.

The relation of the apostles, therefore, to the primitive church was altogether unique, as indeed is implied in their name; and when they act or give official advice apart from their apostolic office, which they did in certain cases, they do so as elders chosen to act along with the other elders who did not possess apostolic gifts. If these views are correct the autonomy of the early Christian communities was complete during the lifetime of the apostles, and was quite independent of the apostolic office and authority.

This thought has an important bearing on the history of the growth of the Christian government. In the 5th ^{The growth of the} and 6th centuries we find that the government was episcopal, ^{of the episcopate.} and that the principles on which it rested were very different from those which lay at the basis of the government of the Christian community during the apostolic times. The identity of the terms bishop and presbyter within the apostolic church is now so universally admitted by scholars that the sole question really is, When did bishops begin to exist as separate and superior officers? and the dispute becomes one of historical facts rather than dogmatic theories. According to one account the episcopate became the form of the government about the year 70 A.D., to meet and supply in a legitimate way a want which, if not supplied, might have caused the ruin of Christianity; and according to another and more probable theory, the episcopate in the strict sense of the word was not established until the 3d or 4th century. It arose during a panic, and was really a false development of the primitive government, and sanctioned neither by scripture nor by the necessities of the times. Of course the discussion is very much mixed up with the question whether the apostolic office was or was not a permanent one in the Christian church.

According to the one theory, the year 70 A.D. may be taken as the turning point. The episcopate claimed and exercised as part of its official duties all those gifts of rule and special inspiration which the Montanist prophets had laid claim to. The bishops laid claim to powers of rule over the Christian community not as chosen representatives of the Christian people, but as the official representatives of the apostles.

The corrup-
tions of
Chris-
tianity.

It only remains to allude briefly to the corruptions of Christianity. It has been already stated that Christianity had a fourfold conflict to maintain with Judaism, Rome, Gnosticism, and an enthusiastic and sometimes immoral pietism. If we add to these pagan superstition, we shall have the chief heads of the opposition which Christianity had to encounter. After its triumph these sources of anti-Christian action still remained to be contended against, and became the chief springs of its corruption. The spirit of Judaism, of Roman worldly policy, of pagan supersti-

tion, of pagan philosophy, and of immorality entered into Christianity and tended to corrupt it.

One of the earliest causes of the corruption of Christianity was the attempt to translate the Christian kingdom of God into a visible monarchy in which the saints inherited the earth in a literal way. The Church was the more tempted to enter into this course during the period of the decay of the Roman empire, when civil authority became very weak and the real rulers were in many cases the principal clergy of the place. The consciousness of power inspired a desire for its insignia, and soon the bishop and superior clergy adorned themselves in the official robes of Rome's municipal and provincial officers. This whole tendency received a great impulse during the period that Rome was abandoned by her emperors, and when the chief citizen in the imperial city was undoubtedly the Christian bishop. How all this tended to corrupt Christianity is very apparent. In the first place it generated the idea that the Christian kingdom is a visible monarchy and that its marks are such as can be seen; and it led Christians to postpone everything to the earthly aggrandizement of the church. It translated spiritual forces into mechanical and physical equivalents. The very term spiritual, which belongs to the affections and emotions and thoughts and will, to the whole inward life, was used to denote whatever belonged to the church or the clergy. Land became spiritual when it passed into the hands of the bishops; men were spiritual if they were servants of the church; things were spiritual if they were church property. There resulted, in short, a gradual coarsening of ideas, and all that was most inward, hidden, and sacred was forgotten in the strife for worldly position and power and wealth. On the other hand, this tendency worked a good deal deeper. Worldly men who found their way into the ministry were tempted to favour any kind of superstitious error that tended to bring them profit and power. The people were often disposed to fancy that the priests could serve God in their stead, and that there were mysteries in religion which the priests understood, but which the laity need not know anything of and ought not to inquire into. Hence they were ready to follow blindly the guidance of the priests in religious matters, just as a man trusts his legal concerns to his lawyer, doing what he directs and not considering it necessary himself to study law. Ambitious and worldly minded rulers, too, are generally glad to make use of religion as an instrument for securing the submission of the people to tyrannical oppression, and for aiding their ambitious views when they seek to subdue their neighbours under the pretext of propagating the true faith. Then again, this idea tends to breed false views of Christian unity. It leads men to think that they cannot be true Christians unless they belong to one community which is visible and universal. And this idea tends to keep up and intensify other errors. For if a man is convinced that all Christians are bound to belong to some one community on earth, he will dread nothing so much as separation from that church, whatever it may be, which he considers as having the best claim to be that one community.

Many corruptions of Christianity have been either introduced or favoured and kept up by moral corruption in the members of a Christian Church. For it belongs to the true gospel to purify and also to elevate the moral character. Hence there is a complete and constant opposition between genuine Christianity and all the evil and base propensities of man's nature. Every kind of depravity or moral defect therefore predisposes men either to reject Christianity altogether, or else to introduce or to accept some erroneous views of it. And there is no kind of religious corruption against which men are usually less on their guard. They are well aware, indeed that there is a danger of men's

falling into sin in violation of the precepts of religion, but they are too apt to think that a man who has embraced a true faith will therefore be made a good moral man. This erroneous idea appears in its most extreme form in the views of those who have been called Antinomians, and who have appeared in all ages of the church from apostolic times down to our own day. They appear to believe that whoever has faith is thereby lifted into a new life to which the moral laws of the old life are inapplicable, and are therefore privileged to do without censure or danger what others would be condemned for.

Nothing perhaps has tended more thoroughly to corrupt Christianity than the introduction into it of superstitions which are really pagan themselves, or have been suggested by pagan practices. Paganism, unable to oppose Christianity successfully, has done much to corrupt it, and in numberless ways has made inroads upon its purity.

The corruptions which entered into Christianity from Judaism have already been noticed, and the corrupting effects of the reproduction of the symbolic temple worship and the Jewish idea of priesthood need not be again referred to. It only remains to speak of those corruptions which have arisen from the contact of Christianity with pagan philosophy. The special corruptions which have arisen from this contact have been called heresies, and have been

of various kinds and degrees, but of these we need not speak. A more subtle influence, and one to be even more jealously guarded against, is the transformation of Christianity itself into an intellectual system or philosophy, or the supposition that it is the intellectual side of Christianity which is the only one or the chief. The inevitable tendency of such an impulse is to remove Christianity as a system to be apprehended from the Christian people, and to reduce their relation to it to a submissive assent to Christian doctrine as that is manufactured for them by the dogmatic machinery of the church. And thus, in place of that whole-hearted trust which waits for personal illumination, there is on the side of the people a blindfold assent, and on the other side the claim to an infallible system of intellectual truth.

The continual and steady growth of Christianity, its vigorous life in spite of various seasons of unavoidable ebb and notwithstanding the presence of all these and other sources of corruption, and its continual rejuvenescence, are no ordinary proof of its divine origin as well as of its supreme fitness for the position in the world which it claims to occupy.

Christl. Kirche*. (T. M. L.)

CHRISTIANSAND, a fortified seaport town of South Norway, capital of a stift of the same name, on a fiord of the Skagerrack, in 58° 8' N. lat. and 8° 3' E. long. The town, which is surrounded on three sides by water, is defended by the fort of Fredericksholm, at the mouth of a deep and well sheltered harbour. The houses, mostly of painted wood, are regularly built, and the streets are wide. Christiansand has a fine cathedral, and a cathedral school; it is a naval station, and the seat of a bishop, and of a stiftsamtmand or governor of the province. The principal branches of industry are tanning, tobacco-manufacture, ship-building, dyeing, and brewing, and the exportation of timber, pitch, skins, copper and iron, fish, and lobsters. The mackerel and salmon brought to the harbour are packed in ice on their arrival, and shipped mostly to England. The number of fresh mackerel exported in 1874 was 897,110, value £5441, inclusive of the expense of ice and packing; of salmon, 209,131 lb, value £9273; of lobsters the number exported was 201,980. The number of British ships in cargo and in ballast at Christiansand in 1873 was 203. The town was founded in 1641 by Christian IV., after whom it was named. In 1807 it was held for a time by the British. Population (1870), 11,468.

CHRISTIANSTAD, a town in the south of Sweden in 56° 2' N. lat. and 14° 9' E., long., the capital of the laen of the same name, stands on a lake formed by the widening out of the Helge River, in a swampy situation, about ten miles from the shores of the Baltic. At the mouth of the river is the village of Åhus, the port of Christianstad. The town of Christianstad, which consists chiefly of wooden structures, contains a fine church, a high school, and an arsenal, and is the residence of the chief governor of the laen. The manufactures are leather, woollen goods, gloves, and tobacco; and there is some trade in corn. Christianstad was founded and strongly fortified in 1614 by Christian IV. of Denmark; in 1658 it was ceded to Sweden at the peace of Roskilde; in 1676 it was taken by Christian V.; but in 1678 it was again acquired by Sweden. Here began the revolution that was the means of establishing the power of Gustavus III. in Sweden. Population, 6599.

CHRISTIANSUND, a seaport town on the west coast of Norway, in the amt of Romsdal, 85 miles W.S.W. of

Trondhjem, in 63° 3' N. lat. and 7° 40' E. long. It is built on three small islands, by which its harbour is enclosed. The chief exports are wood, fish, and fish products. Till 1742 Christiansund was called Lille-Fosen. Population, 5709.

CHRISTINA (1626-1689), queen of Sweden, was the second daughter of Gustavus Adolphus and Mary Eleanor of Brandenburg. Disappointed in his hopes of male offspring, her great father reared her in virile fashion, and left her, on his departure for Germany (1630), in the hands of Axel Oxenstiern, the famous chancellor, and of Johannes Matthiæ, his own almoner, who was to ground her in sciences and in Latin and Greek.

The battle of Lützen placed Christina on the throne in her sixth year. She was proclaimed queen without delay, but the government was vested in a council of regency, composed of the five chief dignitaries of the kingdom, with Oxenstiern at their head. Placed under the care of her aunt Catharine, the countess-palatine, the little queen made rapid progress in the direction indicated by Gustavus. At ten years old she dressed usually in boy's clothes, and was wont to hunt and to go long journeys on foot and on horseback; and she found means, in the midst of these occupations, to acquire several sciences and modern languages, in addition to the classical tongues. In 1636 Oxenstiern returned from Germany, and again assumed the direction of affairs; and from him, her father's friend and minister, Christina received the ablest lessons in state-craft and the art of government that the age could furnish. At sixteen, the confidence reposed in her was such, that she was generally solicited to enter on the exercise of her functions as queen regnant. This proposal she declined, however, nor would she listen to any renewal of it till two years later (1644), when the conduct of the state was placed in her hands. For a time all went well. The members of the council of regency were confirmed in their places; the kingdom was flourishing within and without; the war with Denmark and Germany promised to bear good fruits. Christina, however, had determined on peace, in this she was opposed by Oxenstiern; but during the following year a treaty was signed with Denmark exceedingly advantageous to Sweden. Germany was

not so easily dealt with; Christina was compelled to form a secret conspiracy against her own ministers; and by her efforts, ably seconded by those of Adler Salvius, a young diplomatist to whom she had entrusted the affair, the peace of Westphalia was concluded (1648), and the Thirty Years' War was brought to an end.

The eyes of Europe were now fixed on the young queen. Offers of alliance came to her from all quarters—from Holland and Spain, from England and France. She continued for some time to deserve the esteem with which she was regarded, reforming abuses, filling the treasury, and encouraging arts and commerce to the utmost in her power. It was the general wish that she should marry, and many suitors were proposed. Christina excused herself in an epigram; and to rid herself of further importunities she named her cousin Charles Gustavus her successor, presenting him in that capacity to the assembled estates in 1649, and in 1650 she solemnly took to herself the title of king.

At this time the change would seem to have come upon Christina's conduct that was to determine so much of her subsequent career, induced apparently by the maxims of a certain Bonrdelot, a French physician in her employ. The practice of a cynical epieureanism became her only occupation. The reign of favourites began; and with it the welfare of the kingdom commenced to decline. Honours, dignities, and treasure were lavished on the most worthless of men; and discontent grew rife everywhere beyond the palace. Christina was alarmed, and had thoughts of abdication (1651); but her designs were vigorously opposed by Oxenstiern, and for a while she yielded to the pressure brought to bear on her by the chancellor and his party. The favourites (among whom were Whitelock, Cromwell's envoy, Pimentelli, the Spanish ambassador, and Chanut, the representative of France) were kept in the background, and Bourdelot, the master cynic, was sent out of Sweden. Christina encouraged the presence of artists and men of science; Descartes, an exile from his native land, was received by her with great consideration; she made large purchases for the Swedish museums; she corresponded with Vossius and Salmasius, with Puffendorf and Grotius, with Naudé and Boehard; she did her best to rule and to be respectable. But she was weary of the roughness and coarseness of the land of her birth; she longed for freedom and change; she was conscious, moreover, of her own gradual degradation in the eyes of the subjects she despised. The conspiracy of Messenius, the chiefs of which perished on the scaffold, gave her an excuse and the opportunity she had long desired. In 1654 the estates were convoked at Upsala, and she resigned the crown to her cousin Charles Gustavus.

She had reserved to herself her own independence, an absolute authority over such of her subjects as should accompany her, and the revenues of Pomerania and Mecklenburg, with those of several Swedish provinces. Quitting the habit of her sex, and taking the words *Fata viam invenient* as a device, she left her kingdom, traversed Denmark and Germany, and established herself at Brussels. Here she remained for nearly a year, signaling her sojourn by the private renunciation of Lutheranism, which she afterwards solemnly and publicly abjured at Innsbruck. From Innsbruck she went to Italy. She entered Rome on horseback, was received, confirmed, and baptized Alexander by Alexander VII., and was lodged in the Palazzo Farnese, where she surrounded herself with artists and amorists, with philosophers and scientific mountebanks. In 1656, having quarrelled with some of the College of Cardinals, she made her first trip to France, where she had much success as a spectacle, called on the king at Compiègne, was lodged at Fontainebleau, and stayed for some time in Paris. She was most gracious with

the men of letters and science, but she outraged all the women by her expressions of contempt for their sex and themselves (which called forth many illiberal remarks concerning her spare figure and humped shoulder), and declared that Ninon de l'Enclos was the only one of them worth her regard. She also attempted to instil a few of her own political theories into the bosom of Mazarin; but that subtle diplomatist resisted, and when in the following year, after a journey to Italy, she attempted to renew her visit, he found means to have her detained at Fontainebleau. It was here that, after writing to Cromwell, who would none of her, she caused her favourite Monaldeschi, in revenge for the betrayal of her secrets, to be put to death by the captain of her guard. The public indignation was great, and she was ordered to leave France. Leibnitz, however, apologized for the crime, and she took no notice of her expulsion till 1658, consoling herself meanwhile with the society of a kindred spirit, Madame de la Suze. In that year she returned to Rome; and the Swedish revenues coming slowly in, Alexander allowed her a pension. In 1660 Charles Gustavus died, and Christina returned to Sweden, to claim the throne she had quitted so lightly and regretted so bitterly. But the Swedes had lost their old reverence for the daughter of Gustavus; her new religion and her treatment of Monaldeschi had made them wary of her; and she was compelled to sign another and more binding deed of abdication, and once more to retreat to Rome. She reappeared in Sweden some six years afterwards; but the exercise of her faith was denied her, and she withdrew to Hamburg, where she begged in vain the empty crown of Poland, and whence she made for Rome once more. In that city she lived for some twenty years, quarrelling, intriguing, and collecting, corresponding with men of letters and founding academies, active in the Molinist controversy and in the cause of the Venetians besieged by the Turks, consumed by the desire of that political power which she had thrown away, and endeavouring to assert her vanished influence to the last. She died, with great composure, in 1689, and was buried, under a sonorous epitaph, in St Peter's. Her magnificent library was purchased by Alexander VIII., her collection of antiques and part of her paintings by Odescalchi, a nephew of the Pope, and the remainder of her pictures by the regent Orléans.

Christina left many MSS., which were collected and published by Arehenholtz, librarian to the landgrave of Hesse Cassel, in his memoirs of her life, 4 vols. 4to, 1751. Her life was also written by Jacques Lacombe, a translation of whose work, said to be superior to the original, appeared in London in 1776. See also D'Alembert, *Mémoires et Réflexions sur Christine, Reine de Suède*.

CHRISTINE DE PISAN (1363-1431), though French by education and renown, was of Italian stock, and was born at Venice. When she was five years old, she went to her father, a councillor of the Venetian Republic, at Paris, where he held office as astrologer to Charles V. Educated at that prince's court as completely as the age would allow, at fifteen Christine married Étienne du Castel, Charles's notary and secretary. After the king's death, her father lost his appointment, and died soon after of grief and infirmity; and his decease being presently followed by that of her husband, she found herself at five and twenty without a protector, and with three children depending on her for bread. The vexations and discomforts attendant on several suits at law determined her to have recourse to letters as a means of livelihood. Between 1399 and 1405, as she herself declares, without reckoning minor pieces, she composed some fifteen important works. Neither fame nor protection failed her. The earl of Salisbury, in Paris on the occasion of the marriage of Richard II. with Isabella of France (1396), took her eldest son, and reared him as his

own; the boy, after Salisbury's death (1400), being received and nurtured by Philip of Burgundy, at whose solicitation Christine wrote *Le Livre des Faits et bonnes Mœurs du Saigne Roy Charles*. Henry IV. of England desired her to make his court her home, and she received a like invitation from Galeazzo Visconti tyrant of Milan. She preferred, however, to sojourn in France, where she enjoyed the favour of Charles VI., the dukes of Berry and Burgundy, the prince of Guienne, and others. Of the circumstances of her death nothing is known. A son of her's, however, Jean du Castel, is said to have attained distinction as a poet under Charles VII. Christine de Pisan wrote voluminously in prose and verse. Her works are by no means devoid of merit, nor altogether without interest even at the present time, though the language in which they are written is crude and imperfect, and they sin too often on the side of diffuseness. They are principally of a moral character, Christine seldom interfering in the political questions of her age save to clamour for peace and unity. There is no complete edition of her works. One of them, *Le Livre des Faits d'Armes et de Chevalerie*, was translated into English and printed by order of Henry VII.

CHRISTMAS DAY (French, *Noël* from *Dies natalis*; German, *Weihnachtsfest*; Old Eng. and Scand., *Yule*; Ang.-Sax., *Geol*), a festival of the Christian church, observed on the 25th of December, in memory of the birth of Jesus Christ. There is, however, a difficulty in accepting this as the date of the Nativity, December being the height of the rainy season in Judea, when neither flocks nor shepherds could have been at night in the fields of Bethlehem.

The Christian communities which keep Christmas (as the Roman Catholic, Greek, Armenian, and indeed all Episcopalian churches, and the Lutherans) would probably agree in laying more stress on keeping a day in memory of the Nativity, than on success in selection of the actual and precise date of the event. Indeed in the parallel case it does not appear that Good Friday and Easter lose anything of their respective associations from their variableness in different years. Although as regards Christmas an ingenious case on behalf of the month of October has been made out from what is known concerning the course of Abia, (Luke i. 5.) it does not seem possible to arrive at any certain conclusion. By the 5th century, however, whether from the influence of some tradition, or from the desire to supplant heathen festivals of that period of the year, such as the *Saturnalia*, the 25th of December had been generally agreed upon. Augustine expressly mentions this date (*De Trin.* iv. 5); and Chrysostom seems to speak of it as a custom imported from the West within ten years. Before that time it appears to have been kept conjointly with the feast of the Epiphany on the 6th of January. It is generally considered to rank third among the festivals of the church (Easter and Whitsuntide alone being placed above it) and to have a joy peculiarly its own.

In all civilized countries the annual recurrence of Christmas has been celebrated with festivities of various kinds. In none, however, was it more joyfully welcomed than in England, where even still the "old honour" has not altogether fled. In that country it was the custom on Christmas eve, after the usual devotions were over, to light large candles and throw on the hearth a huge log, called the Yule Log or Christmas Block. At court, and in the houses of the wealthy, an officer, named the Lord of Misrule, was appointed to superintend the revels; and in Scotland a similar functionary used to be appointed under the title of the Abbot of Unreason, till the year 1555, when the office was abolished by Act of Parliament. The reign of the Lord of Misrule began on All-Hallow eve, and lasted till Candlemas day. The favourite pastimes over which he presided were gaming, music, conjuring, dipping for nuts

and apples, dancing, fool plough, hot cockles, blind-man's buff, &c.; and various Christian preachers (as, for instance, St Bernard) have taken occasion to remonstrate with their flocks for paying too great attention to the festive character of the season, and too little to its more solemn aspects. The favourite dishes for breakfast and supper at this season were the boar's head with an apple or orange in the mouth, and set off with rosemary, plum-pudding, and mince pies. The houses and churches were decked with evergreens, especially with mistletoe, to which a traditional sacredness has attached since the days of the Druids.

As might be expected, this festival has been illustrated by many fine and admirable outpourings of devotion in the way of services, and of Christian oratory, hymnology, and art. The services must be sought in the liturgies and office-books of different communities. Among preachers who have dwelt with striking impressiveness on the ideas and associations of this sacred season may be specially named St Leo, St Chrysostom, St Bernard, Matthias Faber, Bourdaloue, Bishop Andrewes, Dr Mill, Dr Newman. Mediæval Latin hymns may be found in Archbishop Trench's *Sacred Latin Poetry* (London, 1849) and in Daniel's *Thesaurus Hymnologicus*. Many of these have been paraphrased with great effect by German Lutherans, and of late years, with considerable success, by English compilers of hymn-books. Among the most popular original contributions to the English hymns of the season must be mentioned those of Charles Wesley, Tate, Byrom, Heber, and Keble. The Nativity has been represented by a host of great painters; and it is the inspiring theme of a large part of Handel's greatest triumph, the *Messiah*.

Discussions of the questions concerning the actual date of the Nativity and other matters respecting Christmas may be found in Tillemont, *Histoire de l'Église* (tome i.); Martigny, *Dictionnaire des Antiquités Chrétiennes* (Paris, 1865); Caspari, *Chronological and Geographical Introduction to the Life of Christ* (Engl. trans. 1876); Wordsworth's *Greek Testament* (1872); Greswell, *Dissertations* (1840); Pearson, *Minor Works*, vol. ii. (1844); Elliott, *Lectures on the Life of Christ* (1861); Smith and Cheetham, *Dictionary of Christian Antiquities* (1876); A. Maemillan's *Greek Testament* (1876.)

CHRISTOPHER, SAINT, according to the legend, was a Christian martyr of the 3d century, and a native of Palestine or of Syria. Glorifying in his gigantic strength and stature, he resolved to serve none who owned a superior. His first master was more powerful than any man, but it soon appeared that he was exceedingly afraid of the devil. The devil therefore became the master of the future saint. But even he was found not to be superior to fear; for he trembled before the image of Christ. His servant consequently deserted him, and, meeting a hermit who told him of the Saviour, was baptized, and undertook as penance to carry Christian pilgrims over a bridgeless stream. At length a little child requested his aid, but the burden proved more than the giant could support. The child was Christ; and thus is explained the name Christopher (Christ-bearer). As a sign, Christopher's staff, being planted, grew into a palm-tree covered with fruit and foliage,—a miracle which effected the conversion of thousands. In consequence, the prefect Dagnus seized him, and after cruelly torturing him commanded him to be shot with poisoned arrows. These, however, instead of harming him, rebounded and wounded his persecutors. Once entered the eye of the prefect; and in pity Christopher sacrificed himself to save his enemy. He was decapitated, and his blood healed the wound. The festival of St Christopher is celebrated by the Roman Catholic church on the 25th July, by the Greek church on the 9th May. St Christopher was invoked as a defence against pestilence, and in order to frighten away the spirits who watch over hidden treasure.

CHRISTOPOULOUS, ATHANASIAS (1772–1847), a modern Greek poet, was the son of a Greek priest settled

in Wallachia. He studied at Buda and Padua, and became teacher of the children of the Wallachian prince Mourousi. After the fall of that prince in 1811, he was employed by Prince Caradja, who had been appointed hospodar of Moldavia and Wallachia, in drawing up a code of laws for that country. On the removal of Caradja, he retired into private life and gave himself to literature. He wrote drinking songs and love ditties which are very popular among the Greeks. He is also the author of a tragedy, of *Parallels* (a comparison of various systems of government), of translations of Homer and Herodotus, and of some philological works on the connection between ancient and modern Greek.

CHROMIUM, one of the metallic chemical elements, so called from the Greek *χρῶμα*, colour, in allusion to the fine colours of its compounds; symbol Cr, atomic weight 52.4. It does not occur in the free state or very abundantly in nature. It is a constituent of the minerals chrome ironstone, Cr_2FeO_4 ; chrome ochre, Cr_2O_3 ; ouvarovite, or chrome garnet, $\text{Si}_2\text{CaCr}_2\text{O}_{10}$; crocoisite, PbCrO_4 , in which it was discovered by Vauquelin in 1797; of Vanquelinite, a chromate of lead and copper; and of some iron-ores and meteoric irons; and it is the cause of the colour of green serpentine, pyrope, and the emerald. The properties of chromium vary much according to the method of its preparation. By Wöhler's process of reducing the sesquioxide with zinc, it is obtained as a shining green powder, of specific gravity 6.81, which tarnishes in the air, and dissolves in hydrochloric and warm dilute sulphuric acid, but is not acted on by strong nitric acid. Deville, by intensely igniting chromic oxide with sugar-charcoal in a lime crucible, procured chromium of a bright steel-grey colour, very hard, capable of a high polish, less fusible than platinum, and of specific gravity 6. Crystallized chromium obtained by Frémy was unaffected by the strongest acids.

Chromium forms three series of compounds:—the *chromous*, typified by the chloride CrCl_2 , in which chromium is a dyad; the *chromic* or *sesqui*-compounds, such as the oxide, Cr_2O_3 , and chromic chloride, Cr_2Cl_6 , in which the metal plays the part of a tetrad, or pseudo-triad; and *chromate* compounds, in which it is a hexad, exemplified by the hexafluoride, CrF_6 , the oxychloride, CrO_2Cl_2 , the anhydride, CrO_3 , and potassium chromate, K_2CrO_4 . In the hypothetical perchromic anhydride, Cr_2O_7 , chromium may be regarded as an octad.

Chromous salts resemble the ferrous, in forming a dark-brown compound when nitric oxide is added to their solutions. The anhydrous protoxide, CrO , has not been obtained; and the hydrate $2\text{CrO} \cdot \text{H}_2\text{O}$, precipitated of a brown colour from solutions by potassium hydrate, is a very unstable body. The dichloride CrCl_2 is a powerful deoxidizer; it forms with water a blue solution, which turns green on exposure to the air.

The salts of the sesquioxide, or chromic salts, have an acid reaction. They are green, or from red to violet in colour. Ammonia precipitates from solutions of the violet salts a grey-blue hydrate, and from solutions of the green salts, a grey-green hydrate,—the former precipitate giving a red, the latter a green solution with acids. Potash or soda throws down from solutions of the violet or green salts a bluish-green hydrate, soluble in excess of the precipitant, but reprecipitated on boiling. According to Löwel there are four modifications of the hydrate of chrome, two green, one violet-carmine, and a violet-blue. The hydrate can be economically made by boiling two parts by weight of potassium chromate with one of sulphur; the presence of a little potash assists the operation. Sesquioxide of chromium, Cr_2O_3 , occurs native in argillaceous deposits. It may be obtained in the amorphous state by the ignition of the hydrate, and crystallized by

decomposing potassium chromate with chlorine at a red heat. It can be melted at a high temperature into a greenish-black mass, and is with difficulty reduced by charcoal at an intense heat. A mixture of nitric acid and potassium chlorate converts it into chromic acid. The *chromites* are a class of bodies in which chromic oxide Cr_2O_3 is united with protoxides, as in the compound Cr_2O_3 , and in chrome ironstone, Cr_2FeO_4 . The latter, the most abundant ore of chromium, contains besides iron and chromium variable proportions of magnesium and aluminium, and is isomorphous with magnetic iron ore, Fe_3O_4 , and spinel, MgAl_2O_4 . It is a massive and compact, granular, rarely crystallized, black-coloured mineral, of specific gravity about 4.4, and hardness 5.5. It occurs usually in serpentine, and is found in the Shetland Isles, the department of Var in France, Volterra in Tuscany, Silesia, Bohemia, Røraas in Norway, the Urals, near Baltimore in the United States, and in many other localities. In 1869 the exports of chrome ore from Norway amounted to 210 tons. Chrome ironstone can be decomposed in the dry way for analysis by fusion with potassium bisulphate, to which sodium carbonate and then a little nitre are subsequently added. Chromic chloride, Cr_2Cl_6 , can be obtained either in the anhydrous insoluble condition, or as the green hydrated salt, soluble in water. Similar compounds are the fluoride, Cr_2F_6 , the bromide, Cr_2Br_6 , and the iodide, Cr_2I_6 . The sesquisulphates of chromium are the anhydrous salt, $\text{Cr}_2(\text{SO}_4)_3$, the hydrated salts with 5 and 15 molecules of water, a basic sulphate, $\text{Cr}_2\text{O}_3 \cdot 2\text{SO}_3$, and the chrome alums, of the general constitution $\text{Cr}_2\text{M}_2(\text{SO}_4)_4 \cdot 24\text{H}_2\text{O}$, isomorphous with common alum. Certain oxides intermediate between the sesquioxide and trioxide have been termed *chromates of chromium*.

The trioxide or anhydride of chromium, CrO_3 , comparable with sulphuric anhydride, SO_3 , can be prepared by the action of strong sulphuric acid upon potassium bichromate; as the liquid cools, the anhydride separates from it in crimson acicular crystals. It can also be obtained by decomposing barium chromate with nitric acid. Chromic anhydride deliquesces in air, and dissolves in water, forming a solution which contains chromic acid; it is a powerful oxidizer, and acts violently on organic substances, such as alcohol and ether, becoming reduced to the sesquioxide. Dry ammonia gas is converted by it into nitrogen and aqueous vapour. When peroxide of hydrogen, H_2O_2 , is added to a solution of chromium trioxide, an unstable blue compound of probable constitution $\text{H}_2\text{Cr}_2\text{O}_8$, or *perchromic acid*, is formed, which dissolves in ether, and is decomposed by potash and soda, but forms stable compounds with ammonia, quinine, and other bodies. Chromic acid, H_2CrO_4 , has not been isolated, and hydrated salts of the type $\text{HM} \cdot \text{CrO}_4$ are unknown. The *chromates* are a large class of bodies, isomorphous with the sulphates. They are bitter and poisonous salts, mostly of a yellow or red colour, and except those of the alkali metals, and of calcium, strontium, and magnesium, are more or less insoluble in water. Most of the insoluble chromates are basic. The chromates of the alkali metals are the neutral or normal yellow salts, $\text{M}'_2\text{CrO}_4$, or $\text{M}'_2\text{O} \cdot \text{CrO}_3$, and the orange-red bichromates, or acid salts, $\text{M}'_2\text{O} \cdot 2\text{CrO}_3$. Potassium trichromate, $\text{K}_2\text{O} \cdot 3\text{CrO}_3$, represents a third series of chromates. With salts of lead, bismuth, and barium, the alkaline chromates give yellow precipitates; with silver salts, a purplish red; and with mercurous salts, a brick-red precipitate. Boiled with hydrochloric acid they give a green solution of sesquichloride of chromium; and with sulphurous acid, or with sulphuric acid and alcohol, sugar, and other reducing agents, they yield chrome alum. When a chromate is heated with sulphuric acid and common salt, vapours of oxychloride of chromium, or chlorochromic acid,

are produced. Insoluble chromates fused with nitre yield soluble yellow potassium chromate, K_2CrO_4 . This salt is prepared on a large scale by oxidizing chrome-iron ore in a furnace, in the presence of carbonate, sulphate, or chloride of potassium, and chalk or lime. The red bichromate or acid chromate of potassium, $K_2Cr_2O_7$, is made by acidifying a solution of the neutral salt, or by Jacquelin's process, in which chrome-iron ore is ignited with chalk to obtain the neutral chromate of calcium; this is then converted by sulphuric acid into calcium bichromate, which by double decomposition with potassium carbonate yields the potassium bichromate. It melts at a red heat, and at a white heat evolves oxygen, as also when warmed with sulphuric acid. Heated with sulphur or charcoal it deflagrates. The solution gives with sulphydric acid a precipitate of mixed chromic oxide and sulphur. Ammonium bichromate is decomposed on the application of heat into nitrogen, water, and chromic oxide. The oxides and salts of chromium give, in both the inner and outer blowpipe flames, a green bead with borax. Chromium unites with iron and aluminium; and can be obtained combined with mercury by treating a solution of a chromic salt with sodium amalgam. Chromium is estimated gravimetrically in the form of the sesquioxide, or of a lead or barium salt; volumetrically, by the oxidizing effect of a chromate on oxalic acid, hydriodic acid, or potassium ferrocyanide.

The alloy termed *chromeisen*, containing about three parts by weight of chromium to one of iron, is hard enough to serve for cutting glass. An extremely soft steel can be made by employing it instead of *spiegeleisen* in Siemens's steel process. Chromium compounds are in request for a great diversity of purposes. Free chromic acid and potassium bichromate are used in calico-printing, and in bleaching tallow and palm oil. The bichromate is also employed for the volumetric estimation of ferrous salts, in the printing of photographs, and in galvanic batteries; it has even been used with lead chromate for the adulteration of snuff. It is itself sometimes adulterated with a mixture of sulphate and chloride of sodium, coloured with a strong solution of bichromate. Potassium bichromate in contact with the skin produces dangerous ulcers, and internally it acts as a violent poison. Fused lead chromate is of value in organic chemistry as an oxidizer, and the unfused salt is the well-known pigment *chrome-yellow*. *Chrome-red* is a basic lead chromate, Pb_2CrO_5 . Other pigments are the sesquioxide of chromium, or *chrome-green*, used in glass-staining, porcelain-painting, and in the printing of bank-notes; *Pannetier's emerald green*, a hydrate of the composition $H_4Cr_2O_5$; *Leune and Castellaz's green*, another hydrate; *Guignet's pigment vert*, a basic chromic borate; and *Plessy's green*, which is a phosphate of chromium. Casali (*Gazzetta Chimica Italiana*, 1874) recommends for the preparation of an intense green pigment to calcine an intimate mixture of 1 part of potassium bichromate and 3 parts of baked gypsum; the mass obtained is boiled with water, or treated with hydrochloric acid. The pigment used to produce a pink colour on earthenware is made by heating to redness a mixture of 30 parts of peroxide of tin, 10 of chalk, and 1 of potassium chromate,—the product being powdered and washed with hydrochloric acid. (F. H. B.)

CHRONICLES, Books of. In the Hebrew Canon the Chronicles form a single book, entitled דְּבָרֵי הַיָּמִים, *Events of the Times*. The full title would be סֵפֶר דְּבָרֵי הַיָּמִים, *Book of Events of the Times*; and this again appears to have been a designation commonly applied to special histories in the more definite shape—*Events of the Times of King David*, or the like (1 Chron. xxvii. 24; Esth. x. 2, &c.). The Greek translators divided the long book into two, and adopted the title Παραλειπόμενα, *Things omitted* [*scil.* in the other historical books]. Jerome, following the sense of the

Hebrew title, suggested the name of *Chronicon* instead of *Paralipomenon primus et secundus*. Hence the English *Chronicles*.

The book of Chronicles begins with Adam and ends abruptly in the middle of Cyrus's decree of restoration. The continuation of the narrative is found in the book of Ezra, which begins by repeating 2 Chron. xxxvi. 22, 23, and filling up the fragment of the decree of Cyrus. A closer examination of those parts of Ezra and Nehemiah which are not extracted word for word from earlier documents or original memoirs, leads to the conclusion that Chronicles-Ezra-Nehemiah was originally one work, displaying throughout the peculiarities of language and thought of a single editor, who, however, cannot be Ezra himself as tradition would have it. Thus the fragmentary close of 2 Chronicles marks the disruption of a previously-existing continuity,—due, presumably, to the fact that in the gradual compilation of the Canon the necessity for incorporating in the Holy Writings an account of the establishment of the post-Exile theocracy was felt, before it was thought desirable to supplement Samuel and Kings by adding a second history of the period before the Exile. Hence Chronicles is the last book of the Hebrew Bible, following the book of Ezra-Nehemiah, which properly is nothing else than the sequel of Chronicles.

While the original unity of this series of histories can hardly be questioned, it will be more convenient in the present article to deal with Chronicles alone, reserving the relation of the several books for the article EZRA AND NEHEMIAH. The author used a different class of sources for the history before and after the Exile; and thus the critical questions affecting the Chronicles are for the most part quite distinct from those which meet us in the book of Ezra. Besides, the identity of authorship in the two histories cannot be conclusively demonstrated except by a comparison of results drawn from a separate consideration of each book.

Of the authorship of Chronicles we know only what can be determined by internal evidence. The colour of the language stamps the book as one of the latest in the Old Testament, but leads to no exact determination of date. In 1 Chron. xxix. 7, which refers to the time of David, a sum of money is reckoned by *darics* [E. V., *drams*], which certainly implies that the author wrote after this Persian coin had been long current in Judea. But the chief passage appealed to by critics to fix the date is 1 Chron. iii. 19, *sqq.*, where the descendants of Zerubbabel seem to be reckoned to six generations (so Ewald, Bertheau, &c.). The passage is confused, and the Septuagint reads it so as to give as many as eleven generations (so Zunz, Nöldeke); while on the other hand those who plead for an early date are disposed to assume an interpolation or corruption of the text, or to separate all that follows the name of Jesaiah in ver. 21, from what precedes (Movers, Keil). But it seems impossible by any fair treatment of the text to obtain fewer than six generations, and this result agrees with the probability that Hattush, who, on the interpretation which we prefer, belongs to the fourth generation from Zerubbabel, was a contemporary of Ezra (Ezra viii. 2). Thus the Chronicler lived at least two generations after Ezra. With this it accords very well that in Nehemiah five generations of high priests are enumerated from Joshua (xii. 10, *sqq.*), and that the last name is that of Jaddua, who, as we know from Josephus, was a contemporary of Alexander the Great. That the chronicler wrote after the fall of the Persian monarchy has been argued by Ewald and others from the use of the title King of Persia (1 Chron. xxxvi. 23). What seems to be certain and important for a right estimate of the book is that the author lived a considerable time after Ezra, and stood

entirely under the influence of the religious institutions of the new theocracy. This standpoint determined the nature of his interest in the early history of his people.

The true importance of Hebrew history had always centred in the fact that this petty nation was the people of Jehovah, the spiritual God. The tragic interest which distinguishes the annals of Israel from the forgotten history of Moab or Damasens lies wholly in that long contest which finally vindicated the reality of spiritual things and the supremacy of Jehovah's purpose, in the political ruin of the nation which was the faithless depository of these sacred truths. After the Captivity it was impossible to write the history of Israel's fortunes otherwise than in a spirit of religious pragmatism. But within the limits of the religious conception of the plan and purpose of the Hebrew history more than one point of view might be taken up. The book of Kings looks upon the history in the spirit of the prophets—in that spirit which is still echoed by Zechariah (i. 5, 6): "Your fathers, where are they? and the prophets, could they live for ever? But my words and my statutes, which I commanded my servants the prophets, did they not overtake your fathers? so that they turned and said, Like as Jehovah of hosts thought to do unto us . . . so hath he dealt with us." But long before the Chronicler wrote the last spark of prophecy was extinct. The New Jerusalem of Ezra was organized as a municipality and a church, not as a nation. The centre of religious life was no longer the living prophetic word but the ordinances of the Pentateuch and the liturgical service of the sanctuary. The religious vocation of Israel was no longer national but ecclesiastical or municipal, and the historical continuity of the nation was vividly realized only within the walls of Jerusalem and the courts of the Temple, in the solemn assembly and stately ceremonial of a feast day. These influences naturally operated most strongly on those who were officially attached to the sanctuary. To a Levite, even more than to other Jews, the history of Israel meant above all things the history of Jerusalem, of the Temple, and of the Temple ordinances. Now the author of Chronicles betrays on every page his essentially Levitical habit of mind. It even seems possible from a close attention to his descriptions of sacred ordinances to conclude that his special interests are those of a common Levite rather than of a priest, and that of all Levitical functions he is most partial to those of the singers, a member of whose guild Ewald conjectures him to have been. To such a man the older delineation of the history of Israel, especially in the books of Samuel and Kings, could not but appear to be deficient in some directions, while in other respects its narrative seemed superfluous or open to misunderstanding, as for example by recording, and that without condemnation, things inconsistent with the Pentateuchal law. The history of the ordinances of worship holds a very small place in the older record. Jerusalem and the Temple have not that central place in the book of Kings which they occupied in the minds of the Jewish community after the Exile. Large sections of the old history are devoted to the religion and politics of the ten tribes, which are altogether unintelligible and uninteresting when measured by a strictly Levitical standard; and in general the whole problems and struggles of the prophetic period turn on points which had ceased to be cardinal in the life of the New Jerusalem, which was no longer called to decide between the claims of the Word of Jehovah and the exigencies of political affairs and social customs, and which could not comprehend that men absorbed in deeper spiritual contests had no leisure for the niceties of Levitical legislation. Thus there seemed to be room for a new history, which should confine itself to matters still interesting to the theocracy of Zion, keeping Jerusalem and the Temple

in the foreground, and developing the divine pragmatism of the history, not so much with reference to the prophetic word as to the fixed legislation of the Pentateuch, so that the whole narrative might be made to teach that the glory of Israel lies in the observance of the divine law and ritual.

For the sake of systematic completeness the author begins with Adam, as is the custom with later Oriental writers. But he had nothing to add to the Pentateuch, and the period from Moses to David contained little that served his purpose. He, therefore, contracts the early history into a series of genealogies, which were doubtless by no means the least interesting part of his work at a time when every Israelite was concerned to prove the purity of his Hebrew descent (*cf.* Ezra ii. 59, 63). From the death of Saul the history becomes fuller and runs parallel with the books of Samuel and Kings. The limitations of the author's interest in past times appear in the omission, among other particulars, of David's reign in Hebron, of the disorders in his family and the revolt of Absalom, of the circumstances of Solomon's accession, and of many details as to the wisdom and splendour of that sovereign, as well as of his fall into idolatry. In the later history the ten tribes are quite neglected, and political affairs in Judah receive attention, not in proportion to their intrinsic importance, but according as they serve to exemplify God's help to the obedient and His chastisement of the rebellious. That the author is always unwilling to speak of the misfortunes of good rulers is not to be ascribed with some critics to a deliberate suppression of truth, but shows that the book was throughout composed not in purely historical interests, but with a view to inculcate a single practical lesson. The more important additions which the Chronicler makes to the old narrative consist partly of statistical lists (1 Chron. xii., partly of full details on points connected with the history of the sanctuary and the great feasts or the archaeology of the Levitical ministry (1 Chron. xiii., xv., xvi., xxii.-xxix.; 2 Chron. xxix.-xxxii., &c.), and partly of narratives of victories and defeats, of sins and punishments, of obedience and its reward, which could be made to point a plain religious lesson in favour of faithful observance of the law (2 Chron. xiii., xiv. 9, *sqq.*; xx., xxi. 11, *sqq.*, &c.). The minor variations of Chronicles from the books of Samuel and Kings are analogous in principle to the larger additions and omissions, so that the whole work has a consistent and well-marked character, presenting the history in quite a different perspective from that of the old narrative.

Here, then, a critical question arises. Is the change of perspective wholly due to a different selection of items from authentic historical tradition? May we assume that everything which is new in the Chronicles has been taken exactly from older sources, or must we judge that the standpoint of the author has not only governed the selection, but coloured the statement of historical facts? Are all his novelties new data, or are some of them inferences of his own from the same data as lie before us in other books of the Bible? To answer these questions we must first inquire what were the historical materials at his command. The Chronicler makes frequent reference to earlier histories which he cites by a great variety of names. That the names "Book of the Kings of Israel and Judah," "Book of the Kings of Judah and Israel," "Book of the Kings of Israel," and "Affairs of the Kings of Israel" (2 Chron. xxxiii. 18, *Heb.*) refer to a single work is not disputed. Under one or other title this book is cited some ten times. Whether it is identical with the Midrash [E.V., *story*] of the book of the Kings (2 Chron. xxiv. 27) is not certain. According to later usage the term Midrash would mean a commentary on the book of the Kings. But it is perhaps as plausible to suppose with Ewald that the book of the Kings was itself called a Midrash or learned compilation.

That the work so often cited by the Chronicler is not the Biblical book of the same name is manifest from what is said of its contents. It must have been quite an extensive work, for among other things it contained genealogical statistics (1 Chron. ix. 1), and it incorporated certain older prophetic writings—in particular, the *debarim* [words or history] of Jehu the son of Hanani (2 Chron. xx. 34, where for “who is mentioned in” read “which was copied into”) and the vision of Isaiah (2 Chron. xxxii. 32). Now it is noticeable that where the Chronicler does not cite this comprehensive work at the close of a king’s reign he generally refers to some special authority which bears the name of a prophet (2 Chron. ix. 29; xii. 15, &c.). But the book of the Kings and a special prophetic writing are not cited for the same reign. It is therefore highly probable that in other cases than those of Isaiah and Jehu the writings of or about prophets which are cited in Chronicles were known to the author only as parts of the great book of Kings. Even 2 Chron. xxxiii. 18, 19, where the English version departs from the received Hebrew text, but probably expresses the correct reading,¹ seems rather to confirm than to oppose this conclusion, which is now disputed by very few scholars except in the case of Isaiah’s history of Uzziah, 2 Chron. xxvi. 22.² The general conclusion is that it is very doubtful whether the chronicler used any historical work now lost with the exception of the book of Kings. Even his genealogical lists may have been wholly derived from that work (1 Chron. ix. 1), though for these he may also have had other materials at command.

Now we know that the two chief sources of the canonical book of Kings were entitled *Annals* [“events of the times”] of the Kings of Israel and Judah respectively. That the lost source of the Chronicles was not independent of these works at once appears probable both from the nature of the case and from the close and often verbal parallelism between many sections of the two Biblical narratives. But while the canonical book of Kings had separate sources for the northern and southern kingdoms, the source of Chronicles was a history of the two kingdoms combined, and so, no doubt, was a more recent work in great measure extracted from the older annals. Yet it contained also matter not derived from these works, for it is pretty clear from 2 Kings xxi. 17 that the Annals of the Kings of Judah gave no account of Manasseh’s repentance, which, according to 2 Chron. xxxiii. 18, 19, was narrated in the great book of the Kings of Israel. It was formerly the opinion of Bertheau, and is still maintained by Keil, that the parallelisms of Chronicles with Samuel and Kings are sufficiently explained by the ultimate common source from which both narratives drew. But most critics hold that the Chronicler also drew directly from the canonical books of Samuel and Kings as he unquestionably did from the Pentateuch. This opinion is probable in itself, as the earlier books of the Old Testament cannot have been unknown to the author; and perhaps the critical analysis of the canonical book of Kings is already far enough advanced to enable us to say that in some of the parallel passages the Chronicler uses words which were not written in the annals but by the author of Kings himself. In particular Chronicles agrees with Kings in those short notes of the moral character of individual monarchs which can hardly be ascribed to an earlier hand than that of the final author of the latter book. It is, of course, possible, as Bertheau points out, that the author of the chief source of Chronicles already used our canonical book of Kings; and in general the connections of the successive historical books which preceded the present canonical

histories are sufficiently complex to make it very unwise to indulge in positive assertions on a matter in which so many possibilities may be suggested. Those critics who have a low opinion of the historical value of the Chronicles, and especially Graf, are ready to regard the earlier canonical books as the chief source of the work, and to suppose that the author seldom had authority for his additions to Samuel and Kings; while Keil, on the other hand, is anxious to prove that the earlier canonical histories were not used at all, and so makes the most of the value of the special sources open to the Chronicler. The truth probably lies between these two extremes.

The close and frequently verbal coincidence of the text of so many passages of Chronicles and the earlier books raises a presumption that in general the later author copied his sources with great fidelity. In other cases diversities of statement occur from which inferences unfavourable to the Chronicler have often been drawn. It must, however, be remembered that even copyists at that time were allowed a degree of freedom which modern writers would not venture to exercise, and that different recensions of the same book—for example the extant Hebrew text of Samuel and that which lay before the Greek translators—frequently varied not only in points of expression but in names and numbers, in the addition or omission of details and explanatory remarks, and even in larger matters. Of course such variations must be more numerous and important in the case of parallel narratives which are derived only in an indirect way from the same original sources. If proper weight is allowed to these considerations we must agree with Bertheau that “critics ought not to have charged our author with intentional distortions of the narrative or with inventing false statements; evidence to justify such charges cannot be adduced.” Full proof of the soundness of this observation cannot be given without a long discussion of details. As an example it may suffice to take the tendency to exaggerate which has been traced in the larger numbers of Chronicles (1 Chron. xxi. 5 compared with 2 Sam. xxiv. 9, 1 Chron. xxi. 25 compared with 2 Sam. xxiv. 24, and so forth). It may fairly be said that such larger numbers are in general characteristic of a later record. But they prove little as to the idiosyncrasy of the Chronicler, and cannot with any certainty be laid to his charge as an individual, when we find that in the Massoretic text of 1 Sam. vi. 19 the original number 70 has increased to 50,000. The tendency of numbers to grow in successive transcriptions is one which criticism must always keep in view, and which, doubtless, was at work before as well as after the time of the Chronicler.

Variations which can be distinctly connected with demonstrable personal peculiarities of the writer or with the specific object of his work belong to a different category. But here also great caution must be exercised. For example, no part of the narrative has been more suspected than the captivity and repentance of Manasseh. It is argued that the author’s theory of Divine retribution made it incredible to him that a wicked and unrepentant king could enjoy the long reign granted to Manasseh. But it is quite plain from 2 Chron. xxxiii. 18 that this narrative existed in the sources which lay before the writer, and the Assyrian inscriptions have shown that what is said of the captivity of the Judæan king is in perfect accordance with the state of affairs in the Assyrian empire at the time (Schrader, *Keilinschriften und A. T.*, p. 238, *sqq.*).

In general, then, it seems safe to conclude with Ewald, Bertheau, and other cautious critics that there is no foundation for the accusation that the Chronicler invented history in the interest of his parenetic and practical purposes. But on the other hand it is not to be doubted that in shaping his narrative he allowed himself the same freedoms as were

¹ Others, following the Massoretic text, find in verse 19 an unknown prophet Chozai. So E.V. margin has Hosai.

² Zöckler and Keil still dissent from the current view.

taken by other ancient historians, and even by early copyists, and it is the business of historical criticism to form a clear conception of the nature and limits of these freedoms, with a view to distinguish in individual passages between the facts derived by the Chronicler from his written sources and the literary additions, explanations, and influences which are his own. In particular :—

1. His explanations of verbal or material difficulties must be critically considered. Thus even Keil admits an error in 2 Chron. xx. 36, 37, where the Tharshish-ships, that is ships fit for a long voyage, which Jehoshaphat built on the Red Sea (1 Kings xxii. 48), are explained as ships voyaging to Tartessus in Spain. Such criticism is especially necessary where remarks are introduced tending to explain away the differences in religious observances between early times and the period of the Chronicler. Thus in 1 Chron. xxi. 28, *sqq.*, an explanation is given of the reasons which led David to sacrifice on the threshing-floor of Ornan instead of going to the brazen altar at Gibeon. But it is certain that at the time of David the principle of a single altar was not acknowledged, and therefore no explanation was required. In 1 Kings iii. 3, 4, Gibeon appears only as the chief of many high-places, and it is difficult to avoid the conclusion that the Chronicler has simply *inferred* from the importance of this sanctuary that it must have possessed a special legitimization, which could only consist in the presence of the old brazen altar.

2. A certain freedom of literary form was always allowed to ancient historians, and need not perplex anyone who does not apply a false standard to the narrative. To this head belongs especially the introduction of speeches like that of Abijah in 2 Chron. xiii. This speech is no doubt a free composition, and would be so understood by the author's contemporaries. By such literary devices the author is enabled to point a lesson without interrupting the thread of his narrative by reflections of his own. Similar remarks apply to the Psalm in 1 Chron. xvi., which is made up of extracts from Psalmus cv., xvi., cvi.

3. A usage not peculiar to the Chronicler among Old Testament writers, and which must be carefully taken into account by the historical critic, is that of giving statistical information in a narrative form. This is the principle which underlies many genealogical lists of the Bible, and which alone explains the variations between different accounts of the genealogy proceeding from a single ancestor. Information as to the subdivisions of clans, the intermingling of populations, and the like, is thrown into a genealogical form. Thus the different sons of a father often stand merely for the branches of a family as they

existed at some one time. Of course lists made out at different times when the divisions of clans had varied produce an apparent discrepancy in the names of the sons. The union of two clans is expressed as marriage, or the territory is the wife, and her several husbands are successive populations, and so forth.¹ A different application of the same principle seems to lie in the account of the institutions of Levitical service which is introduced in connection with the transference of the ark to Jerusalem by David. The author is not concerned to distinguish the gradual steps by which the Levitical organization attained its full development. But he wishes to describe the system in its complete form, especially as regards the service of the singers, and he does this under the reign of David, who was the father of Hebrew psalmody, and the restorer of the sanctuary of the ark.

This account of some of the leading points of view which criticism of the Chronicles has to take up makes no pretence at completeness, but may suffice to indicate the nature of the problems which arise in a detailed study of the narrative, and to show that much is to be learned from the book not only in the way of supplement to the earlier history, but for the better understanding of the religious spirit and ordinances of the theocracy as it was after Ezra.

Literature.—Many parts of the Chronicles offer a very hard task to the expositor, especially the genealogies, where to other troubles is added the extreme corruption and many variations of the proper names in the versions. Jerome already complains of this difficulty in the Greek and Old Latin, and tells us what pains he himself took to secure right readings with the aid of a learned Jew. Commentators have rather shrunk from approaching the book. The best exposition is the very careful work of Bertheau (1st ed. 1854, Eng. Trans. 1857, 2d ed. 1860). There are also commentaries by Keil (Leipsic, 1870, Eng. Trans. 1872) and Zöckler (in Lange's *Biblical Commentary*, 1874). Bertheau is cautiously critical, Keil conservative and apologetic, Zöckler not quite so conservative. Valuable contributions to the exegesis of the book are to be found in Ewald's *History of Israel*. Rawlinson's notes in the *Speaker's Commentary* are not very important. There is a large literature on isagogic questions, and especially upon the credibility of the narratives peculiar to Chronicles. Besides the full discussions in books of O. T. introduction (especially De Wette-Schrader, and Keil), the student must refer to the very valuable discussion in the introductory part of Ewald's history, and to the separate treatises of Movers, *Kritische Untersuchungen über die Biblische Chronik*, Bonn, 1834, (in answer to the assaults of De Wette and Grunberg), and Graf, *Die Geschichtlichen Bücher des A. T.*, Leipsic, 1866. Graf concludes that the Chronicles have almost no value as a documentary source for the ancient history; but in private correspondence with Bertheau he subsequently admitted that this statement is too strong (see the preface to Bertheau's 2d edition). The older works are enumerated by Carpzov, and in other books of introduction. Lagarde's edition of the *Targum*, which is not in the Rabbinical Bibles, deserves special mention (*Hagiographa Chaldaica*, Leipsic, 1873). (W. R. S.)

CHRONOLOGY

CHRONOLOGY (from the Greek *χρονολογία*, computation of time) is the science which treats of time. Its object is to arrange and exhibit the various events which have occurred in the history of the world in the order of their succession, and to ascertain the intervals of time between them.

The preservation of any record, however rude, of the lapse of time implies some knowledge of the celestial motions, by which alone time can be accurately measured, and some advancement in the arts of civilized life, which could only be attained by the accumulated experience of many generations. Before the invention of letters the memory of past transactions could not be preserved beyond a few years with any tolerable degree of accuracy. Events which greatly affected the physical condition of the human race, or were of a nature to make a deep impression on the minds of the rude inhabitants of the earth, might be

vaguely transmitted through several ages by traditional narrative, but intervals of time, expressed by abstract numbers, and these constantly varying besides, would soon escape the memory. The invention of the art of writing afforded the means of substituting precise and permanent records for vague and evanescent tradition; but in the infancy of the world, mankind had learned neither to estimate accurately the duration of time, nor to refer passing events to any fixed epoch. Writing was practised many centuries before historians began to assign dates to the events they narrated. The masterpieces of Herodotus and Thucydides, while setting forth, each in the manner suited to the author's aim, events in the order of their succession, are stories without dates.

¹ On the application of this style of expression to the genealogies of Chronicles, the reader may consult Wellhausen, *De Gentibus et Familiis Judo-is quæ in Chr. ii. iv. enumerantur*, Göttingen, 1870.

For these reasons the history of the early ages of the world is involved in almost impenetrable obscurity, and chronology, comparatively speaking, is only of recent origin. After political relations began to be established, the necessity of preserving a register of passing seasons and years would soon be felt, and the practice of recording important transactions must have grown up as a necessary consequence of social life. But of these early records a very small portion only has escaped the ravages of time and barbarism.

The earliest written annals of the Greeks, Etruscans, and Romans are irretrievably lost. The traditions of the Druids perished with them. A Chinese emperor has the credit of burning "the books" extant in his day (about 220 B.C.), and of burying alive the scholars who were acquainted with them. And a Spanish adventurer destroyed the picture records which were found in the *pueblo* of Montezuma.

Of the more formal historical writings in which the first ineffectual attempts were made in the direction of systematic chronology we have no knowledge at first-hand. Of Hellenicus, the Greek logographer, who appears to have lived through the greater part of the 5th century B.C., and who drew up a chronological list of the priestesses of Here at Argos; of Ephorus, who lived in the 4th century B.C., and is distinguished as the first Greek who attempted the composition of a universal history; and of Timæus, who in the following century wrote an elaborate history of Sicily, in which he set the example of using the Olympiads as the basis of chronology, the works have perished, and our meagre knowledge of their contents is derived only from fragmentary citations in later writers. The same fate has befallen the works of Berosus and Manetho, Eratosthenes and Apollodorus. Berosus, a priest of Belus living at Babylon in the 3d century B.C., added to his historical account of Babylonia a chronological list of its kings, which he claimed to have compiled from genuine archives preserved in the temple. Manetho, likewise a priest, living at Sebennytus in Lower Egypt in the 3d century B.C., wrote in Greek a history of Egypt, with an account of its thirty dynasties of sovereigns, which he professed to have drawn from genuine archives in the keeping of the priests. Of these works fragments only, more or less copious and accurate, have been preserved. Eratosthenes, who in the latter half of the 2d century B.C. was keeper of the famous Alexandrian Library, not only made himself a great name by his important work on geography, but by his treatise entitled *Chronographia*, one of the first attempts to establish an exact scheme of general chronology, earned for himself the title of "father of chronology." His method of procedure, however, was usually conjectural; and guess-work, however careful, acute, and plausible, is still guess-work and not testimony. Apollodorus, an Athenian who flourished in the middle of the 2d century B.C., wrote a metrical chronicle of events, ranging from the supposed period of the fall of Troy to his own day. These writers were followed by other investigators and systematizers in the same field, but their works are lost. Of the principal later writers whose works are extant, and to whom we owe what little knowledge we possess of the labours of their predecessors, mention will be made hereafter.

The absence or incompleteness of authentic records, however, is not the only source of obscurity and confusion in the chronology of remote ages. There can be no exact computation of time or placing of events without a fixed point or epoch from which the reckoning takes its start. It was long before this was apprehended. When it began to be seen, various epochs were selected by various writers; and at first each small separate community had its own epoch and method of time-reckoning. Thus in one city the reckoning was by succession of kings, in another by archons or annual magistrates, in a third by succession of

priests. It seems now surprising that vague counting by generations should so long have prevailed and satisfied the wants of inquiring men, and that so simple, precise, and seemingly obvious a plan as counting by years, the largest natural division of time, did not occur to any investigator before Eratosthenes.

Precision, which was at first unattainable for want of an epoch, was afterwards no less unattainable from the multiplicity, and sometimes the variation, of epochs. But by a natural process the mischief was gradually and partially remedied. The extension of intercourse between the various small groups or societies of men, and still more their union in larger groups, made a common epoch necessary, and led to the adoption of such a starting point by each larger group. These leading epochs continued in use for many centuries. The task of the chronologer was thus simplified and reduced to a study and comparison of dates in a few leading systems.

The most important of these systems in what we call ancient times were the Babylonian, the Greek, and the Roman. The Jews had no general era, properly so called. In the history of Babylonia, the fixed point from which time was reckoned was the era of Nabonassar, 747 B.C. Among the Greeks the reckoning was by Olympiads, the point of departure being the year in which Corcebus was victor in the Olympic Games, 776 B.C. The Roman chronology started from the foundation of the city, the year of which, however, was variously given by different authors. The most generally adopted was that assigned by Varro, 753 B.C. It is noteworthy how nearly these three great epochs approach each other,—all lying near the middle of the 8th century B.C. But it is to be remembered that the beginning of an era and its adoption and use as such are not the same thing, nor are they necessarily synchronous. Of the three ancient eras above spoken of, the earliest is that of the Olympiads, next that of the foundation of Rome, and the latest the era of Nabonassar. But in order of adoption and actual usage the last is first. It is believed to have been in use from the year of its origin. It is not known when the Romans began to use their era. The Olympiads were not in current use till about the middle of the 3d century B.C., when Timæus, as already mentioned, set the example of reckoning by them. Of these and other ancient and modern eras a full account is given in the following pages.

Even after the adoption in Europe of the Christian era, a great variety of methods of dating—national, provincial, and ecclesiastical—grew up and prevailed for a long time in different countries, thus renewing in modern times the difficulties experienced in ancient times from diversities of reckoning. An acquaintance with these various methods is indispensable to the student of the charters, chronicles, and legal instruments of the Middle Ages.

In reckoning years from any fixed epoch in constant succession, the number denoting the years is necessarily always on the increase. But rude nations and illiterate people seldom attach any definite idea to large numbers. Hence it has been a practice, very extensively followed, to employ cycles or periods, consisting of a moderate number of years, and to distinguish and reckon the years by their number in the cycle. The Chinese and other nations of Asia reckon, not only the years, but also the months and days, by cycles of sixty. The Saros of the Chaldeans, the Olympiad of the Greeks, and the Roman Indiction are instances of this mode of reckoning time. Several cycles were formerly known in Europe; but most of them were invented for the purpose of adjusting the solar and lunar divisions of time, and were rather employed in the regulation of the calendar than as chronological eras. They are frequently, however, of very great use in

fixing dates that have been otherwise imperfectly expressed, and consequently form important elements of chronology.

Chronology has shared with history the fruits of the novel researches and remarkable discoveries in the field of antiquity which have especially distinguished the present century. The *memorabilia* of early peoples and ages were set down not only in written records but in monumental inscriptions. The latter, graven on stone or metal, could resist the touch of time and the hand of the barbarian better than the former; and although at various times terrible havoc has been made among them, immense numbers are in existence to this day. In Assyria, Egypt, Persia, Greece, and Italy, the practice of monumental inscription was very general. These inscriptions have attracted the attention of learned men from very remote ages. But as contributions to history and chronology, they have within the present century risen into new and surprising importance. By Grotefend's decipherment of the cuneiform characters, the language of the Babylonian and Persian inscriptions, and by Young's decipherment of hieroglyphics, the language of the Egyptian monuments, two discoveries made within a few years of each other, new fields of vast extent and unknown richness have been opened to historical explorers. These fields are now being diligently worked by some of the greatest living scholars; and from granite block and fragile papyrus roll results are already obtained of rare value and of rarer promise. The Assyrian inscribed cylinders, disinterred but thirty years ago, are yielding up the secrets of a long-buried past, enlarging the horizon of history, and even furnishing the means of giving a precise chronology to periods where all was vague. The publication of the Assyrian Canon by Sir Henry Rawlinson in 1862, verified as it was by the subsequent discovery of a record of a solar eclipse, must mark an epoch in chronological science. Egyptian researches and interpretations have been of similar service, and have strongly tended, if not to establish the complete accuracy, at least to indicate the credibility, of Manetho's account of the Egyptian dynasties. The period through which these dynasties apparently reached was so vast, stretching so far beyond the traditionally accepted limits of man's existence on the earth, that modern chronologers, when they grew critical, could for a long time only shake their heads in profound doubt over Manetho and his vistas of shadowy kings. For Egyptian chronology the discovery by Mariette, in 1864, of the *Apis Stela* is one of the highest importance. A flood of light has been poured on some obscure pages of early Persian history by the great cuneiform inscription of Behistun, discovered in 1835 by Colonel Rawlinson, who subsequently copied and translated it.

In the article *CALENDAR* (*q.v.*), that part of chronology has been already treated of which relates to the measurement of time, and the principal methods explained with sufficient detail that have been employed, or are still in use, for adjusting the lunar months of the solar year, as well as the intercalations necessary for regulating the civil year according to the celestial motions. In the present article it is our purpose to give an account (without repeating what has been discussed in full in the article just named) of the different *Eras* and *Periods* that have been employed by historians, and by the different nations of the world, in recording the succession of time and events, to fix the epochs at which the eras respectively commenced, to ascertain the form and the initial day of the year made use of, and to establish their correspondence with the years of the Christian era. These elements will enable us to convert, by a simple arithmetical operation, any historical date, of which the chronological characters are given according to any era

whatever, into the corresponding date in our common era of the Incarnation.

Julian Period.

Although the Julian Period (the invention of Joseph Scaliger, in 1582) is not, properly speaking, a chronological era, yet, on account of its affording considerable facilities in the comparison of different eras with one another, and in marking without ambiguity the years before Christ, it is very generally employed by chronologers. It consists of 7980 Julian years; and the first year of the Christian era corresponded with the year 4714 of the Julian period. (Sec vol. iv. p. 670.)

Olympiads.

The Olympic games, so famous in Greek history, were celebrated once every four years, between the new and full moon first following the summer solstice, on the small plain named Olympia in Elis, which was bounded on one side by the River Alpheus, on another by the small tributary stream the Cladus, and on the other two sides by mountains. The games lasted five days. Their origin, lost in the dimness of remote antiquity, was invested by priestly legends with a sacred character. They were said to have been instituted by the Idæan Hercules, to commemorate his victory over his four brothers in a foot race. According to a tradition, possibly more authentic, they were re-established by Iphitus, king of Elis, in concert with the Spartan Lycurgus and Cleosthenes of Pisa. The practice was long afterwards adopted of designating the Olympiad, or period of four years, by the name of the victor in the contests of the stadium, and of inscribing his name in the gymnasium of Olympia. The first who received this honour was Coræbus. The games in which Coræbus was victor, and which form the principal epoch of Greek history, were celebrated about the time of the summer solstice 776 years before the common era of the Incarnation, in the 3938th year of the Julian period, and twenty-three years, according to the account of Varro, before the foundation of Rome.

Before the introduction of the Metonic cycle, the Olympic year began sometimes with the full moon which followed, at other times with that which preceded the summer solstice, because the year sometimes contained 384 days instead of 354. But subsequently to its adoption, the year always commenced with the eleventh day of the moon which followed the solstice. In order to avoid troublesome computations, which it would be necessary to recommence for every year, and of which the results differ only by a few days, chronologers generally regard the 1st of July as the commencement of the Olympic year. Some authors, however, among whom are Eusebius, Jerome, and the historian Socrates, place its commencement at the 1st of September; these, however, appear to have confounded the Olympic year with the civil year of the Greeks, or the era of the Seleucidae.

It is material to observe, that as the Olympic years and periods begin with the 1st of July, the first six months of a year of our era correspond to one Olympic year, and the last six months to another. Thus, when it is said that the first year of the Incarnation corresponds to the first of the 195th Olympiad, we are to understand that it is only with respect to the last six months of that year that the correspondence takes place. The first six months belonged to the fourth year of the 194th Olympiad. In referring dates expressed by Olympiads to our era, or the contrary, we must therefore distinguish two cases.

1st, When the event in question happened between the 1st of January and the 1st of the following July, the sum of the Olympic year and of the year before Christ is always equal to 776. The year of the era, therefore, will be found by subtracting the number of the Olympic year from 773.

For example, Varro refers the foundation of Rome to the 21st of April of the third year of the sixth Olympiad, and it is required to find the year before our era. Since five Olympic periods have elapsed, the third year of the sixth Olympiad is $5 \times 4 + 3 = 23$; therefore, subtracting 23 from 776, we have 753, which is the year before Christ to which the foundation of Rome is referred by Varro.

2d, When the event took place between the summer solstice and the 1st of January following, the sum of the Olympic year and of the year before Christ is equal to 777. The difference therefore between 777 and the year in one of the dates will give the year in the other date. Thus, the moon was eclipsed on the 27th of August, a little before midnight, in the year 413 before our era; and it is required to find the corresponding year in the Olympic era. Subtract 413 from 777, the remainder is 364; and 364 divided by four gives 91 without a remainder; consequently the eclipse happened in the fourth year of the ninety-first Olympiad, which is the date to which it is referred by Thucydides.

If the year is after Christ, and the event took place in one of the first six months of the Olympic year, that is to say, between July and January, we must subtract 776 from the number of the Olympic year to find the corresponding year of our era; but if it took place in one of the last six months of the Olympic year, or between January and July, we must deduct 777. The computation by Olympiads seldom occurs in historical records after the middle of the 5th century of our era.

The names of the months were different in the different Grecian states. The Attic months, of which we possess the most certain knowledge, were named as follows:—

Hecatombeon.	Gamelon.
Metageitnion.	Anthesterion.
Boedromion.	Elaphebolion.
Pyanepsion.	Munychion.
Mæmacterion.	Thargelion.
Poseideon.	Seirophorion.

Era of the Foundation of Rome.

After the Olympiads, the era most frequently met with in ancient history is that of the foundation of Rome, which is the chronological epoch adopted by all the Roman historians. There are various opinions respecting the year of the foundation of Rome.

1st, Fabius Pictor places this event in the latter half of the first year of the eighth Olympiad, which corresponds with the 3967th of the Julian period, and with the year 747 B.C.

2d, Polybius places it in the second year of the seventh Olympiad, corresponding with 3964 of the Julian period, and 750 B.C.

3d, M. Porcius Cato places it in the first year of the seventh Olympiad, that is, in 3963 of the Julian period, and 751 B.C.

4th, Verrius Flaccus places it in the fourth year of the sixth Olympiad, that is, in the year 3962 of the Julian period, and 752 B.C.

5th, Terentius Varro places it in the third year of the sixth Olympiad, that is, in the year 3961 of the Julian period, and 753 B.C.

A knowledge of these different computations is necessary, in order to reconcile the Roman historians with one another, and even any one writer with himself. Livy in general adheres to the epoch of Cato, though he sometimes follows that of Fabius Pictor. Cicero follows the account of Varro, which is also in general adopted by Pliny. Dionysius of Halicarnassus follows Cato. Modern chronologers for the most part adopt the account of Varro, which is supported by a passage in Censorinus, where it is stated that the 991st year of Rome commenced with the festival of the Palilia, in the consulship of Ulpian and Pontianus.

Now this consulship corresponded with the 238th year of our era; therefore, deducting 238 from 991, we have 753 to denote the year before Christ. The Palilia commenced on the 21st of April; and all the accounts agree in regarding that day as the epoch of the foundation of Rome.

The Romans employed two sorts of years, the civil year, which was used in the transaction of public and private affairs, and the consular year, according to which the annals of their history have been composed. The civil year commenced with the calends of January, but this did not hold a fixed place in the solar year till the time of Julius Cæsar (see vol. iv. p. 666.) The installation of the consuls regulated the commencement of the consular year. The initial day of the consulate was never fixed, at least before the 7th century of Rome, but varied with the different accidents which in times of political commotion so frequently occurred to accelerate or retard the elections. Hence it happens that a consular year, generally speaking, comprehends a part not only of two Julian years, but also of two civil years. The consulate is the date employed by the Latin historians generally, and by many of the Greeks, down to the 6th century of our era.

In the era of Rome the commencement of the year is placed at the 21st of April; an event therefore which happened in the months of January, February, March, or during the first twenty days of April, in the year (for example) 500 of Rome, belongs to the civil year 501. Before the time of the Decemvirs, however, February was the last month of the year. Many authors confound the year of Rome with the civil year, supposing them both to begin on the 1st of January. Others again confound both the year of Rome and the civil year with the Julian year, which in fact became the civil year after the regulation of the calendar by Julius Cæsar. Through a like want of attention, many writers also, particularly among the moderns, have confounded the Julian and Olympic years, by making an entire Julian year correspond to an entire Olympic year; as if both had commenced at the same epoch. Much attention to these particulars is required in the comparison of ancient dates.

The Christian Era.

The Christian or vulgar era, called also the era of the Incarnation, is now almost universally employed in Christian countries, and is even used by some Eastern nations. Its epoch or commencement is the 1st of January in the fourth year of the 194th Olympiad, the 753d from the foundation of Rome, and the 4714th of the Julian period. It is usually supposed to begin with the year of the birth of Christ, but there are various opinions with regard to the year in which that event took place. This epoch was introduced in Italy in the 6th century, by Dionysius the Little, a Roman abbot, and began to be used in Gaul in the 8th, though it was not generally followed in that country till a century later. From extant charters it is known to have been in use in England before the close of the 8th century. Before its adoption the usual practice in Latin countries was to distinguish the years by their number in the cycle of Indiction.

In the Christian era the years are simply distinguished by the cardinal numbers; those before Christ being marked B.C. (Before Christ), or A.C. (Ante Christum), and those after Christ A.D. (Anno Domini). This method of reckoning time is more convenient than those which employ cycles or periods of any length whatever; but it still fails to satisfy in the simplest manner possible all the conditions that are necessary for registering the succession of events. For, since the commencement of the era is placed at an intermediate period of history, we are compelled to resort to a double manner of reckoning, backward as well

as forward. Some ambiguity is also occasioned by the want of uniformity in the method of numbering the preceding years. Astronomers denote the year which preceded the first of our era by 0, and the year previous to that by 1 B.C.; but chronologers, in conformity with common notions, call the year preceding the era 1 B.C., the previous year 2 B.C., and so on. By reckoning in this manner, there is an interruption in the regular succession of the numbers; and in the years preceding the era, the leap years, instead of falling on the fourth, eighth, twelfth, &c., fall, or ought to fall, on the first, fifth, ninth, &c.

In the chronicles of the Middle Ages much uncertainty frequently arises respecting dates on account of the different epochs assumed for the commencement of the Christian year. Dionysius, the author of the era, adopted the day of the *Annunciation*, or the 25th of March, which preceded the birth of Christ by nine months, as the commencement of the first year of the era. This epoch therefore precedes that of the vulgar era by nine months and seven days. This manner of dating was followed in some of the Italian states, and continued to be used at Pisa even down to the year 1745. It was also adopted in some of the Papal bulls; and there are proofs of its having been employed in France about the middle of the 11th century. Some chroniclers, who adhere to the day of the *Annunciation* as the commencement of the year, reckon from the 25th of March following our epoch, as the Florentines in the 10th century. Gregory of Tours, and some writers of the 6th and 7th centuries, make the year commence sometimes with the 1st of March, and sometimes with the 1st of January. In France, under the third race of kings, it was usual to begin the year with Easter; and this practice continued at least till the middle of the 16th century, for an edict was issued by Charles IX. in the month of January 1663, ordaining that the commencement of the year should thenceforth be considered as taking place on the 1st of January. An instance is given, in *L'Art de Vérifier les Dates*, of a date in which the year is reckoned from the 18th of March; but it is probable that this refers to the astronomical year, and that the 18th of March was taken for the day of the vernal equinox. In Germany, about the 11th century, it was usual to commence the year at Christmas; and this practice also prevailed at Milan, Rome, and other Italian cities, in the 13th, 14th, and 15th centuries.

In England, the practice of placing the beginning of the year at Christmas was introduced in the 7th century, and traces of it are found even in the 13th. Gervase of Canterbury, who lived in the 13th century, mentions that almost all writers of his country agreed in regarding Christmas day as the first of the year, because it forms, as it were, the term at which the sun finishes and recommences his annual course. In the 12th century, however, the custom of beginning the civil year with the day of the *Annunciation*, or the 25th of March, began to prevail, and continued to be generally followed from that time till the reformation of the calendar in 1752. The historical year has always been reckoned by English authors to begin with the 1st of January. The liturgic year of the Church of England commences with the first Sunday of Advent.

A knowledge of the different epochs which have been chosen for the commencement of the year in different countries is indispensably necessary to the right interpretation of ancient chronicles, charters, and other documents in which the dates often appear contradictory. We may cite an example or two. It is well known that Charles the Great was crowned emperor at Rome on Christmas day in the year 800, and that he died in the year 814, according to our present manner of reckoning. But in the annals of Metz and Moissac, the coronation is stated to have taken

place in the year 801, and his death in 813. In the first case the annalist supposes the year to begin with Christmas, and accordingly reckons the 25th of December and all the following days of that month to belong to 801, whereas in the common reckoning they would be referred to the year 800. In the second case the year has been supposed to begin with the 25th of March, or perhaps with Easter; consequently the first three months of the year 814, reckoning from the 1st of January, would be referred to the end of the year 813. The English Revolution is popularly called the Revolution of 1688. Had the year then begun, as it now does, with the 1st of January, it would have been the revolution of 1689, William and Mary being received as king and queen in February in the year 1689; but at that time the year was considered in England as beginning on the 25th of March. Another circumstance to which it is often necessary to pay attention in the comparison of dates, is the alteration of style which took place on the adoption of the Gregorian Calendar (see vol. iv. pp. 671 sqq.)

Era of the Creation of the World.

As the Greek and Roman methods of computing time were connected with certain pagan rites and observances, which the Christians held in abhorrence, the latter began at an early period to imitate the Jews in reckoning their years from the supposed period of the creation of the world. The chronological elements on which both Jews and Christians founded their computations for determining this period were derived from the Old Testament narratives, which have been transmitted to us through three distinct channels. These are the Hebrew text of the Scriptures, the Samaritan text, and the Greek version known as the Septuagint. In respect of chronology, the three accounts are totally irreconcilable with each other; and no conclusive reason can be given for preferring any one of them to another. We have no concurrent testimony with which to compare them; nor is it even known which of them was regarded as the most probable by the Jews themselves, when the books of the Old Testament were revised and transcribed by Ezra. The ordinary rules of probability cannot be applied to a state of things in which the duration of human life is represented as extending to nearly a thousand years.

From computations founded on loose and conflicting data it would be vain to look for knowledge or even for concord of opinion. From the very nature of the case discussion is hopeless labour. The subject is one to which the saying *Quot homines tot sententiæ* applies with almost literal truth. Des Vignoles, in the preface to his *Chronology of Sacred History*, asserts that he collected upwards of two hundred different calculations, the shortest of which reckons only 3483 years between the creation of the world and the commencement of the vulgar era, and the longest 6984. The difference amounts to thirty-five centuries. It suffices, therefore, to point out that the so-called era of the creation of the world is a purely conventional and arbitrary epoch; that, practically, it means the year 4004 B.C.,—this being the date which, under the sanction of Archbishop Ussher's opinion, has won its way, among its hundreds of competitors, into most general acceptance. The reader who is desirous of more detailed information on this subject may consult the first volume of the *Universal History*, or *L'Art de Vérifier les Dates*, avant J. C., p. 9.

Jewish Year and Eras.

Before the departure of the Israelites from Egypt their year commenced at the autumnal equinox; but in order to solemnize the memory of their deliverance, the month of *Nisan* or *Abib*, in which that event took place, and which

falls about the time of the vernal equinox, was afterwards regarded as the beginning of the ecclesiastical or legal year. In civil affairs, and in the regulation of the jubilees and sabbatical years, the Jews still adhere to the ancient year, which begins with the month Tisri, about the time of the autumnal equinox. (On the regulation of the Jewish year, see vol. iv. p. 677.)

After their dispersion, the Jews were constrained to have recourse to the astronomical rules and cycles of the more enlightened heathen, in order that their religious festivals might be observed on the same days in all the countries through which they were scattered. For this purpose they adopted a cycle of eighty-four years, which is mentioned by several of the ancient fathers of the church, and which the early Christians borrowed from them for the regulation of Easter. This cycle seems to be neither more nor less than the Calippic period of seventy-six years, with the addition of a Greek octaeteris, in order to disguise its true source, and give it an appearance of originality. In fact, the period of Calippus containing 27,759 days, and the octaeteris 2922 days (see vol. iv. p. 688), the sum, which is 30,681, is exactly the number of days in eighty-four Julian years. But the addition was very far from being an improvement on the work of Calippus; for instead of a difference of only five hours and fifty-three minutes between the places of the sun and moon, which was the whole error of the Calippic period, this difference, in the period of eighty-four years, amounted to one day, six hours, and forty-one minutes. Bucerius places the commencement of this cycle in the year 162 B.C.; Prideaux in the year 291 B.C. According to the account of Prideaux, the fifth cycle must have commenced in the year 46 of our era; and it was in this year, according to St Prosperus, that the Christians began to employ the Jewish cycle of eighty-four years, which they followed, though not uniformly, for the regulation of Easter, till the time of the Council of Nice.

Soon after the Nicene council, the Jews, in imitation of the Christians, abandoned the cycle of eighty-four years, and adopted that of Meton, by which their lunisolar year is regulated at the present day. This improvement was first proposed by Rabbi Samuel, rector of the Jewish school of Sora in Mesopotamia, and was finally accomplished in the year 360 of our era by Rabbi Hillel, who introduced that form of the year which the Jews at present follow, and which, they say, is to endure till the coming of the Messiah.

Till the 15th century the Jews usually followed the era of the Seleucidæ or of Contracts. Since that time they have generally employed a mundane era, and dated from the creation of the world, which, according to their computation, took place 3760 years and about three months before the commencement of our era. No rule can be given for determining with certainty the day on which any given Jewish year begins, without entering into the minutiae of their irregular and complicated calendar. A table comprising twelve cycles of Jewish years will be found at pp. 678, 679 of vol. iv.

Era of Constantinople.

This era, which is still used in the Greek Church, and was followed by the Russians till the time of Peter the Great, dates from the creation of the world. The Incarnation falls in the year 5509, and corresponds, as in our era, with the fourth year of the 194th Olympiad. The civil year commences with the 1st of September; the ecclesiastical year sometimes with the 21st of March, sometimes with the 1st of April. It is not certain whether the year was considered at Constantinople as beginning with September before the separation of the Eastern and Western empires.

At the commencement of our era there had elapsed 5508

years and four months of the era of Constantinople. Hence the first eight months of the Christian year 1 coincide with the Constantinopolitan year 5509, while the last four months belong to the year 5510. In order, therefore, to find the year of Christ corresponding to any given year in the era of Constantinople, we have the following rule:—If the event took place between the 1st of January and the end of August, subtract 5508 from the given year; but if it happened between the 1st of September and the end of the year, subtract 5509.

Era of Alexandria.

The chronological computation of Julius Africanus was adopted by the Christians of Alexandria, who accordingly reckoned 5500 years from the creation of Adam to the birth of Christ. But in reducing Alexandrian dates to the common era, it must be observed that Julius Africanus placed the epoch of the Incarnation three years earlier than it is placed in the usual reckoning, so that the initial day of the Christian era fell in the year 5503 of the Alexandrian era. This correspondence, however, continued only from the introduction of the era till the accession of Diocletian, when an alteration was made by dropping ten years in the Alexandrian account. Diocletian ascended the imperial throne in the year of Christ 284. According to the Alexandrian computation, this was the year 5787 of the world, and 287 of the Incarnation; but on this occasion ten years were omitted, and that year was thenceforth called the year 5777 of the world, and 277 of the Incarnation. There are, consequently, two distinct eras of Alexandria, the one being used before and the other after the accession of Diocletian. It is not known for what reason the alteration was made; but it is conjectured that it was for the purpose of causing a new revolution of the cycle of nineteen years (which was introduced into the ecclesiastical computation about this time by Anatolius, bishop of Hierapolis) to commence with the first year of the reign of Diocletian. In fact, 5777 being divided by 19 leaves 1 for the year of the cycle. The Alexandrian era continued to be followed by the Copts in the 15th century, and is said to be still used in Abyssinia.

Dates expressed according to this era are reduced to the common era by subtracting 5502, up to the Alexandrian year 5786 inclusive, and after that year by subtracting 5492; but if the date belongs to one of the four last months of the Christian year, we must subtract 5503 till the year 5786, and 5493 after that year.

Mundane Era of Antioch.

The chronological reckoning of Julius Africanus formed also the basis of the era of Antioch, which was adopted by the Christians of Syria, at the instance of Panodorus, an Egyptian monk, who flourished about the beginning of the 4th century. Panodorus struck off ten years from the account of Julius Africanus with regard to the years of the world, and he placed the Incarnation three years later, referring it to the fourth year of the 194th Olympiad, as in the common era. Hence the era of Antioch differed from the original era of Alexandria by ten years; but after the alteration of the latter at the accession of Diocletian, the two eras coincided. In reckoning from the Incarnation, however, there is a difference of seven years, that epoch being placed, in the reformed era of Alexandria, seven years later than in the mundane era of Antioch or in the Christian era.

As the Syrian year began in autumn, the year of Christ corresponding to any year in the mundane era of Antioch is found by subtracting 5492 or 5493 according as the event falls between January and September or from September to January.

Era of Nabonassar.

This era is famous in astronomy, having been generally followed by Hipparchus and Ptolemy. It is believed to have been in use from the very time of its origin; for the observations of eclipses which were collected in Chaldea by Callisthenes, the general of Alexander, and transmitted by him to Aristotle, were for the greater part referred to the commencement of the reign of Nabonassar, founder of the kingdom of the Babylonians. It is the basis of the famous Canon of Kings, also called Mathematical Canon, preserved to us in the works of Ptolemy, which, before the recent astonishing discoveries at Nineveh, was the sole authentic monument of Assyrian and Babylonian history known to us. The epoch from which it is reckoned is precisely determined by numerous celestial phenomena recorded by Ptolemy, and corresponds to Wednesday at mid-day, the 26th of February of the year 747 before Christ. The year was in all respects the same as the ancient Egyptian year. On account of the difference in the length of the Julian and Babylonian years, the conversion of dates according to the era of Nabonassar into years before Christ is attended with considerable trouble. The surest way is to follow a comparative table. Frequently the year cannot be fixed with certainty, unless we know also the month and the day.

The Greeks of Alexandria formerly employed the era of Nabonassar, with a year of 365 days; but soon after the reformation of the calendar by Julius Cæsar, they adopted, like other Roman provincials, the Julian intercalation. At this time the first of Thoth had receded to the 29th of August. In the year 136 of our era, the first of Thoth in the ancient Egyptian year corresponded with the 20th of July, between which and the 29th of August there are forty days. The adoption of the Julian year must therefore have taken place about 160 years before the year 136 of our era (the difference between the Egyptian and Julian years being one day in four years), that is to say, about the year 25 B.C. In fact, the first of Thoth corresponded with the 29th of August in the Julian calendar, in the years 25, 24, 23, and 22 B.C.

Era of the Seleucidæ, or Macedonian Era.

The era of the Seleucidæ dates from the time of the occupation of Babylon by Selencus Nicator, 311 years before Christ, in the year of Rome 442, and twelve years after the death of Alexander the Great. It was adopted not only in the monarchy of the Seleucidæ but in general in all the Greek countries bordering on the Levant, was followed by the Jews till the 15th century, and is said to be used by some Arabians even at the present day. By the Jews it was called the *Era of Contracts*, because the Syrian governors compelled them to make use of it in civil contracts; the writers of the books of Maccabees call it the *Era of Kings*. But notwithstanding its general prevalence in the East for many centuries, authors using it differ much with regard to their manner of expressing dates, in consequence of the different epochs adopted for the commencement of the year. Among the Syrian Greeks the year began with the month Elul, which corresponds to our September. The Nestorians and Jacobites at the present day suppose it to begin with the following month, or October. The author of the first book of Maccabees makes the era commence with the month Nisan, or April; and the author of the second book with the first Tishrin, or October. Albategni, a celebrated Arabian astronomer, dates from the 1st of October. Some of the Arabian writers, as Alfergani, date from the 1st of September. At Tyre the year was counted from the 19th of our October, at Gaza from the 28th of the same month, and at Damascus from the vernal equinox. These discrepancies

render it extremely difficult to determine the exact correspondence of Macedonian dates with those of other eras; and the difficulty is rendered still greater by the want of uniformity in respect of the length of the year. Some authors who follow the Macedonian era, use the Egyptian or vague year of 365 days; Albategni adopts the Julian year of 365½ days.

According to the computation most generally followed, the year 312 of the era of the Seleucidæ began on the 1st of September in the Julian year preceding the first of our era. Hence, to reduce a Macedonian date to the common era, subtract 311 years and four months.

The names of the Syrian and Macedonian months, and their correspondence with the Roman months, are as follows:—

Syrian.	Macedonian.	English.
Elul.	Gorpæus.	September.
Tishrin I.	Hyperberetæus.	October.
Tishrin II.	Dius.	November.
Canun I.	Apellæus.	December.
Canun II.	Audynæus.	January.
Sabat.	Peritius.	February.
Adar.	Dystrus.	March.
Nisan.	Xanthicus.	April.
Ayar.	Artemisius.	May.
Haziran.	Dæsius.	June.
Tamuz.	Panemus.	July.
Ab.	Lois.	August.

Era of Alexander.

Some of the Greek historians have assumed as a chronological epoch the death of Alexander the Great, which took place in the year 325 B.C. The form of the year is the same as in the preceding era. This era has not been much followed; but it requires to be noticed in order that it may not be confounded with the era of the Seleucidæ.

Era of Tyre.

The era of Tyre is reckoned from the 19th of October, or the beginning of the Macedonian month Hyperberetæus, in the year 126 B.C. In order, therefore, to reduce it to the common era, subtract 125; and when the date is B.C., subtract it from 126. Dates expressed according to this era occur only on a few medals, and in the acts of certain councils.

Cæsarean Era of Antioch.

This era was established to commemorate the victory obtained by Julius Cæsar on the plains of Pharsalia, on the 9th of August in the year 48 B.C., and the 706th of Rome. The Syrians computed it from their month Tishrin I.; but the Greeks threw it back to the month Gorpæus of the preceding year. Hence there is a difference of eleven months between the epochs assumed by the Syrians and the Greeks. According to the computation of the Greeks, the 49th year of the Cæsarean era began in the autumn of the year preceding the commencement of the Christian era; and, according to the Syrians, the 49th year began in the autumn of the first year of the Incarnation. It is followed by Evagrius in his *Ecclesiastical History*.

Julian Era.

The Julian era commences with the 1st of January, forty-five years B.C. It was designed to commemorate the reformation of the Roman calendar by Julius Cæsar.

Era of Spain, or of the Cæsars.

The conquest of Spain by Augustus, which was completed in the thirty-ninth year B.C., gave rise to this era, which began with the first day of the following year, and was long used in Spain and Portugal, and generally in all the Roman provinces subdued by the Visigoths, both in Africa and the South of France. Several of the councils

of Carthage, and also that of Arles, are dated according to this era. After the 9th century it became usual to join with it in public acts the year of the Incarnation. It was followed in Catalonia till the year 1180, in the kingdom of Aragon till 1350, in Valencia till 1358, and in Castile till 1382. In Portugal it is said to have been in use so late as the year 1415, or 1422, though it would seem that after the establishment of the Portuguese monarchy, no other era was used in the public acts of that country than that of the Incarnation. As the era of Spain commenced with the 1st of January, and the months and days of the year are those of the Julian calendar, any date is reduced to the common era by subtracting thirty-eight from the number of the year.

Era of Actium, and Era of Augustus.

This era was established to commemorate the battle of Actium, which was fought on the 3d of September, in the year 31 B.C., and in the 15th of the Julian era. By the Romans the era of Actium was considered as commencing on the 1st of January of the 16th of the Julian era, which is the 30th B.C. The Egyptians, who used this era till the time of Diocletian, dated its commencement from the beginning of their month Thoth, or the 29th of August; and the Eastern Greeks from the 2d of September. By the latter it was also called the era of Antioch, and it continued to be used till the 9th century. It must not be confounded with the Cæsarean era of Antioch, which began seventeen years earlier. Many of the medals struck by the city of Antioch in honour of Augustus are dated according to this era.

Besides the era of Actium, there was also an Augustan era, which commenced four years later, or 27 B.C., the year in which Augustus prevailed on the senate and people of Rome to decree him the title of Augustus, and to confirm him in the supreme power of the empire.

Era of Diocletian, or Era of Martyrs.

It has been already stated that the Alexandrians, at the accession of the Emperor Diocletian, made an alteration in their mundane era, by striking off ten years from their reckoning. At the same time they established a new era, which is still followed by the Abyssinians and Copts. It commences with the 29th of August (the first day of the Egyptian year) of the year 284 of our era, which was the first of the reign of Diocletian. The denomination of *Era of Martyrs*, subsequently given to it in commemoration of the persecution of the Christians, would seem to imply that its commencement ought to be referred to the year 303 of our era, for it was in that year that Diocletian issued his famous edict; but the practice of dating from the accession of Diocletian has prevailed. The ancient Egyptian year consisted of 365 days; but after the introduction of the Julian calendar, the astronomers of Alexandria adopted an intercalary year, and added six additional days instead of five to the end of the last month of every fourth year. The year thus became exactly similar to the Julian year. The Egyptian intercalary year, however, does not correspond to the Julian leap year, but is the year immediately preceding; and the intercalation takes place at the end of the year, or on the 29th of August. Hence the first three years of the Egyptian intercalary period commence on the 29th of our August, and the fourth commences on the 30th of that month. Before the end of that year the Julian intercalation takes place, and the beginning of the following Egyptian year is restored to the 29th of August. Hence to reduce a date according to this era to our own reckoning, it is necessary, for common years, to add 283 years and 240 days; but if the date belongs to the first three months of the year

following the intercalation, or, which is the same thing, if in the third year of the Julian cycle it falls between the 30th of August and the end of the year, we must add 283 years and 241 days. The Ethiopians do not reckon the years from the beginning of the era in a consecutive series, but employ a period of 532 years, after the expiration of which they again begin with 1. This is the Dionysian or Great Paschal Period, and is formed by the multiplication of the numbers 28 and 19, that is, of the solar and lunar cycles, into each other.

The following are the names of the Ethiopian or Abyssinian months, with the days on which they begin in the Julian calendar, or old style:—

Mascaram.....	29th August.	Magabit.....	25th February.
Tikmith.....	28th September.	Miazia	27th March.
Hadar	28th October.	Gimbot.....	26th April.
Tacsam	27th November.	Sene	26th May.
Tir	27th December.	Hamle.....	25th June.
Yacatit	26th January.	Nahasse.....	25th July.

The additional or epagomenal days begin on the 24th of August. In intercalary years the first seven months commence one day later. The Egyptian months, followed by the modern Copts, agree with the above in every respect excepting the names.

Indiction.

The cycle of Indiction, already explained at p. 670 of vol. iv., was very generally followed in the Roman empire for some centuries before the adoption of the Christian era. Three Indictions may be distinguished; but they differ only in regard to the commencement of the year.

1. The *Constantinopolitan Indiction*, like the Greek year, commenced with the month of September. This was followed in the Eastern empire, and in some instances also in France.

2. The *Imperial or Constantinian Indiction* is so called because its establishment is attributed to Constantine. This was also called the *Cæsarean Indiction*. It commences on the 24th of September. It is not unfrequently met with in the ancient chronicles of France and England.

3. The *Roman or Pontifical Indiction* began on the 25th of December or 1st of January, according as the Christian year was held to commence on the one or other of these days. It is often employed in papal bulls, especially after the time of Gregory VII., and traces of its use are found in early French authors.

Era of the Armenians.

The epoch of the Armenian era is that of the Council of Tiber, in which the Armenians consummated their schism from the Greek Church by condemning the acts of the Council of Chalcedon; and it corresponds to Tuesday, the 9th of July of the year 552 of the Incarnation. In their civil affairs the Armenians follow the ancient vague year of the Egyptians; but their ecclesiastical year, which begins on the 11th of August, is regulated in the same manner as the Julian year, every fourth year consisting of 366 days, so that Easter and the other festivals are retained at the same place in the seasons as well as in the civil year. The Armenians also make use of the mundane era of Constantinople, and sometimes conjoin both methods of computation in the same documents. In their correspondence and transactions with Europeans, they generally follow the era of the Incarnation, and adopt the Julian year.

To reduce the civil dates of the Armenians to the Christian era, proceed as follows. Since the epoch is the 9th of July, there were 176 days from the beginning of the Armenian era to the end of the year 552 of our era; and since 552 was a leap year, the year 553 began a Julian intercalary period. Multiply, therefore, the number of

Armenian years elapsed by 365; add the number of days from the commencement of the current year to the given date; subtract 176 from the sum, and the remainder will be the number of days from the 1st of January 553 to the given date. This number of days being reduced to Julian years, add the result to 552, and the sum gives the day in the Julian year, or old style.

In the ecclesiastical reckoning the year begins on the 11th of August. To reduce a date expressed in this reckoning to the Julian date, add 551 years, and the days elapsed from the 1st of January to the 10th of August, both inclusive, of the year 552,—that is to say (since 552 is a leap year), 223 days. In leap years, one day must be subtracted if the date falls between the 1st of March and 10th of August.

The following are the Armenian ecclesiastical months with their correspondence with those of the Julian calendar:—

1. Navazardi begins.....	11th August.
2. Hori.....	10th September.
3. Sahomi.....	10th October.
4. Dre Thari.....	9th November.
5. Kagoths.....	9th December.
6. Aracz.....	8th January.
7. Malegi.....	7th February.
8. Areki.....	9th March.
9. Angi.....	8th April.
10. Mariri.....	8th May.
11. Marcacz.....	7th June.
12. Herodiez.....	7th July.

To complete the year, five complementary days are added in common years, and six in leap years.

The Mahometan Era, or Era of the Hegira.

The era in use among the Turks, Arabs, and other Mahometan nations is that of the *Hegira* or *Hejra*, the flight of the prophet from Mecca to Medina, 622 A.D. Its commencement, however, does not, as is sometimes stated, coincide with the very day of the flight, but precedes it by sixty-eight days. The prophet, after leaving Mecca, to escape the pursuit of his enemies, the Koreishites, hid himself with his friend Abubekr in a cave near Mecca, and there lay for three days. The departure from the cave and setting out on the way to Medina is assigned to the ninth day of the third month, Rabia I.—corresponding to the 22d of September of the year 622 A.D. The era begins from the first day of the month of Moharram preceding the flight, or first day of that Arabian year, which coincides with Friday, July 16, 622 A.D. It is necessary to remember that by astronomers and by some historians the era is assigned to the preceding day, July 15. It is stated by D'Herbelot that the era of the Hegira was instituted by Omar, the second caliph, in imitation of the Christian era of the martyrs. (For details of the Mahometan year, names and length of months, and for the method of reduction of Mahometan dates to Christian, see vol. iv. pp. 679–681).

Era of Yezdegird, or Persian or Gelalwan Era.

This era commences with the elevation of Yezdegird III. to the throne of Persia, on the 16th of June in the year of our era 632. Till the year 1079 the Persian year resembled that of the ancient Egyptians, consisting of 365 days without intercalation; but at that time the Persian calendar was reformed by Gelal-ed-din Malek Shah, sultan of Khorasan, and a method of intercalation adopted which, though less convenient, is considerably more accurate than the Julian. The intercalary period is 33 years,—one day being added to the common year seven times successively at the end of four years, and the eighth intercalation being deferred till the end of the fifth year (see vol. iv. p. 667). This era was at one period universally adopted in Persia,

and it still continues to be followed by the Parsees of India. The months consist of thirty days each, and each day is distinguished by a different name. According to Alfargani, the names of the Persian months are as follows:—

Afrudin-meh.	Mended-meh.	Adar-meh.
Ardiascht-meh.	Schaharir-meh.	Di-meh.
Cardi-meh.	Mahar-meh.	Behen-meh.
Tir-meh.	Aben-meh.	Alirer-meh.

The five additional days (in intercalary years six) are named *Musteraca*.

As it does not appear that the above-mentioned rule of intercalation was ever regularly followed, it is impossible to assign exactly the days on which the different years begin. In some provinces of India the Parsees begin the year with September, in others they begin it with October. We have stated that the era began with the 16th June 632. But the vague year, which was followed till 1079, anticipated the Julian year by one day every four years. In 447 years the anticipation would amount to about 112 days, and the beginning of the year would in consequence be thrown back to near the beginning of the Julian year 632. To the year of the Persian era, therefore, add 631, and the sum will be the year of our era in which the Persian year begins.

Chinese Chronology.

From the time of the Emperor Yaou, upwards of 2000 years B.C., the Chinese had two different years,—a civil year, which was regulated by the moon, and an astronomical year, which was solar. The civil year consisted in general of twelve months or lunations, but occasionally a thirteenth was added, in order to preserve its correspondence with the solar year. Even at that early period the solar or astronomical year consisted of 365½ days, like our Julian year; and it was arranged in the same manner, a day being intercalated every fourth year.

According to the missionary Gaubil, the Chinese divided the day into 100 *ke*, each *ke* into 100 minutes, and each minute into 100 seconds. This practice continued to prevail till the 17th century, when, at the instance of the Jesuit Schall, president of the tribunal of mathematics, they adopted the European method of dividing the day into twenty-four hours, each hour into sixty minutes, and each minute into sixty seconds. The civil day commences at midnight and ends at the midnight following.

Since the accession of the emperors of the Han dynasty, 206 B.C., the civil year of the Chinese has begun with the first day of that moon in the course of which the sun enters into the sign of the zodiac which corresponds with our sign Pisces. From the same period also, they have employed, in the adjustment of their solar and lunar years, a period of nineteen years, twelve of which are common, containing twelve lunations each, and the remaining seven intercalary, containing thirteen lunations. It is not, however, precisely known how they distributed their months of thirty and twenty-nine days, or, as they termed them, great and small moons. This, with other matters appertaining to the calendar, was probably left to be regulated from time to time by the mathematical tribunal.

The Chinese divide the time of a complete revolution of the sun with regard to the solstitial points into twelve equal portions, each corresponding to thirty days, ten hours, thirty minutes. Each of these periods, which is denominated a *tsë*, is subdivided into two equal portions called *chung-ki* and *tsie-ki*, the *chung-ki* denoting the first half of the *tsë*, and the *tsie-ki* the latter half. Though the *tsë* are thus strictly portions of solar time, yet, what is remarkable, though not peculiar to China, they give their name to the lunar months, each month or lunation having the

name of the *chung-ki* or sign at which the sun arrives during that month. As the *tsë* is longer than a synodic revolution of the moon, the sun cannot arrive twice at a *chung-ki* during the same lunation; and as there are only twelve *tsë*, the year can contain only twelve months having different names. It must happen sometimes that in the course of a lunation the sun enters into no new sign; in this case the month is intercalary, and is called by the same name as the preceding month.

For chronological purposes, the Chinese, in common with some other nations of the east of Asia, employ cycles of sixty, by means of which they reckon their days, moons, and years. The days are distributed in the calendar into cycles of sixty, in the same manner as ours are distributed into weeks, or cycles of seven. Each day of the cycle has a particular name, and as it is a usual practice, in mentioning dates, to give the name of the day along with that of the moon and the year, this arrangement affords great facilities in verifying the epochs of Chinese chronology. The order of the days in the cycle is never interrupted by any intercalation that may be necessary for adjusting the months or years. The moons of the civil year are also distinguished by their place in the cycle of sixty; and as the intercalary moons are not reckoned, for the reason before stated, namely, that during one of these lunations the sun enters into no new sign, there are only twelve regular moons in a year, so that the cycle is renewed every five years. Thus the first moon of the year 1873 being the first of a new cycle, the first moon of every sixth year, reckoned backwards or forwards from that date, as 1868, 1863, &c., or 1877, 1882, &c., will also commence a new lunar cycle of sixty moons. In regard to the years, the arrangement is exactly the same. Each has a distinct number or name which marks its place in the cycle, and as this is generally given in referring to dates, along with the other chronological characters of the year, the ambiguity which arises from following a fluctuating or uncertain epoch is entirely obviated. The present cycle began in the year 1864 of our era; the year 1876 is consequently the 13th of the current cycle.

The cycle of sixty is formed of two subordinate cycles or series of characters one of ten and the other of twelve, which are joined together so as to afford sixty different combinations. The names of the characters in the cycle of ten, which are called *celestial signs*, are—

1. Kcä; 2. Yih; 3. Ping; 4. Ting; 5. Woo;
 6. Ke; 7. Käng; 8. Sin; 9. Jin; 10. Kwei;
- and in the series of 12, denominated *terrestrial signs*,
1. Tsze; 2. Chow; 3. Yin; 4. Maou; 5. Shin; 6. Sze;
 7. Woo; 8. We; 9. Shin; 10. Yew; 11. Seih; 12. Hac.

The name of the first year, or of the first day, in the sexagenary cycle is formed by combining the first words in each of the above series; the second is formed by combining the second of each series, and so on to the tenth. For the next year the first word of the first series is combined with the eleventh of the second, then the second of the first series with the twelfth of the second, after this the third of the first series with the first of the second, and so on till the sixtieth combination, when the last of the first series concurs with the last of the second. Thus Kei-tsze is the name of the first year, Yih-chow that of the second, Kei-senh that of the eleventh, Yih-hae that of the twelfth, Ping-tsze that of the thirteenth, and so on. The order of proceeding is obvious.

In the Chinese history translated into the Tatar dialect by order of the emperor Kang-he, who died in 1721, the characters of the cycle begin to appear at the year 2357 B.C. From this it has been inferred that the Chinese empire was established previous to that epoch; but it is obviously so easy to extend the cycles backwards indefinitely,

that the inference can have very little weight. The characters given to that year 2357 B.C. are Kei-shin, which denote the 41st of the cycle. We must, therefore, suppose the cycle to have begun 2397 B.C., or forty years before the reign of Yaou. This is the epoch assumed by the authors of *L'Art de Vérifier les Dates*. The mathematical tribunal has, however, from time immemorial counted the first year of the first cycle from the eighty-first of Yaou, that is to say, from the year 2277 B.C.

Since the year 163 B.C. the Chinese writers have adopted the practice of dating the year from the accession of the reigning emperor. An emperor, on succeeding to the throne, gives a name to the years of his reign. He ordains, for example, that they shall be called Ta-te. In consequence of this edict, the following year is called the first of Ta-te, and the succeeding years the second, third, fourth, &c., of Ta-te, and so on, till it pleases the same emperor or his successor to ordain that the years shall be called by some other appellation. The periods thus formed are called by the Chinese Nien-hao. According to this method of dating the years a new era commences with every reign; and the year corresponding to a Chinese date can only be found when we have before us a catalogue of the Nien-hao, with their relation to the years of our era.

The Chinese chronology is discussed with ample detail by Freret, in the *Memoirs of the Academy of Inscriptions*, tom. xviii.; and an abridgment of his memoir is given in *L'Art de Vérifier les Dates* (tom. ii. p. 284, *et seq.*; ed. in 4to, 1818), from which the preceding account is principally taken.

Indian Chronology.

The method of dividing and reckoning time followed by the various nations of India resembles in its general features that of the Chinese, but is rendered still more complex by the intermixture of Mahometan with Hindu customs. Like the Chinese, the Hindus have a solar year, which is generally followed in the transaction of public business, especially since the introduction of European power; and they have also a lunar year, which regulates their religious festivals, and which they follow in their domestic arrangements. Their solar year, or rather sidereal year, is measured by the time in which the sun returns to the same star, and is consequently longer than our astronomical year, by the whole quantity of the precession of the equinoxes. It is reckoned by the Hindus at 365 days, 6 hours, 12 minutes, 30 seconds, and consequently exceeds a Gregorian year by one day in sixty years. The Indian zodiac is divided into twelve solar and twenty-eight lunar signs; and the year begins with the sun's arrival at the first degree of the first sign. The month is the time the sun takes to pass through one sign; and as each sign contains the same number of degrees, the months vary somewhat in length, according as the sun is nearer the apogee or the perigee. The longest month may contain 31 days, 14 hours, 39 minutes, and the shortest only 29 days, 8 hours, 21 minutes. The civil months, however, depend solely on the moon; though, with the same perversion of ingenuity which we have already remarked with regard to the Chinese, and of which it would be difficult to find an example except in the east of Asia, they derive their names from the solar signs of the zodiac. The first civil month commences with the day after the full moon of that lunation in the course of which the sun enters the first Hindu sign, and so on with the others. When the sun enters into no new sign during the course of a lunation, the month is intercalary, and is called by the name of that which precedes or follows it, which some prefix to distinguish it from the regular month. In some provinces of India, as in Bengal, the civil month commences with the day after the

new moon; but in the upper or northern provinces, it begins, as we have stated, with the day after the full moon. From the manner in which they are reckoned, it is evident that the Hindu months, both solar and lunar, neither consist of an entire number of days, nor are regulated by any cycle, but depend solely on the motion of the sun and moon. The time of their commencement is different on every different meridian; and a Hindu has no means of knowing beforehand on what day any month begins, excepting by consulting his almanac. The civil day in all parts of India begins at sunrise.

The Hindu eras have been the subject of much controversy. According to the dreams of Indian mythology, the duration of the world is limited to four *yugs* or ages, three of which have already passed, and the fourth, which is the *kali-yug*, is the last and most deteriorated. It is this only which has any reference to authentic chronology. It forms the principal era of India, and comprehends several others in common use, as the era of Viceramaditya, the era of Salivahana, the Bengalee era, and the cycle of sixty years.

The *Kali-yug* commenced in the year 3101 B.C. The year is sidereal, and begins when the sun enters the first sign of the Hindu zodiac, which at present happens about the 11th of April. Owing to the precession of the equinoxes the beginning of the year advances in the seasons at the rate of about one day in sixty years.

The *Era of Viceramaditya* is reckoned from the year 57 B.C., which corresponds to 3044 of the *Kali-yug*. This era, the years of which are called *Samvat*, prevails chiefly in the higher or northern provinces of India, and in Guzerat. Its name is derived from that of a sovereign of Malwa, who, by defeating Saka, king of Delhi, acquired possession of the principal throne of India. Whether the year from which it is reckoned was that of the accession or death of this prince is uncertain. The years are reckoned in the same manner as those of the *Kali-yug*; and it may be remarked of the Indian eras in general that, though some of them profess to be counted from the deaths of their kings, or other historical events, they all commence at the time the sun reaches the same point in his annual course through the zodiac.

The *Era of Salivahana* is the year 78 A.D., which corresponds to 3179 of the *Kali-yug*, and 135 of the *Viceramaditya*. The name is derived from Salivahan, who is said to have reigned many years over the kingdom of Narsinga, and to have been a liberal encourager of the arts and sciences. It is generally used in records or writings of importance, but is most prevalent in the southern provinces of Hindustan. The years are called *Saka*.

The *Fuslee Era*, from the near coincidence of its dates with those of the Hegira, seems to have been imposed on the natives of India by their Mahometan conquerors. It is principally used in revenue transactions, and is pretty generally known over India. There are several eras of this name; but the most common is that which is reckoned from the year 590 A.D. At Madras the commencement of the *Fuslee* year is fixed on the 12th of July. In Bengal it begins in September, or with the full moon preceding the autumnal equinox.

The *Bengalee Era* is also supposed to be derived from the Hegira; but the year is measured by solar time, and therefore differs entirely from the Mahometan year, which is purely lunar. At the present time the Bengalee epoch is about nine years later than the Hegira,—the year 1245 of the Hegira having commenced in July 1829, and the Bengalee year 1236 in April 1829. The sidereal year exceeds the lunar year by 10 days 21½ hours nearly; consequently, by reckoning backwards, it will be found that the dates of the Bengalee era and of the Hegira coincided

about the middle of the 16th century. History is silent on the subject; but it seems probable, that though the epoch of the Hegira was partially adopted in India, the Hindus pertinaciously resisted all attempts to disturb their ancient methods of reckoning the subdivisions of the year.

Besides the Indian eras here enumerated, there are some others which are less generally known, or which are followed only in particular provinces. The cycle of sixty years is also sometimes used, particularly in connection with the era of Viceramaditya. According to the Bengal account, the first cycle began 3185 years B.C.; and the year 1876 of our era is consequently the twenty-first of the eighty-fifth cycle. In the Telinga account the first cycle began 3114 B.C.; and the year 1876 is the tenth of the eighty-fourth cycle.

Fuller information regarding Indian chronology will be found in Prinsep's *Essays on Indian Antiquities* (1858), vol. ii., Warren's *Kala Sankalita* (1825), and Burnett's *Elements of South Indian Palæography* (1874).

Principal Works on Chronology.

To meet the wants of those who may desire to enter more fully into chronological studies, we subjoin a list of the leading works on the subject. In addition to the early Greek writings already named, there are the forty books (some fifteen only extant in their entirety) of universal history compiled (about 8 B.C.) by Diodorus Siculus, and arranged in the form of annals; the *Pentabiblos* of Julius Africanus (about 220–230 A.D.); the treatise of Censorinus entitled *De die natali*, written 238 A.D.; the *Chronicon*, in two books, of Eusebius Pamphili, bishop of Cæsarea (about 325 A.D.), distinguished as the first book of a purely chronological character which has come down to us; and three important works forming parts of the *Corpus Scriptorum Historiæ Byzantinæ*, namely, the *Chronographia* of Georgius Syncellus (800 A.D.), the *Chronographia* of Johannes Malalas (9th century), and the *Chronicon Paschale*.

Among the very numerous modern works on Chronology, the most important are the following, which are arranged in the order of their publication:—

1583. *De Emendatione Temporum*, by Joseph Scaliger, in which were laid the foundations of modern chronological science.
1603. *Opus Chronologicum*, by Sethus Calvisius.
1627. *De Doctrina Temporum*, by Petavius (Denis Petau), with its continuation published in 1630, and an abridgment entitled *Rationarium Temporum*, in 1633–1634.
1650. *Annales Veteris et Novi Testamenti*, by Archbishop Ussher, whose dates have by some means gained a place in the authorized version of the Bible.
1651. *Regiæ Epitome Historiæ Sacræ et Profanæ*, by Philippe Labbe, of which a French version was also published.
1669. *Institutionum Chronologicarum libri duo*, by Bishop Beveridge.
1672. *Chronicus Canon Ægyptiacus, Ebraicus, et Græcus*, by Sir John Marsham.
1687. *L'Antiquité des Temps rétablie et défendue*, by Paul Pezron, with its *Défense*, 1691.
1701. *De Veteribus Græcorum Romanorumque Cyclis*, by Henry Dodwell.
1728. *The Chronology of Ancient Kingdoms amended*, by Sir Isaac Newton, remarkable as an attempt to construct a system on new bases, independent of the Greek chronologists.
1738. *Chronologie de l'Histoire sainte*, by Alphonse des Vignolles.
1744. *Tablettes chronologiques de l'Histoire universelle*, by N. Lenglet-Dufresnoy.
1750. The first edition in one vol. 4to of *L'Art de Vérifier les Dates*, which in its third edition (1818–1831) appeared in 38 vols. 8vo., a colossal monument of the learning and labours of various members of the Benedictine Congregation of Saint-Maur.
1752. *Chronological Antiquities*, by John Jackson.
1754. *Chronology and History of the World*, by John Blair; new edition, much enlarged, 1857.
1784. *A System of Chronology*, by Playfair.

1799. *Handbuch der Geschichte der Staaten des Alterthums*, by A. H. L. Heeren.
 1803. *Handbuch der alten Geschichte, Geographie, und Chronologie*, by G. G. Bredow, with his *Historische Tabellen*.
 1809-1814. *New Analysis of Chronology*, by William Hales.
 1819. *Annales Veterum Regnorum*, by C. G. Zumpt.
 1821. *Tableaux historiques, chronologiques, et géographiques*, by Buret de Longchamps.
 1824-1834. *Fasti Hellenici*, and 1845-1850, *Fasti Romani*, by H. Fynes Clinton. Epitomes of these elaborate works were published, 1851-1853.
 1825-1826. *Handbuch der mathematischen und technischen Chronologie*, by Christian Ludwig Ideler; and his *Lehrbuch der Chronologie*, 1831.
 1833. *The Chronology of History*, by Sir Harris Nicolas.
 1852. *Fasti Temporis Catholici*, by Edward Greswell; and by the same author, 1854, *Origines Kalendariæ Italianæ*; and 1862, *Origines Kalendariæ Hellenicæ*.
 1865. *Fasti Sacri*, a key to the chronology of the New Testament, by Thomas Lewin.
 1869. *Manual of Ancient History*, by G. Rawlinson.

CHRONOLOGICAL TABLE

Of the principal events of political and military history, with notices of great men and famous books, and of the most important inventions and discoveries, from the earliest times to the close of the year 1875.

Chronological tables, however unattractive to minds whose inclinations or occupations do not lie in the direction of them, are of much value and real interest for those who have knowledge and occasion to make a right use of them. To the historical student they not only serve as a storehouse of individual facts with dates, but by the orderly juxtaposition and sequence of these they indicate relations. They are maps on which are delineated or suggested the lines of the main currents in the ocean of human history. When the student, engaged on any special series of events, desires to find their place and surroundings in world-history, he has but to turn to such tables, and a glance or two will inform him.

In the preparation of the subjoined table great pains have been taken to bring it as closely as possible into agreement with the results of recent historical and chronological determinations. Events and dates of purely legendary character, once accepted as historical facts with unquestioning acquiescence, have no place in it; and the whole has been subjected to a searching examination and comparison with the best sources of information. The conflict of the authorities makes absolute certainty in many cases unattainable. The reader will therefore remember in using the table, that, as differences and authorities cannot be given, the dates are necessarily in some cases approximate or probable only.

2234. B.C. Alleged beginning of Chaldean astronomical observations sent by Callisthenes to Aristotle; the earliest extant is of 720 B.C.
 2200 (*circa*). The Hia dynasty in China founded.
 2000 (*circa*). Cuneiform writing probably in use (deciphered by Grotefend, 1802 A.D.)
 1582. Beginning of chronology of Arundelian (Parian) marbles. (Brought to England, 1627 A.D.)
 1500 (*circa*). Date of the oldest papyri extant.
 1273. Rise of Assyrian empire, according to Rawlinson.
 1150 (*circa*). Cylinder inscription of Tiglath-Pileser, king of Assyria (deciphered, 1857 A.D.)
 1100 (*circa*). The Chow dynasty in China founded.
 1055. David king of Israel.
 1012. Building of Solomon's Temple.
 999-959. Capture of Jerusalem by Shishank (Shishak), king of Egypt, in this period.

- 909 B.C. Commencement of Assyrian canon, which terminates 640 B.C. (Discovered and published by Rawlinson, 1862 A.D.)
 900. Erection of North-West Palace of Nimroud, according to Layard.
 884 (?). Legislation of Lycurgus at Sparta.
 776. Olympiad of Coræbus. The first authentic date in Greek history.
 770. Invasion of Palestine by Pul, king of Assyria.
 753. Foundation of Rome, according to Varro.
 747. Babylon independent under Nabonassar.
 743-723. First Messenian war.
 727. Religious reformation under Hezekiah, king of Judah.
 721. Samaria taken by Sargon, king of Assyria. Overthrow of the kingdom of Israel. Captivity of the ten tribes.
 711 (*circa*). Invasion of Judah by Sennacherib.
 685-668. Second Messenian war, under Aristomenes.
 684. Archonship at Athens made annual.
 667-625. Reign of Assur-bani-pal, king of Assyria.
 659. Foundation of Byzantium by Megarians.
 640. Religious reformation under Josiah, king of Judah.
 632. Invasion of Assyria by Scythians.
 625 (606 ?). Fall of Nineveh. Babylon independent under Nabopolassar.
 624. Legislation of Draco, archon at Athens.
 610. Battle of Megiddo. Death of Josiah.
 598. Siege and capture of Jerusalem by Nebuchadnezzar. Second captivity.
 594. Legislation of Solon, archon at Athens.
 588. The Pythian games begin to be celebrated every five years.
 585. Death of Periander, tyrant of Corinth forty years. Eclipse of the sun, predicted by Thales (?).
 579. Tyre taken by Nebuchadnezzar.
 569. Nebuchadnezzar's conquest of Egypt.
 560. Pisistratus tyrant of Athens (died, 527).
 559. Anacreon begins to be known (still living in 529).
 556. Birth of Simonides (died, 467).
 554 (?). Conquest of Lydia and capture of Cræsus by Cyrus, king of Persia.
 549. Death of Phalaris tyrant of Agrigentum.
 540-510 (?). Pythagoras flourished.
 538. Babylon taken by Cyrus. The Jews soon after return to Judea.
 536. The Jews, under Zerubbabel, begin to rebuild the Temple.
 535. Thespis first exhibits tragedy.
 532. Polycrates tyrant of Samos (put to death, 522).
 529. Death of Cyrus. Accession of Cambyses.
 525. Battle of Pelusium. Conquest of Egypt by Cambyses.
 Birth of Æschylus (died, 456).
 521-485. Reign of Darius Hystaspis, king of Persia. Inscription of Behistun (translated by Rawlinson, 1846 A.D.)
 520. Decree of Darius for rebuilding the Temple at Jerusalem.
 518. Birth of Pindar (died, 439).
 510. The Pisistratidæ expelled from Athens. Democratic Government restored.
 508. First treaty between Rome and Carthage.
 507, 506. Conquest of Thrace, Pæonia, and Macedonia by Darius.
 500. Burning of Sardis by the Ionians and Athenians.
 497. Battle of Lake Regillus. First authentic date in Roman history.
 495. Birth of Sophocles (died, 406).
 492. First Persian expedition, under Mardonius, against Greece.
 490. Second Persian expedition, under Datis and Artaphernes. Victory of Miltiades at Marathon.
 485. Accession of Xerxes, king of Persia. Gelon, tyrant of Syracuse.
 484. Recovery of Egypt by the Persians. Birth of Herodotus (died, after 409).
 483. Ostracism of Aristides the Just by the Athenians.

Colenso's *Pentateuch critically examined* published. George Eliot's *Romola*. Renan's *Vie de Jésus*.

1864. Sir John Lawrence viceroy of India, January 12. German ultimatum presented to Denmark, January 16. Austro-Prussian army enters Holstein, January 21. Evacuation of the Dannewerk, February 6. Visit of Garibaldi to England, April 3-27. Seizure of Chincha Islands by Spain, April 14. Capture of Düppel by Prussians, April 18. Russian conquest of Circassia completed. Death of Meyerbeer, May 2 (born, 1794). Suspension of hostilities in Schleswig, May 12. Death of N. Hawthorne, May 19 (born, 1804). Cession of Ionian Islands to Greece, May 28. Arrival of the emperor Maximilian in Mexico, May 29. The "Alabama" sunk by the "Kearsage," off Cherbourg, June 19. Hostilities resumed in Denmark, June 26. Naunking taken from the Taepings, July 19; end of the rebellion. Repeal of Fugitive Slave Law, U.S., June 23. Belfast Orange riots, August 8-16. Occupation of Atlanta by Federals, September 2. Evacuation of Rome by the French in two years agreed to, September 15. Death of W. S. Landor, September 17 (born, 1775). Treaty of peace between Denmark, Prussia, and Austria signed at Vienna, October 30 (ratified, November 16). Nevada admitted a State of the Union, October 31. Death of David Roberts, R.A., November 25 (born, 1796). Savannah occupied by General Sherman, December 21. Geneva Convention for relief of the wounded in war originated. Dynamite introduced by Nobel. Tennyson's *Enoch Arden* published. Newman's *Apologia pro Vita sua*. Taine's *Histoire de la Littérature Anglaise*.

1865. Death of Proudhon, January 19 (born, 1809). Treaty of peace between Spain and Peru, January 25. Occupation of Charleston by General Gillmore, February 17. The first telegram received in London direct from Kurrachee, March 1. President Lincoln enters upon second term of office, March 4. Death of Cobden, April 2 (born, 1804). Richmond entered by General Grant, April 3. Surrender of General Lee, April 9. Assassination of President Lincoln, April 14; vice-president Andrew Johnson succeeds him, April 15. Paraguay declares war on Argentine Confederation, April 16. Alliance between Brazil, Uruguay, and Argentine Confederation, May 1. Capture of President Davis, May 10, and end of American war. Italian seat of government transferred to Florence, May 11. Death of Isaac Taylor, June 28 (born, 1786). Death of Professor Aytoun, August 4 (born, 1813). Death of Sir William J. Hooker, August 12 (born, 1785). Convention of Gastein, respecting Danish duchies, August 14. Navigation treaty between Great Britain and Prussia, August 16. Rinderpest in England, July-October. Arrest of Fenian leaders in Ireland, September 15. Negro riots at Morant Bay, Jamaica, October 11. Death of Lord Palmerston, October 18 (born, 1764). Earl Russell first lord of the treasury, October 19. Leopold II. king of the Belgians, December 10. Commercial treaty between Great Britain and Austria, December 16. Slavery abolished in United States, December 18. Death of Frederika Bremer, December 31 (born, 1802). Lecky's *Rise and Influence of Rationalism* published. Pusey's *Eirenicon*.

1866. Suspension of Habeas Corpus Act in Ireland, February 17. Death of Dr Whewell, March 6 (born, 1794). Death of Keble, March 29 (born, 1792). Alliance between Prussia and Italy signed, March 27. Bombardment of Valparaiso by Spanish fleet, March 31. Civil Rights Bill passed by U.S. Congress, April 12. Prince Charles of Hohenzollern elected hospodar of Rumania, April 15. Suspension of Bank of England Charter Act, May 11. Fenian raids into Canada, May 31 and June 7. Suspension of Habeas Corpus Act in Canada, June 8. Prussia withdraws from Germanic Confederation, June 14. Prussians enter Saxony and Hanover, June 15. Austria declares war, June 17; Prussia, June 18; Italy, June 20. Italians defeated at Custozza, June 24. Resignation of the Russell ministry, June 26. Surrender of Hanoverian army, June 29. Prussians defeat Austrians at . . . July 3. Austria cedes Venetia to France, . . . ministry enter office, July 6. Occupation of Frankfort by Prussians, July 16. Battle of Lissa, July 20. Preliminaries of peace signed at Nikolsburg, July 26. Insurrection in Crete, August. Treaty of peace between Austria and Prussia signed at Prague, August 23. Treaty of peace between Austria and Italy signed at Vienna, October 3. North German Confederation formed, August-October. Venetia united to Italy, November 4. Rome evacuated by the French, December 3-11. *Ecce Homo* published. Swinburne's *Poems and Ballads*.

1867. Death of Victor Cousin, January 14 (born, 1792). Schleswig-Holstein incorporated with Prussia, January 24. Hungarian con-

stitution restored, February 7. First passage of a ship through the Suez Canal, February 17. Fenian agitation in Ireland, February-March. Nebraska admitted a State of the Union, March 1. Cession of Russian America to United States, March 13. Evacuation of Mexico by the French, March 16. International Exhibition at Paris opened, April 1 (closed, November 3). Dominion of Canada constituted, March 29. Coronation of the emperor and empress of Austria as king and queen of Hungary, at Pesth, June 8. The Livingstone search expedition sails from England, June 9. The emperor Maximilian of Mexico shot at Queretaro, June 19. North German constitution promulgated, June 25. Sultan visits Paris, June 30; London, July 12. New Reform Bill passed for England, August 15 (for Scotland and Ireland, July 13, 1868). Death of Faraday, August 25 (born, 1791). Prussian garrison withdrawn from Luxembourg, September 8. First detachment of British expedition against Abyssinia leaves Aden, September 28. Juarez re-elected president of Mexico, October. Garibaldi occupies Monte Rotondo, and threatens Rome, October 26. French troops enter Rome, October 30. Italian troops pass Roman frontier, October 30. Garibaldi defeated at Mentana, November 3; arrested, November 4. Annexation of Cochin China to France. Chaucer Society established in London. First vol. of Freeman's *Norman Conquest* published (completed, 1876).

1868. Death of Brewster, February 10 (born, 1781.) Occupation of Asuncion, Paraguay, by the allies, February 21. Resignation of Lord Derby, February 25. Impeachment of President Johnson, February 25. Magdala bombarded and taken by Sir R. Napier, King Theodore killed, April 13. Death of Marshal Jarvaez, April 23 (born, 1800). Death of Lord Brougham, May 7 (born, 1779). Samarcand occupied by Russians, May 14. Death of ex-president Buchanan, June 1 (born, 1791). Prince Michael III. of Servia assassinated at Belgrade, June 10; Milan Obrenovich proclaimed prince, July 2. Humaita evacuated by Paraguayans, June 25. Cabul recovered by Shere Ali, August 14. Insurrection in Spain, September 18. Death of Dean Milman, September 24 (born, 1791.) Battle of Alcolea, September 28. Queen Isabella leaves Spain, September 30. General Prim received at Madrid, October 7. Death of Rossini, November 13 (born, 1792). Resignation of Disraeli, December 2. The Gladstone ministry in office, December 9. Paraguayan army defeated and destroyed at Villeta, December 11. Lord Mayo, governor-general of India, December 20.

1869. Death of Lamartine, February 28 (born, 1792). General Grant president of United States, March 4. Hendon's Bay Territory ceded to the crown, April 9. Marshal Serrano regent of Spain, June 18. Irish Church Disestablishment Act passed, July 26. Valencia seized by Republicans, October 11; stormed by Government troops, October 16. Death of Sainte-Beuve, Oct 13 (born, 1804). Death of the earl of Derby, October 23 (born, 1799). Formal opening of the Suez Canal, November 17. Pacific Railway completed. Lecky's *European Morals* published.

1870. President Lopez, of Paraguay, defeated and killed at battle of Aquidaban, March 1. Death of Charles Dickens, June 9 (born, 1812). Abdication of Isabella II. of Spain, June 25. Spanish crown offered to Prince Leopold of Hohenzollern-Sigmaringen, July 4. Proposal denounced by French Government, July 6. Infallibility of the Pope voted by the Vatican Council, July 18. France declares war against Prussia, July 19. Abrogation of the concordat with Austria, July 30. The Irish Land Act passed, August 1. Attack on Saarbrück by the French, August 2. French defeated at Woerth and Spiechern, August 6. Elementary Education Act for England and Wales passed, August 9. Fall of the Ollivier ministry in France, August 9; Count Falikao first minister. Defeat of French at Gravelotte, August 18. Battle of Sedan, September 1. Surrender of Napoleon to the king of Prussia; capitulation of the French army, September 2. Revolution at Paris. Republic proclaimed, September 4. Flight of the empress. Italian troops enter Papal territory, September 17. Paris invested by Germans, September 19. Rome occupied by Italian troops, September 20. Capitulation of Strasburg, September 28. Versailles the headquarters of king of Prussia, October 5. Rome and the Papal States united to the kingdom of Italy, October 9. Orleans taken by General Von der Tann, October 11. Death of General R. E. Lee, October 13 (born, 1808). Fall of Metz, October 28. Communist insurrection at Paris, October 31. Russia throws off obligations of treaty of 1856 respecting neutrality of the Black Sea, October 31. Duke of Aosta elected king of Spain, November 16. Bavaria enters North German confederation, November 23. Death of Alexandre Dumas, December 5 (born, 1803). German empire declared, December 10. Towns surrendered, but not occupied by Germans, December 21. Marshal Prim shot at Madrid, December 28; died, 30. Mont Cenis tunnel completed.

1871. Le Mans occupied by Germans, January 12. King William of Prussia proclaimed emperor of Germany at Versailles, January 18. Battle of St Quentin, January 19. Bombardment of St. Denis begun, January 21. Capitulation of Paris, January 28. The army of Bourbaki interned in Switzerland, February 1. National

Assembly meets at Bordeaux, February 12. M. Thiers chief of the executive, February 17. Preliminaries of peace signed, February 26; ratified, March 1. Paris entered by Germans, March 1; evacuated, March 3. Communist revolution at Paris, March 18. National Assembly meets at Versailles, March 20. The commune proclaimed at Paris, March 28. Capture of Herat, by Yakob Khan, son of Shere Ali, May 6. Treaty of Washington, May 8 (ratified, May 24). Definitive treaty of peace between France and Germany, May 10 (ratified, May 21). Trial of the Tichborne case in Common Pleas begins, May 11; ends, March 6, 1872. Death of Sir John Herschel, May 11 (born, 1792). Death of Auber, May 13 (born, 1784). Paris entered by Versailles army, May 22. The Tuileries, Louvre, Palais Royal, &c., burnt by communists, May 24. Archbishop of Paris shot, May 24. End of insurrection, May 28. Seat of Italian Government transferred to Rome, July 1. M. Thiers appointed president of the republic, August 31. Purchase system in British army abolished by Royal Warrant, July 20. Death of Paul de Kock, August (born, 1794). Formal opening of Mont Cenis tunnel, September 17. Slave emancipation bill passed by senate of Brazil, September 27. Chicago burnt, October 8-10. Alabama Arbitration Commission meets at Geneva, December 18 (award signed, September 14, 1872). British Columbia incorporated with Dominion of Canada. Darwin's *Descent of Man* published. George Eliot's *Middlemarch*.

1872. Assassination of Lord Mayo in the Andaman Islands, February 8 (born, 1822). Lord Northbrook viceroy of India, February 22. Death of Giuseppe Mazzini, March 10, (born, 1805). Dutch possessions on the Gold Coast transferred to Great Britain, April 6. Carlist insurrection in Spain, April 22. Great eruption of Vesuvius, April 24-May 1. Expulsion of Jesuits by German Reichstag, June 19. Death of President Juarez, July 18 (born, 1809). The Ballot Act passed by English parliament, July 18. Extradition treaty between Great Britain and Belgium concluded, July 31. Japanese embassy arrives in England, August 17. Riots at Belfast, August 16-22. Death of Dr Merle d'Aubigné, October 19 (born, 1794). Public gaming tables, Baden-Baden, closed, October 31. Commercial treaty between France and England, November 5. Island of San Juan evacuated by British troops, according to award of German Emperor, November 22.

1873. Death of Napoleon III. at Chisellhurst, January 9. Death of Lord Lytton, January 18 (born, 1805). Abdication of King Amadeus of Spain, February 11. Republican government adopted by the Cortes. General Grant president of United States (second term), March 4. International exhibition at Vienna opened, May 1. Death of Dr Livingstone, in Central Africa, May 4, (born 1813). Death of John Stuart Mill, May 8 (born, 1806). Resignation of M. Thiers; Marshal Macmahon president of the French Republic, May 24. Autonomy of Egypt conceded by the sultan, June 8. Khiva taken by Russians, June 10. The Ashantes defeated by the English at Elmina, June 13. Visit of the shah of Persia to England, June 18-July 5. First reception of foreign ministers by emperor of China at Peking, June 29. Communist rising in Spain, July 10. Insurrection at Cartagena, July 14. Don Carlos re-enters Spain, July 16. New treaty of commerce between England and France signed, July 23. Payment of Alabama indemnity by England, September 9. Evacuation of French territory by Germans, September 16. Death of Sir Edwin Landseer, October 1 (born, 1802). Trial of Marshal Bazaine begins, October 6; he is sentenced, December 10. Encyclical letter of Pius IX. against "Old Catholics," November 21. Dutch expedition lands at Atchin, November 28. Death of Agassiz, December 15 (born, 1807). Supreme Court of Judicature Act passed.

1874. Coup d'Etat at Madrid by General Pavia, January 3. Marshal Serrano head of the new Government. Surrender of Cartagena, January 12. Capture of Coomassie by Sir G. Wolseley, February 4. Death of Strauss, February 8, (born 1808). Resignation of the Gladstone ministry, February 17. Mr Disraeli prime minister, February 18. The Tichborne claimant, after 188 days' trial, is found guilty of perjury, February 28. Death of Charles Sumner, March 11 (born, 1811). Visit of the czar to England, May 13-21. Death of Van de Weyer, May 23, (born 1802). Marshal Concha killed in engagement with Carlists near Estella, June 28. Spain declared in a state of siege, July 19. Escape of Marshal Bazaine from prison, August 9. Death of Guizot, September 12 (born, 1787). Cession of Fiji Islands to England, September 30. Death of Tschendorff, December 7 (born, 1815). Prince Alphonso proclaimed king of Spain, December 30. Transit of Venus, December 9. Toughened glass invented. *Supernatural Religion* published.

1875. Deposition of the Gaikwar of Baroda, April 23. The Arctic expedition ("Alert" and "Discovery") sails from Portsmouth, May 29. Great floods at Toulouse, June 24; and at Buda, June 26. Citadel of Seo d'Urgel, last Carlist fortress in Catalonia, surrendered, August 27. Occupation of Khokand by Russians, September 16. Prince of Wales sets out on visit to India, October 11. Purchase by England of Khedive's shares in Suez Canal announced, November 26. Tennyson's *Queen Mary* published. (W. L. R. C.)

CHRONOMETER, a watch of special construction to measure time with great accuracy, chiefly used in determining the longitude at sea. See **CLOCKS** and **WATCHES**.

CHRUDIM, a town in Bohemia, Austria, situated on the Chrudimka, a tributary of the Elbe, about 63 miles E.S.E. of Prague. It is the capital of a circle, and has a district court-house. There are five churches in the town, besides a monastery of the Capuchins, a high school, an infirmary, and an alms-house. Calico-printing is carried on to some extent. Population, 9400.

CHRYSIPPUS (c. 280–206 B.C.), one of the greatest of the Stoics, was born probably in 280 B.C., at Soli, in Cilicia. Being robbed of his property, he visited Athens, and attended the lectures, possibly of Zeno, and certainly of Cleanthes. The latter he succeeded as recognized chief of the school. He is also said to have been instructed in the doctrines of the Middle Academy by Arcesilanus and Laetides. Chrysippus was the author of a prodigious number of works, which, though extremely prolix and disfigured by great obscurity and carelessness of style and language, were distinguished by extensive learning and considerable acuteness. But nothing has come down to us except small fragments, and from these it is difficult to discover what doctrines are originally due to Chrysippus. We know, however, that he made considerable emendations on the theory of Zeno and Cleanthes. With regard to the relation of moral to physical science, he reversed their conclusion, adopting the view, which from that time became characteristic of Stoicism, that, as the sole aim of philosophy is to discover man's duty, ethics is the only science that is of real importance in itself, while physics is to be regarded merely as an aid to its study. He improved on the crude theory of perception which had been held by his predecessors, who compared the action of the object on the mind to that of the seal on the wax, arguing that this would do away with the possibility of the simultaneous perception of more than one object, and denying that the mental modification resembles the object. He also finally determined the Stoical theory of the criterion of truth, which, according to him, is irresistible conviction. Much attention was paid by Chrysippus to formal logic. He held that the hypothetical syllogism is the original type of syllogistic inference, and he devoted the most elaborate study to its various forms. He drew up a scheme of the categories,—making the highest Substance (*τὸ ὑποκείμενον*); the next, Form, or essential attribute; the third, Variety, or that non-essential attribute which is at the same time independent of all but the object itself; the fourth, Variety of Relation, or that non-essential attribute which depends on the relation of the object to some other object. Chrysippus also gave some attention to linguistic, and especially to grammatical investigations.

The explanation of the universe adopted by Chrysippus is that of the rest of his school. The real is the corporeal; man and the world are all that exists. In each there is that which is inert, and also the informing soul or vivifying fire. The soul of the universe is God, or Destiny. Each human soul is part of the universal soul, in which, according to the view originated by Chrysippus, the souls of all, except the wise, are again swallowed up at death. The universe is perfect. So-called physical evil is none. Moral evil is the necessary complement of good, and is turned by Providence into good. All is the result of perfect law. Yet Chrysippus employed all his subtilty to establish the freedom of the will. Another inconsistency was his reliance on divination, which he strove to explain on a theory of natural causation. The stories of the gods Chrysippus regarded as symbolical myths; and of many of them he attempted ingenious explanations.

In morals Chrysippus somewhat modified the extreme theory of the earlier Stoics. He admitted between the good

and the bad a third class of things—the indifferent, and even avowed that it is foolish not to desire health, and riches, and honour. In practice a man of unsullied purity, he felt bound to conclude, from the theory that the lower animals live according to nature, that incest and many other crimes, and acts so repulsive as the devouring of the bodies of the dead, are natural, and therefore not to be blamed.

See Diogenes Laertius; Plutarch, *De Stoicorum Repugnantiis*; Petersen, *Philosophia Chrysippi Fundamenta* (Altona, 1827); Baguet, *Commentatio de Chrysippi vita, doctrina, et reliquiis* (Louvain, 1822); Hagedorn, *Moralia Chrysippea* (1685); Richter, *De Chrysippo Stoico fastuoso* (Leipsic, 1738); Zeller, *Stoics, Epicureans, and Sceptics*.

CHRYSOLORAS, MANUEL (c. 1355–1415), a learned Greek who was instrumental in spreading Greek literature in the West, was born at Constantinople, about 1355, of a distinguished family, which had removed with Constantine to Byzantium. While still very young, he was sent by the emperor John Palæologus to implore the aid of the Christian princes against the Turks. After several years he returned to Constantinople; but at the invitation of the magistrates of Florence, about the year 1395, he became professor of the Greek language in that city, where he taught three years. Having visited Milan and Pavia, and resided for several years at Venice, he went to Rome upon the invitation of Aretino, who had been his disciple, and was then secretary to Gregory XII. In 1408 he was sent to Paris on an important mission from Manuel Palæologus, the Greek emperor. In 1413 he was appointed by Pope Martin V. on an embassy to the Emperor Sigismund, of which the object was to fix a place for the assembling of a general council. It was decided that the meeting should take place at Constance; and Chrysoloras was on his way thither, having been chosen to represent the Greek church, when he died suddenly on the 15th of April 1415. Only two of his works have been printed, viz., his *Erotemata*, which was for some time the only grammar in use in the West, and *Epistolæ III. de comparatione veteris et novæ Romæ*; but many others exist in MS.

CHRYSOSTOM, St JOHN (*Χρυσόστομος*, golden-mouthed), the most famous of the Greek fathers, was born of a noble family at Antioch, the capital of Syria, most probably about 347. At the school of Libanius the sophist he gave early indications of his mental powers, and would have been the successor of his heathen master, had he not been, to use the expression of his teacher, stolen away to a life of piety (like Augustine, Gregory of Nazianzus, and Theodoret), by the influence of his pious mother Anthusa. Immediately after his baptism by Meletius, the bishop of Antioch, he gave up all his forensic prospects, and buried himself in an adjacent desert, where for six years he spent a life of ascetic self-denial and study. His infirmities, however, compelled him to return to the world; and the authority of Meletius gained his services to the church. On his arrival he was ordained deacon in his thirty-fifth year (381), and afterwards presbyter at Antioch. On the death of Nectarius he was appointed archbishop of Constantinople by Eutropius, the favourite minister of the Emperor Arcadius. He had, ten years before this, only escaped promotion to the episcopate by a very questionable stratagem,—which, however, he defends in his instructive and eloquent treatise *De Sacerdotio*. As a presbyter, he won high reputation by his preaching at Antioch, more especially by his homilies on *The Statues*, a course of sermons delivered when the citizens were justly alarmed at the prospect of severe measures being taken against them by the Emperor Theodosius, whose statues had been demolished in a riot.

On the archiepiscopal throne Chrysostom still persevered in the practice of monastic simplicity. The ample re-

venues which his predecessors had consumed in pomp and luxury he diligently applied to the establishment of hospitals; and the multitudes who were supported by his charity preferred the eloquent discourses of their benefactor to the amusements of the theatre or of the circus. His homilies, which are still preserved, furnish ample apology for the partiality of the people, exhibiting the free command of an elegant and copious language, an inexhaustible fund of metaphors and similitudes, giving variety and grace to the most familiar topics, with an almost dramatic exposure of the folly and turpitude of vice. His zeal as a bishop and eloquence as a preacher, however, gained him enemies both in the church and at the court. The ecclesiastics who were parted at his command from the lay-sisters (whom they kept ostensibly as servants), the thirteen bishops whom he deposed for simony and licentiousness at a single visitation, the idle monks who thronged the avenues to the court and found themselves the public object of his scorn—all conspired against the powerful author of their wrongs. Their resentment was inflamed by a powerful party, embracing the magistrates, the ministers, the favourite eunuchs, the ladies of the court, and Eudoxia the empress herself, against whom the preacher thundered daily from the pulpit of St Sophia. A favourable pretext for gratifying their revenge was discovered in the shelter which Chrysostom had given to four Nitrian monks, known as the tall brothers, who, on being excommunicated by their bishop, had fled to Constantinople; and a ready tool was found in Theophilus, bishop of the rival city of Alexandria, who had driven them from their diocese, and had long circulated in the East the charge of Origenism against Chrysostom. By his instrumentality a synod was called to try or rather to condemn the archbishop; but fearing the violence of the mob in the metropolis, who idolized him for the fearlessness with which he exposed the vices of their superiors, it held its sessions in the suburb of Chalcedon, named the Oak, where Rufinus had erected a stately church and monastery. A bishop and a deacon were sent to accuse the archbishop, and presented to him a list of charges, in which pride, inhospitality, and Origenism were brought forward to procure the votes of those who hated him for his austerity, or were prejudiced against him as a suspected heretic. Four successive summonses were signified to Chrysostom, but he indignantly refused to appear until four of his notorious enemies were removed from the council. Without entering into any examination of the charges brought before them, the synod condemned him on the ground of contumacy; and, hinting that his audacity merited the punishment of treason, called on the emperor to ratify and enforce their decision. He was immediately arrested and hurried to Nicæa in Bithynia. As soon as the news of his banishment spread through the city, the astonishment of the people was quickly exchanged for a spirit of irresistible fury. In crowds they besieged the palace, and had already begun to take vengeance on the foreign monks and sailors who had come from Chalcedon to the metropolis, when, at the entreaty of Eudoxia, the emperor consented to his recall. His return was graced with all the pomp of a triumphal entry, but in two months after he was again in exile. His fiery zeal could not blind him to the vices of the court; and heedless of personal danger he thundered against the profane honours that were addressed almost within the precincts of St Sophia to the statue of the empress. The haughty spirit of Eudoxia was inflamed by the report of a discourse commencing with the words,—“Herodias is again furious; Herodias again dances; she once more demands the head of John;” and though the report was false, it sealed the doom of the archbishop. A new council was summoned, more numerous and more subservient to the wishes of Theophilus; and troops of

barbarians were quartered in the city to overawe the people. Without examining it, the council confirmed the former sentence, and condemned him afresh for having resumed his functions without their permission. He was hurried away to the desolate town of Cucusus, among the ridges of Mount Taurus, with a secret hope, perhaps, that he might be a victim to the Isaurians on the march, or to the more implacable fury of the monks. He arrived at his destination in safety; and the sympathies of the people, which had roused them to fire the cathedral and senate-house on the day of his exile, followed him to his obscure retreat. His influence, however, became more powerfully felt in the metropolis than before. In his solitude he had ample leisure for forming schemes of missionary enterprise; and by his correspondence with the different churches, he at once baffled his enemies, and gave greater energy to his friends. This roused the emperor to visit him with a severer punishment. An order was despatched for his instant removal to the extreme desert of Pityus; and his guards so faithfully obeyed their cruel instructions that, before he reached the sea coast of the Euxine, he expired at Comana in Pontus, in the sixtieth year of his age. His exile gave rise to a schism in the church, and the Johannists (as they were called) did not return to communion with the archbishop of Constantinople till the relics of the saint were, 30 years after, brought back to the Eastern metropolis with great pomp, and the emperor publicly implored forgiveness from Heaven for the guilt of his ancestors. The festival of St Chrysostom is kept in the Greek Church, November 13, and in the Latin Church, January 27.

In his general teaching Chrysostom elevates the ascetic element in religion, and in his homilies he inculcates the need of personal acquaintance with the Scriptures, and denounces ignorance of them as the source of all heresy. If on one or two points, as for instance the invocation of saints, some germs of subsequent Roman teaching may be discovered, there is a want of anything like the doctrine of indulgences or of compulsory private confession. Moreover, in writing to Innocent, bishop of Rome, he addresses him as a brother metropolitan, and sends the same letter to Venerius, bishop of Milan, and Chromatius, bishop of Aquileia. His correspondence breathes a most Christian spirit, more especially in its tone of charity towards his persecutors; and his line of exegesis, if not acutely metaphysical or mystical, is full of good sense and right feeling.

His works are exceedingly voluminous, and consist chiefly of homilies, commentaries, smaller treatises, epistles, and liturgies. Their excellence is powerfully shown in the history of the times, for the illustration of which they afford highly valuable materials. The school of exegesis formed by him, and especially illustrated by such works as his commentaries on the Gospel of St Matthew, the Book of Acts, the Epistle to the Romans, and other parts of the New Testament, is sound, practical, and may (as Dr Newman has justly remarked) almost be called “English.” It was subsequently adorned by the justly honoured names of Theodoret, Theophylact, Euthymius, and Nicephorus. The best edition is that of Bernard de Montfaucon in 13 vols. fol., 1718–1738, reproduced with some improvements by the Abbé Migne (Paris, 1863); but this edition is greatly indebted to the one issued more than a century earlier (1612) by one of the foremost English scholars of his age, Sir Henry Savile, provost of Eton College, from a press established at Eton by himself. It is in eight volumes, and is said to have cost its editor £8000. Hallam (*Lit. of Europe*, iii. 10, 11) calls it “the first work of learning, on a great scale, published in England.” Numerous MSS. still remain unedited. Some of the homilies and commentaries are translated in the *Library*

of the *Fathers*, published at Oxford, and the Greek text has been in part re-edited by a scholar who has shown a very special aptitude for the work, the Rev. F. Field of King's College, Cambridge. As authorities for the facts of his life, the most valuable are the ecclesiastical histories of Socrates, Sozomen, and Theodoret; and amongst the moderns, Erasmus, Cave, Lardner, and Tillemont, with the more recent church history of Neander, and his monogram on the *Life and Times of Chrysostom*, translated by J. C. Stapleton. There has also appeared a valuable German biography by Dr Förster; and a narrative, full of interest and told with life-like animation, has been given by the late M. Amedée Thierry in the *Revue des Deux Mondes*, and since republished (Paris, 1860) in one volume, entitled *Recits de l'Histoire Romaine au cinquième Siècle*. A graceful and interesting sketch of the concluding scenes of St Chrysostom's life may be found in Dr Newman's *Historical Sketches* (London, 1873), though that eminent writer seems not very favourable to the theology of the Antiochene school, or even of Chrysostom himself. Valuable information is given in Professor Bright's *History of the Church* (Oxford, 1864), and in Canon Robertson's *History of the Christian Church* (vol. ii., London, 1874). But the best special contribution to English literature on the subject is *St Chrysostom: His Life and Times*, by the Rev. W. R. W. Stephens (London, 1872).

CHUB. See ANGLING. Vol. ii. p. 42.

CHUBB, THOMAS (1679–1746), a well-known deistical writer, was the son of a maltster, Henry Chubb, and was born in the village of East-Harnham, near Salisbury, on the 29th September 1679. His father died in 1688, and left in poor circumstances a widow and four children, of whom Thomas was the youngest. All of them were early sent to work; and consequently the education which Thomas received in his boyhood was of a most elementary kind. In 1694 he was apprenticed to a glove-maker in Salisbury; but as the work was afterwards found to be unsuitable for him on account of the weakness of his sight, he entered the employment of a tallow chandler, and his income for many years was derived partly from this source and partly from glove-making. Through energy and perseverance he succeeded in gaining a fair knowledge of mathematics, geography, and some other subjects. Theology, however, was what chiefly commanded the attention of Chubb and his companions, among whom he seems to have been the moving spirit. His intellectual activity, and the eagerness he always displayed to gain clear and distinct views of any question that occupied him, marked him out from the first; and his early habit of committing his thoughts to writing gave him a clear and fluent style which afterwards found much favour with the public. He made his first appearance as an author in the Arian controversy, on the side of Whiston. A dispute having arisen among his friends about Whiston's argument in favour of the supremacy of the one God and Father, Chubb was led to write an essay which bore the title, *The Supremacy of the Father Asserted*. This, passed round his friends in manuscript, created so favourable an impression that the author ultimately submitted it to the judgment of Whiston, who pronounced it well worthy of publication. After a few emendations by Whiston, it was printed in 1715. A number of tracts on various subjects followed, which were published in a collected form in 1730. Chubb was now regarded as a literary phenomenon. Among other persons of eminence, he attracted the attention of Sir Joseph Jekyll, Master of the Rolls, in whose house he lived for several years. The nature of his position there is not precisely known; but there are stories told of his having waited at table as a servant out of livery, and of the amusement caused by his short stout figure standing as

steward at his patron's sideboard. His love of independence and retirement drew him back to Salisbury, where by the kindness of friends he was enabled to devote the rest of his days to his favourite studies. He died on the 8th February 1746. His moral character was excellent, and he is said to have continued a regular attendant on divine worship in the parish church.

Chubb was the author of a very large number of controversial tracts. His principal works are—*A Discourse Concerning Reason* (1731), *The True Gospel of Jesus Christ* (1739), and *Posthumous Works*, 2 vols. (1748). The *Discourse Concerning Reason* aims at showing that reason is, or ought to be, a sufficient guide in matters of religion. After defining the terms of this proposition, he proceeds to argue that if man is accountable to God for his actions, he has a right to possess a power sufficient to discover what he is accountable for, and also to discover such motives to right behaviour as will counterbalance those temptations which are unavoidable in the present constitution of things. It will not help the case to say that man, as originally constituted, had such a power, but lost it through Adam's fall; since it matters not to mankind whether Adam had originally such a power or not. Men cannot justly be held accountable if they lost in Adam that power. If the power was only impaired through Adam's sin, and if every man will be judged according to the ability he has, then reason is a sufficient guide in matters of religion. Difficulties which unavoidably arise from the constitution of things are only chargeable upon the author of that constitution. If divine revelation was meant to supply the defect of reason, then millions, whom that revelation has never reached, have been unjustly dealt with. The deficiency being general, the revelation should have been given to the whole species. The sufficiency of reason does not make revelation needless, as reason may be neglected or abused, and revelation may be needed to bring men back to a right use of reason in religion. True, reason could not discover how divine justice is satisfied by the sufferings and death of Christ, and how the sinner is justified by faith in Him; but that is repugnant to reason, and can be no part of the genuine revelation. One unjust action cannot satisfy justice for another. Nor can sin, considered abstractedly from the sinner, be the object of favour or displeasure. Only what faith leads to, viz., repentance and turning to God, is the true ground of God's mercy and kindness to men. This is most evident to reason when discovered, and must therefore be discoverable by reason. If, as is allowed, reason is a proper guide in matters of revelation, it should not be less so in matters of religion, for the one seems to be as much within the province of reason as the other. At the close Chubb disavows any intention to injure divine revelation, or to serve the cause of infidelity. The *True Gospel of Christ* is characterized by Lechler, in his *Geschichte des englischen Deismus*, as an essential moment in the historical development of deism. Its leading thought is that Christianity is not doctrine, but life. Jesus requires us to regulate our life according to the eternal and unchangeable law of action which is based on the reason of things. If men, through violation of this law, incur God's wrath, repentance and reformation are the only means of obtaining God's favour and forgiveness. That these truths may make a greater impression, the gospel declares that God has appointed a day of judgment and retribution. The law of nature is thus the essential content of the gospel. It is no historical account of facts, as Christ's death, resurrection, &c., for it was preached to the poor before these events occurred. Nor do the private opinions of the evangelists and apostles form any part of the gospel. Like Tindal, Chubb comes to the conclusion that the true gospel of Christ is identical with natural religion. The greater portion of the *Posthumous Works* is taken up with *The Author's Farewell to his Readers*, in which he comes to a sceptical conclusion regarding a particular providence, the efficacy of prayer, and a future state of existence, although he thinks that man's responsibility affords some probability of the latter. He rejects the Jewish revelation, because it sullies God's moral character. Mahometanism, he thinks, could not have prevailed by the sword alone; "it must have prevailed to a very great degree before the sword could have been drawn in its favour." He believed there was a man Jesus, who collected a body of disciples, and laid a foundation for a new sect among the Jews. His objections against the prophecies and miracles are often far-fetched, and contain nothing beyond what had been urged by previous writers. It lends a special interest to Chubb's representation of primitive Christianity that he insists on the fact that it was a gospel for the poor. There is thus a democratic tendency in the view he takes of the gospel. He represents the rise of deistical notions among the artisan class.

CHUNAR, or CHUNARGHUR, a town and ancient fortress of India, in the district of Mirzapur, in the North-West Provinces, situated on the south bank of the Ganges. The fort-

occupies a conspicuous site on the summit of an abrupt rock which commands the river. It was at one time a place of great strength, and still contains a magazine, and is fortified with batteries. In the old citadel on the height, the remains of a Hindu palace with some interesting carvings indicate the former importance of the place. The town, which consists of one or two straggling streets, contains a handsome English church. Chunar is first mentioned in the 16th century, when in possession of Sing Joapore. In 1530 it became the residence of Shere Khan the Afghan, and forty-five years later was recovered by the Emperor Akbar after sustaining a siege of six months. It fell into the hands of the English under General Carnac in 1763 after a prolonged resistance which caused considerable loss to the assailants. A treaty with the nabob of Oudh was signed here by Hastings on behalf of the East India Company, in September 1781. Population, 11,000.

CHUND, or CHAND, or CHANDRA-BARDAI, a Hindu writer belonging to the 12th century, was court-poet to the last of the Hindu sovereigns of Delhi. His poem is an encyclopædic work of immense size. It includes a history, and especially an account of the exploits of the author and of his master. It is still popular among the Rajputs. An account of Chund, with some translations of his poem, is given by Colonel Tod, in vol. i. of the *Transactions of the Royal Asiatic Society*.

CHUPRAH, a town of India, in the province of Behar, Bengal, situated on the north bank of the Ganges, 35 miles north-west of Patna. The town contains several mosques and pagodas, and some churches. It extends nearly a mile along the Ganges, and is not much above the level of the river. A considerable trade is carried on by the inhabitants in saltpetre, sugar, and cotton. The military station is separate from the town. Population about 30,000.

CHUQUISACA, the capital of Bolivia, also known as La Plata, Charcas, and Sucre. See SUCRE.

CHUR, the capital of the Swiss canton of Grisons, otherwise known by the French form of the name, Coire. See COIRE.

CHURCH. All who call themselves Christians agree in admitting that in the New Testament (and also, though in a more shadowy and less distinct manner, in the Old Testament) there is to be found frequent mention of a corporate body known as the church,—sometimes spoken of more fully as the Church of God, or the Church of Christ. It is referred to by its divine Founder as about to be built upon a rock (Matthew xvi. 18). In the book of Acts it has become a living reality, including apostles, elders, and laity,—holding a council, and making decisions upon most points of doctrine and of practice (Acts xvi. 4–22). In the epistles it is spoken of in terms of great magnificence, akin to the glowing language of prophecy. Christ, in His glorified humanity, is recognized as its head; it is in turn His body, His fulness, and His spouse.

The exact ideas involved in the word church, the questions concerning its powers, its nature and essence and modes of governance and continuance, its relation to Holy Scripture, and its relation to the state—have all been fruitful matters of controversy. These questions have emerged in a marked manner during the controversy with the Gnostics, the controversy with the Novatians and the Donatists, and those arising out of the Reformation. Hence among the writings of the fathers, bearing upon the nature of the church, may be specially named those of St Irenæus in opposition to the Gnostics, of St Cyprian against the Novatians, and of St Augustine against the Donatists. The relations of the church to the state became subjects of discussion directly Constantine had made

Christianity the religion of the empire. These relations are illustrated by the history of Arianism, Donatism, and Priscillianism, by the career of St Chrysostom, and by the fierce conflicts of the Middle Ages between Guelfs and Ghibellines—the former siding with the Pope, the latter with the emperors. The contest between Philip the Fair and Pope Boniface, and that of Philip Augustus of France and John of England against Pope Innocent III. turned upon the same great controversy, again and again renewed during the Middle Ages. Some of the most striking mediæval illustrations of the conflict are to be found in the life of Occam, and in the *Divina Commedia* of Dante. The points in dispute have been keenly discussed by modern historians;—those of the 18th century, as Hume, Henry, Mably, being strongly on the side of the state; those of the 19th, as Guizot, Voigt, Michelet, Palgrave, Arnold, Bridges, Mill, and even Macaulay, and, to some extent, Milman, more or less emphatically advocating the cause of the mediæval church during at least a portion of the struggle.

The Reformation in great measure turned upon both sets of questions,—the relation of the church to the Scriptures and its relation to the state. Consequently, they occupy no small portion both of the controversial literature and of the political history of the 16th and 17th centuries. On the religious side they are illustrated by the lives and writings of Martin Luther, Calvin, Melancthon, and the Continental Reformers generally, as well by those of Knox and of Cranmer in Britain, and of their Roman Catholic opponents, such as Ignatius Loyola, and in a later age by Cardinal Bellarmine and by Hooker, by Andrewes and others; and on the political side by such events as the Thirty Years' War, the Spanish Armada, the Revolution of 1688. The last two centuries have not witnessed any distinctively religious war. But these questions underlie the numerous "concordats" drawn up between the Church of Rome and various states in Europe and America, the entire history of Gallicanism and Jansenism, the Tractarian controversy commencing in England in 1833 A.D., and the contemporary discussion in Scotland, which ended in the Disruption of 1843 and the formation of the powerful and energetic body of Presbyterians, known as the Free Church. The disestablishment of the Anglican Church in Ireland raised cognate questions, and it is evident that disestablishment, already a fact in the United States, in France, in Ireland, and in some of the British colonies, may at any moment become a question of no slight political importance. Among more modern writers who have treated these questions may be named Bishop Warburton, De Maistre, the Rev. Sir W. Palmer, Rothe, Klee, the Abbé Mignet, Mr Gladstone, Dr Arnold, and many more, especially the commentators on creeds and confessions, as Möhler, Bishop Burnet, Bishop Harold Browne.

It remains to mention a few of the more prominent views and definitions prevalent among leading bodies of Christians.

1. As regards the church triumphant there would probably be little or no controversy. The great bulk of Christians would acknowledge it as "the whole body of the glorified, consisting of the holy angels and of the spirits of the just made perfect who have been redeemed by the merits (whether foreseen or actually wrought) of the divine Head of the church, Jesus Christ, the Incarnate Son of God."

2. But concerning the church on earth, definitions vary considerably. In the first place there emerges the important question, whether it is a visible or an invisible body. This is not the place to discuss which is the view set forth in Holy Scripture,—that being of course the very point at issue. It must here suffice to say that the disciples of

Calvin (followed herein by a very large number, probably the majority, of purely Protestant communities) maintain that it is invisible; while the Lutherans, the Roman Catholics, the Oriental Christians, and the great bulk of the more famous Anglican divines (in accordance with the Anglican formularies) maintain it to be visible. This latter view is, it need hardly be said, the one all but universally adopted by the fathers and the schoolmen. In one passage, however, of his later writings, St Augustine employs an expression at variance with his usual tone, and favourable to the Calvinistic view, by calling the church "the society of the predestined."

3. The relations considered to exist between the visible church and Holy Scripture must necessarily be those of co-ordination, or of sub-ordination on one side or the other. An impartial estimate of the Anglican formularies would probably be found to support that view of co-ordinate authority, of Scripture and the church which is taken by a large body of her divines, such as Bishops Pearson, Bull, Kay, Dean Jackson, and others; though many of her adherents would undoubtedly incline, more or less completely, to that more Protestant view, which subordinates the church to Scripture, a view held most strongly by those bodies whose confessions of faith (as, e.g., the Westminster Confession) seem to imply that the books of Scripture attest themselves as divine. In the Church of Rome there can be no question but that the church is placed above Holy Scripture; for though Scripture proofs of doctrine are always, if possible, sought by her controversialists, and referred to in her symbolical standards (as, for instance, the Tridentine decrees), yet the traditions preserved in the church are spoken of as to be venerated not merely as comments on the meaning of Scripture, but as deserving equal honour and reverence with Scripture (*Decret. Conc. Trident.*, sessio iv.) On the other hand, the Anglican formularies teach that Holy Scripture contains all things necessary to salvation (Art. vi.), though the church is described as the witness and keeper of Holy Writ and as having authority in controversies of faith (Art. xx.). The school of Anglicanism represented by Field, Hammond, Pearson, Bull, and Bramhall regards a judgment of the church universal, such as that of the Council of Nice against Arius, as "irrevocable, irreformable, never to be altered." (See Sir W. Palmer's *Church of Christ*, part iv. ch. iv.) The Eastern Church seems to place the relation of Holy Scripture to itself in almost the same position as this school of Anglicans, though it would perhaps lay somewhat stronger stress on the insufficiency of Scripture without the voice of the teaching and interpreting church. It may be remarked that in this, as in other matters, belief has from time to time been greatly influenced by the course of events. In the first age of Christianity, before the canon of the New Testament was formed, the church is almost everything (as Reuss and others have observed), and the Bible, which chiefly consisted of the Old Testament, was subordinate. By about 200 A.D., when the gospels were becoming better known, the relation between Scripture and the church appears in patristic writings much more like one of co-ordination. During the Middle Ages, as the church's political power increased, Holy Scripture became more and more subordinate, until we find Dante complaining of the way in which not merely creeds and fathers but canon law and the decretals are studied instead of the Gospel (*Paradiso*, ix. 133). The Reformation necessarily caused a reaction, built, as it was so largely, on new translations and on the circulation of the Bible; and in the following century we find the successors of the Reformers laying more stress upon what is commonly called the verbal inspiration of the Scripture and its infallible authority than had been done for the most part by the

fathers (except perhaps St. Augustine) or by the first Reformers, Luther and Calvin, and their contemporaries, who never seem to have sanctioned the famous *dictum* of Chillingworth, "The Bible, and the Bible only, is the religion of Protestants." Of late years the difficulties arising from science, philology, history, and criticism have tended to modify this view of the supremacy of Scripture. Not only in the unreformed communions and among Anglicans and Lutherans, but even in Calvinistic bodies, is this effect perceived. Thus we find an eminent Presbyterian divine, a minister of the Scottish Establishment, writing as early as 1848, "The living church is more than the dead Bible, for it is the Bible and something more" (*Life of Dr Norman Macleod*). The comment made by Kant on the inconsistency of those Lutherans who virtually say "Go to the Bible, but do not find anything there except what we find" is well known (*Streit der Facultaten*).

4. Turning to the constitution and government of the church, it is singular that in none of the symbolical utterances of the leading Christian communities is there found such a definition of the church as would really include all that is believed by those respective bodies. Nor is it easy to supply the want by appeal to divines, though many have striven to set forth the "notes" of the true church (see, e.g., Klee, *Dogmatik*, and many others). Neither the Roman Catholic Tridentine decrees nor the Westminster Confession supply any definition, and the one given in the nineteenth of the Articles of the English Church leaves the questions at issue between Rome and the Reformers, between Episcopacy and Presbyterianism, entirely open. For all would claim to represent that "visible church of Christ" which is there described as "a congregation of faithful men, in the which the pure word of God is preached, and the sacraments be duly ministered according to Christ's ordinance in all those things that of necessity are requisite to the same."

Concerning the question of government there are four leading views. The first is, that no form of government was instituted by the divine Founder of the church or His apostles, that there was originally no distinction between clergy and laity, but that officers were in due time appointed as might happen in any human society, for the sake of order and convenience. This view, which is probably that of the majority of Protestants at the present time, has found a thoughtful, devout, and highly gifted exponent in the historian Neander; while the difficulties of reconciling it with the New Testament are all set forth by two independent translators of his work, the Rev. J. H. Rose and Mr Morrison. A second view is, that a government was in such wise instituted as rightly to claim a *jus divinum*, that this government resides in presbyters, and is handed down by succession through the presbyterate. This view was maintained by many foreign adherents of the Reformation, and in England by Richard Cartwright, the Puritan opponent of Hooker, and an entire school of his day. They appeal to history, especially that of the Alexandrian Church, and to the fathers, more especially to St Jerome. The third view resembles this in principle, but assigns the governance to a superior order, that of the bishops, and makes the succession pass through them. The Anglican communion acts upon this view, re-ordaining all ministers not episcopally ordained, but accepting Greek or Roman Catholic ordination; and it has been defended by many of the writers of the High Church school, above named, to whom may be added Bishop Bilson, and the able Scottish controversialist Bishop Sage in his work against Gilbert Rule. (See also Bishop Cotterill's *Genesis of the Church*, and article BISHOP). This school lays great stress on the decisions of the œcumenical councils, of which it recognizes six or (according to Bishop Andrewes) seven before the division of East and West.

This view, though strongly supported by the Eastern churches as well as by an historical and living school of Anglicans, is undoubtedly open to the difficulty, acknowledged by Mr Gladstone and others, of making the church as a collective body remain silent for some thirteen centuries and still unable to speak. There remains the fourth, the Roman Catholic view, which subjects the entire episcopate to the bishop of Rome, and makes full communion with him of the essence of churchmanship. This view has been supported ever since the Middle Ages with immense zeal and learning by many able Catholic writers. Although a strong case against it has been made out from the fathers, especially the Eastern ones, and although the state of matters just before the Reformation was everywhere one of gross abuses and much superstition, yet the good points of the Papacy have been fully recognized by Protestants and Anglican writers, such as Guizot, Michelet, Comte, Ranke, Sir James Stephen, Dr Arnold, Archbishop Trench, and Bishop Harold Browne. Nevertheless, the increasing development of the Papal claims has been strongly resisted within the pale of that church by the Jansenists, by the Gallican divines such as Bossuet, and by the entire body of the Port Royalists, including such brilliant names as those of St Cyran, De Saey, Arnauld, and above all Pascal. All these display a Calvinistic element in their teaching, and more or less (as for instance Fleury in his famous Church History) modify the distinctively Roman characteristics most opposed by Protestants, and they place a general council far above the Pope. In our own day the counter-theory among Roman Catholics, of which De Maistre was a leading spokesman, has been seemingly ratified by the Vatican Council and the Pope declared infallible. This extreme step has provoked a schism among Roman Catholics, and alienated some of their most eminent men.

Of the different views entertained concerning the relation between church and state, it must be enough to say here that occasional collision seems almost unavoidable. For where two independent societies lay claim to a common ground, those claims, unless precisely defined, will sometimes militate. No state has yet been known to carry out the theory of Locke, and confine its attention purely to the preservation of life and property. But every state which considers public morality to be within its sphere, and legislates on such matters as marriage and education, must of necessity occupy to some extent the same ground as the various Christian communities which claim to be the local church. (J. G. C.)

CHURCH HISTORY. In this article we shall consider (1) The Definition, (2) The Sources, (3) The Method, and (4) The Literature of the subject.

Considered as a department of universal knowledge, church history forms a special section of the religious history of mankind. It is an account of the growth and the transactions of the religious community which is marked out from others by its attachment to Christianity. This definition already excludes from consideration a region of inquiry important in itself, which is sometimes regarded as forming an integral part of the subject. Starting from that idea of the church which is represented etymologically by the undoubtedly false derivations of the word from the German *küren*, to choose, or the Greek *κύριον οἶκος*, the (figurative) house of the Lord, various writers have assumed the church to be that special section of mankind who in any age have enjoyed the true revelation of God as given by himself, and they have in consequence regarded church history as bound to deal first with the Old Testament church and then with the church of the New Dispensation. This, however, involves an amount of dogmatic prepossession to which history, simply as such, cannot commit itself. Surveying the field of mere ob-

jective fact, history can single out, under the general appellation of the church, a great society whose origin can be distinctly traced up to the personal activity of Christ, who, for this society, forms a definite and wholly new historical commencement. Whatever etymology we assign to the word *church* under its various modifications of *kirche*, *kirk*, *kerk*, *cyrkaw*, *zerkow*, &c.,—whether we follow the derivation suggested by Walafrid Strabo in the 9th century, and extensively held since, from τὸ κυριακόν, the Lord's house, as a term introduced by the Greek missionaries into the language of the heathen tribes whom they converted, or whether we adopt the not less probable conjecture of Lipsius, and ascribe its origin to "eire" or "eere" (connected with the Latin *circus*), the local name for the temple of Northern paganism, adopted by ancient and mediæval Christianity, in conformity with its principle of accommodating itself as far as possible to the usages of its proselytes—there can be no doubt that the community and the movement, which, under some form of the name *church* among the Germanic races, and of the name *ecclesia*, such as *église*, *chiesa*, &c., among the Latin nations, succeeded in subjugating the Roman empire, along with extensive regions beyond it on all sides, to a religion whose personal centre is Christ, form a fresh phenomenon in the history of mankind, as distinct and individual in its character as Hellenism, Hinduism, or Mohammedanism. In the view of history proper, therefore, the history of Judaism cannot be taken as forming a part of the history of the church.

For the same reason history cannot take action upon a class of distinctions recognized by many who assume the functions of the church historian. Such writers, adopting some strict and special definition of the church, confine the work of church history to that section of professing Christians whose condition satisfies the terms of their definition, any other so-called division of Christendom coming in for a share of attention only in the narrative of the opposition encountered by the church. History, in the proper sense, cannot undertake to decide questions of this description. To say which among many competing churches is the true church involves a dogmatic deliverance, which is beyond its province. It must do its work in a more rough and general fashion. Under the name church it comprehends all organizations avowedly basing themselves upon Christianity and recognizing Christ as in some sense their head and leader. It undertakes to delineate the story of these in the aggregate; and with regard to the distinctions between them, and their pretensions to condemn and exclude each other, it confines itself to narrative, without attempting adjudication.

Another limitation has to be introduced into the definition of church history, when regard is had to the exact point of time at which it ought to begin. The church did not come into full-formed existence in a moment. Regarded as a community with more or less of an organization upon a Christian basis, and conscious of itself and of its aim in the history of the world, it was the result of the activity of Christ and his more immediate apostles and followers. The history of what they did in giving existence to the church, as such, is a different thing from the history of the church when once existing in that character. The case resembles the difference between embryology and biography in the history of the individual. The precise point of time at which the formative activity of the church founders issues in the actual church is probably to be determined by the emergence of the consciousness of a common Christian life and aim among the separate communities originally established by apostolic labour. By some writers this is placed as low as the destruction of Jerusalem, by others as high as the first rallying of Christ's

followers after his own disappearance from the world. In any case church history is relieved of a large amount of work with which it is sometimes burdened, but which does not properly fall to its share.

What church history has to do within the limits thus indicated will perhaps be best understood by considering its province as a department of scientific theology, and its relations to the theological disciplines with which it stands most closely connected, those, namely, of dogmatics and the history of doctrine. Strictly speaking, the history of doctrine is part of the history of the church. To exhaust its task, a history of the church must embrace at least *five* departments of inquiry and narrative,—one connected with the external relations of the church to the world at large and its political institutions, the remaining *four* treating of developments and relations internal to the church itself. (1) The **PROGRESS** of the church must be described, either positively, in respect of its advance, or negatively, with reference to its retrogression, at any given period. To exist at all, it must exist under one or other of these conditions; it must be either attaining or missing, approaching or receding from, its rightful influence on the social condition and political organization of mankind. (2) Its **CONSTITUTION** must be described. The church exists as such, in virtue of its constitution. It is not the church until it is to some extent organized, and the growth and forms of this organization must be recorded. (3) The **DOCTRINE** of the church at the various points of its development must be set forth. Doctrine is the full and finished expression of conviction, and since the church owes its existence to certain convictions, some religious, some moral, the history of doctrine occupies the very central position of the church's history. (4) **WORSHIP**, under one form or another, is an essential development of church life, as well as one of the modes in which it announces its existence, and calls for historical recognition. (5) **LIFE**, as exhibited in the number and character of the members of the church, completes the division of the matter of its history. Doctrine and worship are directed to certain practical ends, either of making proselytes to the church, or of perfecting the character of those who already belong to it, and any such results must be collected and presented both in their numerical and their moral aspects.

But while the history of the church, in the strict and comprehensive sense, must treat fully these various classes of activity, there is a narrower, if also a somewhat looser sense in which it may be taken, for ends of practical convenience. We may distinguish between the organization and its life, between the church and Christianity. On this view, doctrine, worship, and life fall to be treated collectively by the history of the Christian religion or in separate histories, while the history of the church becomes a narrative of the successes or defeats experienced in the world by the Christian community and the varying forms of its constitutional framework, with only such allusions to the internal and religious side of its life as are necessary to explain its constitutional changes and external fortunes. By this division it becomes possible to treat both the inner and the outer sides of the subject, each for itself, and therefore more fully and vividly. In this way, since doctrine lies at the foundation of worship and life, and even constitution, the history of doctrine becomes the key to the whole history of the church, and the indispensable preliminary to a scientific comprehension of it. The life and action of the church in the world are simply the expression of the ideas by which it is governed; and it is the business of the historian of doctrine to record the vicissitudes and developments of these, whether he writes in the interests of mere knowledge and with absolute impartiality, or, as is more

common, though less scientific, with a bias in favour of a certain class of ideas, all divergences from which he chronicles as errors. The difference between church history read in the light of the history of doctrine and apart from it is like the difference which the phenomena of health and disease present to minds that possess or that want an acquaintance with the principles of physiology.

Church history, including or co-ordinate with history of doctrine, stands in an important relation to dogmatics. Dogmatics (which also contributes the formal as well as, in part, the material element in Christian ethics) is charged with the scientific statement and proof of whatever is held to be the true doctrine. In the sphere of statement the history of the church is necessary, both as introduction and commentary. Doctrine is a growth, an evolution of part after part, under the influence of special circumstances at special times. The full meaning of doctrine can therefore often be understood only in the light of its antithesis, and its relative importance as essential or accidental ascertained only from the practical crisis which demanded its declaration,—aids for which recourse must be had to the history of the church and its doctrine. As regards, therefore, the scientific articulation, proportioning, and interpretation of doctrine, church history stands in the position of an essential preliminary to dogmatics.

As regards actual church life, and any new expression of it in worship, constitution, or propagandist effort, that assumes to be based on scientific principle, the history of the church is indispensable, not only for the extended view of present circumstances that may be requisite, but also to enable the church fully to know and judge its own mind. The existing church consciousness is the product of all the past, and cannot be fully understood and criticized except in the light of its history.

2. The **SOURCES** of church history are either Monumental or Documentary. Monumental sources yield such intimations of past transactions as are to be found on avowed monuments, memorial tablets, gravestones, churches, and other public edifices or private dwellings, or upon articles of antiquity, seals, crucifixes, furniture, vestments, pictures, coins, weapons, &c. Documentary sources, as their name implies, include all manuscript or printed information, whether originals, copies, or oral traditions committed to record. In point of comparative value, the documentary sources are, of course, the more important, being, from the nature of the case, so immeasurably richer in information. At the same time, within their own range, monumental sources are often more valuable than documentary. Forgery has less chance of success in monuments than in documents; and certain classes of facts are frequently commemorated on them which writers do not think of recording. Dates and names and the like have been fixed by inscriptions on coins, &c., where documents have proved defective or wrong.

Documentary sources may be divided from the point of view of their destination into (1) Public and (2) Private, and from that of their authorship into (3) Direct and (4) Indirect. Under the head of public documents we have all deliverances of an official character, such as decrees of councils, Papal bulls, civil legislation affecting the church, rules of life for monastic institutions, liturgies, confessions of faith, and even sermons, theological treatises, &c. Private documents, again, consist of personal memoirs and journals, letters, secret correspondence, and papers not originally intended for the public eye. Then by direct documentary sources are meant those in which we have the actual word of a writer or actor in any event testifying to the nature of the opinion or transaction about which information is desired. Indirect documentary sources are those in which we obtain information about the opinions or

an author or the actions of any historical character, not from statements of his own, but from the testimony of some one else about him. Thus a letter of Constantine would be a direct document in reference to some purpose or performance of his own, while it might be an indirect document in reference to the history or opinions of Athanasius or Arius.

In collecting and sifting these sources so as to place all and only the right materials available before the church historian, recourse must be had to the sciences of antiquities, bibliography, and diplomatics. Antiquities, in its various divisions of numismatics, ecclesiology, heraldry, &c., marshals all the relevant monumental testimony and discriminates the spurious from the genuine; bibliography, taken in its widest sense, as the science which enumerates, classifies, and values all that has been written upon the various heads of human knowledge, states what documentary material is likely to be available at the different stages of inquiry, and where it is to be found; while diplomatics, or the science of documents, defines the genuineness, completeness, and general trustworthiness of the material so indicated.

Besides these more immediate sources there are collateral sources on which church history must draw in fulfilling its task. These are mainly ecclesiastical philology, the general history of Christendom, with ecclesiastical geography, statistics, and chronology. Ecclesiastical philology points to acquaintance with those languages, more particularly Greek and Latin, in which the chief part of the historical materials is expressed, whether as original or translation. The necessity of this is obvious. Besides this, some knowledge of the general history of Christendom is indispensable to an understanding of the history of the church, just as the special history of the church is essential to a comprehension of general history. The events of the church and of the world are so inextricably bound up together that the one are intelligible only in the light of the other. Hence the history of policy, law, philosophy, literature, and art must be laid under contribution in constructing a full history of the church. Clear treatment further requires acquaintance with ecclesiastical geography and statistics, the distribution of the world into Christian and non-Christian sections, divisions by patriarchates, dioceses, parishes, &c., and the physical characteristics and social habits of different localities. And along with this, ecclesiastical chronology, the correct arrangement of persons and events, both in their contemporaneous appearance and in their succession to others, is requisite to complete the list of auxiliaries to church history.

3. After the Sources, the METHOD of dealing with them, so as to produce history, falls to be considered. Method here comprises two main divisions,—(1) Criticism and (2) Construction. In the criticism of the materials two qualities have to be called into exercise,—the judicial faculty and historic insight. The judicial faculty has to determine two questions,—first, How far are the sources to be relied on? and second, If to be relied on, what do they really say? The question how far the sources are to be relied on depends on both the ability and the willingness of the writer to tell the truth. As to his ability, we must consider how far he was in a position to be aware of the facts, and to what extent his judgment and penetration are to be trusted in matters of fact. He may have been credulous, or an incompetent or careless observer, or he may have been so greatly biased by party feeling or personal animosity as to be incapable of forming an impartial opinion. Then, besides the writer's ability to tell the truth, there must be considered further his willingness to tell it. A writer may be perfectly able to tell the truth, if he liked. But he may not like. He may have reasons or motives of his own for withholding the truth, or even for substituting

untruth. In using his sources the historian must be able to judge exactly how far they are in these respects to be relied on. Then supposing he has decided that they may be relied on in a given degree, he must next be able to take from them precisely the testimony as to past fact which they convey, neither more nor less. That is to say, he must be impartial,—capable of holding the scales of fairness evenly, of controlling his mind so as to prevent any preferences of his own from weakening or distorting the statement of fact derivable from his authorities, in favour of his own opinions. The historic insight, which, in addition to the judicial faculty, is essential to the thorough criticism of the materials, is the power of fully comprehending the significance and connection of the facts yielded by the sources, by realizing the point of view of the actors or writers to whom the facts dealt with are due, and determining their import as related to a general philosophy of history, and embraces three forms of insight, which may be called philosophic, psychologic, and Christian. Philosophic insight implies, first of all, ability to enter into the various forms of speculative thought, metaphysical, ethical, or whatever else, that have appeared within the church's history, and have in greater or less degree influenced its movements. It implies further an ability to see the whole recorded facts and their connection under the light of the philosophy of history; but as this obviously cannot take place until the facts in themselves have been completely understood, this aspect of philosophic insight will come into play only when the others have discharged their function. By psychologic insight is meant knowledge of human nature affected by scientific observation of mind and its operations. The facts of history are created by individuals, and each of them may be interpreted as an exhibition of the will and intellect, of the general subjective state of some one man or body of men. This subjective state, again, may be accounted for, in part at least, by the action of certain preceding facts upon the mind of the man or men in question, which facts again are to be explained as a manifestation of the mind of some preceding man or men, and so on. In short, history is the product of human nature, affected by and dealing with certain external data, natural or supernatural, furnished by God; so that, to understand it, there is needed the ability to place before the imagination what human nature is at any point in or between the moral extremes of goodness and wickedness, and the intellectual extremes of wisdom and folly. By Christian insight is meant special capacity for sympathizing with the spirit and ideas of Christianity. What we have in the history of the church is centrally the mind and motive of Christ organizing itself in a living institution that it may enter into conflict with the evil of the world, and by persuasion subdue it to willing submission. To comprehend the development of facts produced during the activity of such an institution, there would seem to be requisite at the very outset an understanding of the thought and feeling that constitute its inner life; that is to say, there must be an intelligent sympathy with the spirit of the New Testament, which, as the primitive record of the action of Christ's spirit and career, is, were it on no other ground, the authoritative exposition and medium of the mind of Christ. And not only must there be this acquaintance with the ideas and spiritual impulses of the New Testament, but there would appear to be also necessary some experience of their power. If Christianity be not merely a series of intellectual propositions, but a spiritual force penetrating to the motives of the soul, it can scarcely be adequately comprehended by any one who has not known what it is to yield in his innermost being to Christian influences. For while many of the greatest occurrences in the history of the church have sprung from the spirit of

evil, and are fully intelligible to the historian only in virtue of his own experience of at least germinal evil, a vast number of other events are due to men who were in their degree reproductions of Christ, animated by the single desire to bring about what they believed he would have sought had he been in their circumstances, and ready to submit to any sacrifices that might be demanded as the price of success. To understand fully the genesis of transactions arising out of such a spirit would seem possible only to those who possess the key to their explanation in what is essentially Christian experience.

The historical materials having been subjected to criticism of the kind indicated, the way is open for the actual construction of the history. Construction embraces arrangement, proportion, and style. Under the head of arrangement there falls to be considered how the material of history is to be divided so as to give the most complete and just conception of what has occurred within the time to be dealt with. It is obvious that we cannot take in all the events of so great a narrative at one view. We must break it up into a succession of parts, and study each by itself; and the question is on what principle should this partition of time be made. In history the element of time has to be considered in two phases—succession and contemporaneity. Biography properly records succession alone. An individual can do only one thing at once; whereas a society like the church, consisting of a number of individuals, can be doing a number of different things at one and the same time. Proselytism, worship, the development of sacred art, the formation of doctrine, the activities of Christian life, may all be in progress simultaneously. Biography is a thread; history is a web, in which time is broad as well as long. In dividing the breadth or contemporaneous movement of the church, no other classification is possible than that natural one, which has already been mentioned, into some such categories as progress, constitution, doctrine, worship, and life. But in dividing history lengthwise, there may be a choice of principles, unless indeed it be denied that events hang together by a causal nexus. The time was when such a denial would have been maintained, when the history of the church was regarded as determined by a series of special interpositions of the Divine will, resulting in a succession of events among which it was not given to human reason to trace the sway of law. That view of things, however, has passed away, and for the modern mind, whatever may be thought of the origin of the church, its history is a sequence of cause and effect, in which the moving forces and tendencies can be accounted for, and their operation traced as the evolution of internal ideas dominating the events of distinct periods, and shaping them into orderly processes. Hence arises the possibility of a natural and an artificial division of history. Arbitrary periods such as centuries or half centuries may be chosen, and an acquaintance with the events of one of such sections acquired before proceeding to those of its successor. This is the artificial mode of division. It has no reference to the nature of the progress made by the church as a growth which is determined by an inner formative thought. But a division in harmony with this latter view of things is possible. There are for instance in the history of the church greater or smaller crises continually occurring, for which the intermediate events are preparations; or there is a certain character stamped upon one era different from that which belongs to another. The conversion of Constantine, or the sitting of the Councils of Nice, Trent, or the Vatican, is an instance of the one; the prevalence of the ancient and patristic, the mediæval and scholastic, the modern and scientific mode of thought is an instance of the other. Divisions of the matter of church history according to such events or

characteristics are natural divisions; they correspond with the nature of the thing, and rise out of the subject itself, instead of being imposed upon it from without, like the division into centuries and half-centuries, which in many cases may lead to a misconception of the meaning of history, cutting into the very middle of a development before it has reached its climax, so rendering both parts unintelligible, or at all events misrepresenting both. The natural division is thus much better adapted than the artificial to impart a view of the subject as it exists in its real parts. If a framework is to be taken to pieces, with a view to understand its structure, it ought to be separated at the joints, not broken, as it were, across the bones. At the same time, within the great natural periods, once their limits and determining conditions are clearly understood, the subdivision into more or less artificial periods of years facilitates the taking up of all the requisite information as we go along, very much as in a long journey, when once we know the direction or destination of travel, it is necessary to divide the intervening space into such arbitrary stages as are suitable to our footsteps or other modes of progress.

Proportion has to be considered in the construction of church history for two reasons,—one depending on the relative prominence of different phases of church life at different times, the other on the relation of church life to its territorial or sectarian distribution. As regards the first of these reasons, while the categories of progress, constitution, doctrine, worship, and life furnish, in the order of interdependence, a summary of headings under which the movement of the church at any time may be exhaustively described, it is obvious that whichever of these categories represents the main feature of the ecclesiastical condition during any particular period should receive a corresponding prominence and fulness of treatment in the history of the period. At one time the progress of the church in the conquest of adverse religions may be the most striking thing about it, at another it may be the formation of doctrine, at another development of ritual, and so on. To be a faithful reflex of the facts, history must proportion its treatment to the case, assigning the principal place to the principal thing, and grouping the rest around it. The other reason for observing proportion in historical treatment lies in the territorial and sectarian distribution of the church's life. National almost necessarily imply ecclesiastical distinctions. The German, Swiss, French, English, Scottish churches, &c., have all separate domestic histories, so that while one has been growing in one direction, another may have been growing in a direction entirely different. Controversial differences have had the same result. The Eastern and Western churches for example, ever since the period of the final schism, have had in each case a self-contained development. The same remark applies also to Protestantism and Catholicism, in regard to that vast extent of thought and action in which they are separated from one another. This state of things compels many to specialize their work, and to pursue one national or sectional stream of ecclesiastical movement to the end, before exploring another; but wherever church history on anything like the universal scale is attempted, the writer must determine where and how the vitality and force of the church are for the time evolving themselves most characteristically and influentially, and give to such localities or forms the central position in his delineations. Thus in the earlier centuries, the East, the conquest of paganism and the rise of theology may claim his chief attention; in the Middle Ages, Rome and the Papacy, or scholasticism; in the Reformation period Germany may seem the centre of Christendom; in the modern period the disintegrating influence of philosophy and historical criticism may be regarded as the leading phenomenon, &c.

the statements in the text are based. As a means by which a careful student may rapidly test the value of historical conclusions, Gieseler's work has no superior. A year afterwards, Neander, inspired by Schleiermacher, afterwards epitomized by Guericke, and popularized by Hagenbach, issued the first instalment of his *General History of the Christian Religion and Church*. The distinguishing characteristic of this great work is its emphatic recognition of the function of history to explain events from their causes, as well as to state them in their objective reality. Neander treats ecclesiastical institutions and events as the necessary outgrowth and embodiment of the peculiar condition of Christian ideas and aims at the given time, and his undoubted and profound sympathy with the essential spirit and conception of Christianity, and capacity for tracing these under various forms of manifestation, enable him to throw a light upon the facts of the church's history, and to account for them in ways that are always interesting, sometimes even fascinatingly so, whatever opinion may be ultimately taken of their critical accuracy. Ranke, although his work has been confined to special histories, has exercised a great influence on the course of scientific church history. In his *History of the Popes* (1834-6), and especially in his *German History of the Reformation Period* (1839-47), he has furnished a brilliant example of the method in which ecclesiastical facts in all their relations are to be investigated, arranged, and explained. But probably no writer of the century has left a deeper impress on the method of studying and constructing church history than F. C. Baur, who, from 1835 to his death in 1860, gave to the world a series of works bearing on this subject, and culminating in his great *Church History*, which, for wealth of erudition and variety of genius, give him a unique position even in the land of great scholars that claims his fame. Whatever may be thought of his special conclusions, it is certain that since his labours, the study of the history of Christianity, especially during the earlier centuries, must be a far more thorough and profound thing than ever it was before. He may, as has been said of him, be too unwilling to admit the possibility of an entirely new germ of spiritual force in the inception of Christianity, he may be too much warped by a Hegelian tendency to resolve all historical movements into an alternation of antagonisms and conciliation, but his vast mastery of details and marvellous power of marshalling far-scattered facts in support of a startling and unexpected theory have necessitated a new and more penetrating scrutiny of early sources, which is far from being completed at this hour. Some of his results will probably be found of permanent value, and it is certain that in his conception and working out of the history of dogma he has explained the formation of general ideas in theology, and their power in shaping the course of the church's history, in a way that was needed to counterbalance and supplement at once the objectivity of Gieseler, and the sentimentality of Neander.

In the Roman Catholic Church, of course, scientific church history in the true sense is not to be expected; but there have been movements towards it, and painstaking contributions have been made, which may prove useful in the hands of an unfettered writer. The great collectors of the Acts of Councils, Labbé, Hardouin, and above all, Mansi, we owe to the Catholic Church. Stolberg, Katerkamp, Ritter, and Locherer have written the history of their church from separate points of view that are full of interest, while the names of Möhler, Döllinger, and Montalembert do not need to be further characterized. The manuals of Alzog and Krauz are of great value. Hefele's *History of Councils* is a mine of thoroughly sifted information.

Besides the powerful but one-sided ecclesiastical chapters of Gibbon, the original researches of Routh and Burton, and the splendid works of Milman on Christianity and Latin Christianity, replete with critical sagacity, graphic power, and philosophic insight, Great Britain has not produced anything that deserves to be set beside the Continental masterpieces. Much valuable material in the form of historical monographs, biographies, and archaeological issues by individuals and societies has been produced both in England and Scotland, but nothing that deserves the name of a great church history, whether special or universal. The tractarian movement has stimulated a certain amount of antiquarian research, and Canon Robertson of Canterbury has compiled a useful history of the church to the period of the Reformation.

For the full bibliography of the subject, reference may be made to such manuals as those of Hase and Kurtz, which have been translated, and more particularly to the latest edition of Hagenbach's *Encyclopädie u. Methodologie der Theologischen Wissenschaften*, as also to the same author's article "Kirchengeschichte," in Herzog's *Real-Encyclopädie*, and Hefele's in Wetzer and Welte's *Lexicon*. (R. W.)

CHURCHILL, CHARLES (1731-1764), the satirist, was born in Westminster, where for many years his father held the curacy and lectureship of St John's. At eight years of age he was sent to Westminster School, where he made no figure except by his irregularities. At nineteen he applied for matriculation at Oxford, but was rejected. He was afterwards admitted of Trinity College, Cambridge, which he quitted immediately, and to which he never returned. A Fleet marriage contracted about this time obliged him to retire, first to his father's house, and afterwards to Sunderland, where he began to study for the church. In 1756 he was ordained priest, and officiated in his clerical capacity at Cadbury, in Somersetshire, and at Rainham, in Essex, at which latter place he was obliged to eke out his living by teaching. On his father's death in 1758, Churchill succeeded to his curacy and lectureship, and officiated for some time, employing his leisure in reading the classics at a ladies' boarding school and with private pupils. But his innate Bohemianism was too strong to allow of such a quiet way of life for long together. He gave himself over, in conjunction with Lloyd the poet, who afterwards died in the Fleet, to every kind of loose living, ran into debt, was pursued, and had a composition of five shillings in the pound paid by the father of his boon companion. Part of the experience gained during this period he used in his first published poem, *The Rosciad* (1761), a reckless but amusing satire on the artists of the several London theatres, which was issued anonymously. The success of this work was astonishing; Churchill was not backward in avowing its authorship; and the same year he avenged himself on its critics in *The Apology*, a poem in which he adopted the systematic and scurrilous personality that was to make him rich and famous. He was at this time in his thirtieth year, and in the plenitude of his powers. His conduct, which had scandalized his parishioners, drew down the censure of his dean. The satirist at once resigned his charges, discarded his cassock and bands, and appeared *en viveur*. He separated from his wife, and apologized in the poem of *Night* (1762), which is a sufficiently impudent piece of irony; and in the same year he published, at irregular intervals, four books of Hudibrastic doggerel called *The Ghost*, in which Samuel Johnson and his associates are ridiculed with some point and much brutality. An acquaintance with John Wilkes, which seems to have ripened rapidly into friendship, gave occasion for two of Churchill's strongest efforts, *The Prophecy of Famine*, a violent attack on the Scottish influence and character, and *The Epistle to Hogarth*,—the latter, which is said to have hastened the great artist's death, being a reply to Hogarth's two carica-

tures of Wilkes and his friend. In 1763 appeared *The Conference*, a second apology; *The Duellists*, three books of loose octosyllabics, called forth by the duel between Wilkes and Martin; and *The Author*, a satire of more general scope. These were followed in 1764 by *Gotham*, another piece of indiscriminate censure; by *The Candidate*, an attack on Lord Sandwich; by *The Times*, the last of Churchill's successes; and by *The Farewell* and *Independence*, which are worth little except as proofs of their author's decay. In the October of the same year he accompanied Humphrey Cotes to Boulogne, where Wilkes was then in exile, and died there of fever in a few days. He left some property, the proceeds of his writings, and bequeathed the editorship of his poems, with the material for illustrations and notes, to John Wilkes, who contrived to elude the bequest.

Churchill was a literary bravo, a man who liked broils and beating, and who was at the same time not indifferent to the rewards earned by the conflict. His satires are generally rough and loose in texture, disjointed in structure, and insolent in tone. They are full of good metal, it is true, but the ore lies heaped over with too much schist to repay research. His extreme facility of composition is perhaps a reason for this, as it is a reason why, writing from day to day, he should have gained and kept the public favour. Cowper praised him, but at best he was but an admirer and imitator of Dryden.

See Churchill's *Complete Works*, London, 1774, 3 vols. The best edition of the poems is that of Tooke, London, 1804, 2 vols., which has been reprinted (1844) in the Aldine Poets.

CHURCHILL, JOHN, first duke of Marlborough. See MARLBOROUGH.

CHURCHYARD, THOMAS (1520–1604), "the Nestor of the Elizabethan heroes," was born at Shrewsbury in 1520, and was educated at Oxford. At seventeen he went to court, where he roistered through such money as he had. He then became attached to the earl of Surrey, applying himself during his three or four years of service to books, music, and the practice of poetry. He served his first campaign in Flanders (1542–1544) against the French, and his second (1547) in Scotland. He fought at Pinkie, but was captured next year at St Monance, and did not return to England till 1550. A tract called *David Dicar's Dream*, written at this time, not only involved Churchyard in a fierce quarrel with a contemporary scribbler, but brought down on him the censure of the Privy Council; he only escaped the pillory through the interest of his patron, the duke of Somerset. A third campaign took him to Ireland, whence he returned in 1552. Having been unsuccessful in a love suit, he once more betook himself to the Continent, to serve his fourth campaign, at Metz and elsewhere, under the great emperor. His absence extended over three years. On his return he began writing harder than ever, dedicating two of his works to Queen Mary. The war with France made him a lieutenant in the English army, and at Guines he acted as mediator between the besieged and the besiegers. He next addressed a poetical appeal to Elizabeth; he got nothing, however, but fair words, and had to write his *Tragedie of Lord Mowbray*, a contribution to the *Mirror for Magistrates*. He fought at the league of Leith in 1560; he again attempted fortune as a courtier; and he went off to Ireland, campaigning under Henry Sidney. In 1566 he wandered to Antwerp, where he headed a great force of religious partizans; but he speedily had to fly the country by reason, he says, of his extreme moderation. Next year he went back as one of Oxford's agents, returning to England in 1569, when he married. In 1593, after another journey to Scotland, where he witnessed Morton's execution, Elizabeth gave him a pension; and eleven years later, immediately after the publication of

his last work, the *Blessed Baln to Search and Salve Sedition*, he died. Churchyard seems to have been an active, garrulous, and cheerful adventurer. Strype praises him as a good soldier and poet and a man of honest principles. Of his multifarious publications the *Legend of Jane Shore* is most highly esteemed, while the *Worthinesse of Wales* (1587) and *Churchyard's Chippes* (1575) have been reprinted,—the former in 1776, the latter, by Mr Chalmers, in 1817. See D'Israeli, *Calamities of Authors*, and Minto, *Characteristics of English Poets*.

CHUSAN, the principal island of a group situated off the eastern coast of China, in 30° N. lat. and 122° E. long., and belonging to the province of Che-keang. It lies N.W. and S.E., and has a circumference of 51 miles, the extreme length being 20, the extreme breadth 10, and the minimum breadth 6 miles. The island is beautifully diversified with hill and dale, and well watered with numerous small streams, of which the most considerable is the Tungkeang, falling into the harbour of Tinghae. Most of the surface is capable of cultivation, and nineteen-twentieths of the inhabitants are engaged in agriculture. Wherever it is possible to rear rice every other product is neglected; yet the quantity produced is not sufficient for the wants of the inhabitants. Millet, wheat, sweet potatoes, yams, and tares are also grown. The tea plant is found almost everywhere, and the cotton plant is largely cultivated near the sea. The capital, Tinghae, stands about half a mile from the southern shore, and is surrounded by a wall nearly three miles in circuit. The ditch outside the wall is interrupted on the N.W. side by a spur from a neighbouring hill, which projects into the town, and forms an easy access to an attacking force. The town is traversed by canals, and the harbour, which has from 4 to 8 fathoms water, is land-locked by several islands. Temple (or Joss-house) Hill, which commands the town and harbour, is 122 feet high close to the beach. The population of the town and suburbs of Tinghae, which at the commencement of 1843 was about 27,500, had increased in 1846 to above 35,000. The population of the entire island is estimated at 250,000, of which the capital contains about 40,000. Chusan has but few manufactures; the chief are coarse cotton stuffs and agricultural implements. There are salt works on the coast; and the fisheries employ a number of the inhabitants. In Tinghae a considerable business is carried on in carving and varnishing, and its silver wares are in high repute. The principal exports are fish, coarse black tea, cotton, vegetable tallow, sweet potatoes, and some wheat. Chusan was occupied by the Japanese during the Ming dynasty, and served as an important commercial entrepôt. It was taken by the British forces in 1840 and 1841, and retained till 1846 as a guarantee for the fulfilment of the stipulations of the treaty. It was also occupied by the English in 1860. See plan in *Jour. of Royal Geogr. Soc.*, 1853.

CHUTIA or CHOTÁ NÁGPUR, a division or commissioner'ship of British India, under the lieutenant-governor of Bengal, comprising the districts of Hazáribágh, Lohárdágá, Mánbhúm, and Sínhbhúm, and the seven tributary states which constitute the South-West Frontier Agency, lies between 21° and 25° N. lat. and 82° and 87° E. long. It is bounded on the N. by the province of Behar, E. by the Bengal districts of Bánkurá and Midnapur, S. by the Orissa Tributary States and the Central Provinces, and W. by the independent state of Rewá. Of its area of 43,901 square miles a large portion is occupied by hills and jungle, and the population is very sparse. The most important peak, Paresnáth, with its Jaina temples, has a height of 4400 feet. The Chutiá Nágpur plateau is an offshoot of the great Vindhyan range, and its mean elevation is upwards of 2000 feet above the sea level. In the W. it rises to 3600 feet, and to the E. and S. its lower steppe,

from 800 to 1000 feet in elevation, comprises a great portion of the Mánbhum and Sinbhum districts. The whole is about 14,000 square miles in extent, and forms the source of the Barákhá, Dámodar, Kásái, Subanrekhá, Baitarani, Bráhmání, Eb, and other rivers. *Sál* forests abound. The principal jungle products are timber, various kinds of medicinal fruits and herbs, lac, *tasar* silk, and *mahuá* flowers, which are used as food by the wild tribes and also distilled into a strong country liquor. Coal exists in large quantities, but is at present only worked on a small scale on the Hazáribágh district. Formerly gold was washed from the sands in the bed of the Subanrekhá River, but the operations are now almost wholly abandoned. Iron-ores abound, together with good building stone. The population in 1872 was 3,825,571, residing in 25,766 villages or townships and 752,287 houses. Of these the Hindus numbered 2,567,292, or 67·1 per cent.; Muhammadans, 169,006, or 4·4 per cent.; Christians, 15,798, or 4 per cent.; persons of unspecified religion, 1,073,475, or 28·1 per cent. These last consist of non-Aryan tribes who were driven from the plains by the Hindus and took refuge in the mountain fastnesses of the Chutiá Nágpur plateau. The principal of them are Kols, 292,036 in number; Santáls, 220,096; Uráons or Dhángars, 208,343; Mundás, 190,095; and Bhumij, 128,289. These tribes were formerly turbulent, and a source of trouble to the Muhammadan governors of Bengal and Behar; but the introduction of British rule has secured peace and security, and the aboriginal races of Chutiá Nágpur are now peaceful and orderly subjects. Of late years missionaries have worked hard among them, and several thousands of the Kols and Santáls have accepted the Christian faith. Only six towns contain upwards of 5000 inhabitants, viz., Ránehí, 12,086; Hazáribágh, 11,050; Iehak, 8999; Chatra, 8818; Puruliá, 5696; and Raghunáthpur, 5380. The principal agricultural products are rice, Indian corn, pulses, oil-seeds and potatoes. A small quantity of tea is grown in Hazáribágh and Lohárdágá districts. Lac and *tasar* silkcloth are largely manufactured. The revenue of the British portion of Chutiá Nágpur in 1870 was £101,651, the expenditure £79,472. Of the total revenue the receipts from land amounted to £23,698. The police of the British districts consisted in 1872 of 1590 officers and men of the regular force, maintained at a cost of £31,131; 172 officers and men of the municipal police, costing £981; 15,104 men of the village watch, costing £17,592; the total strength being 16,866 officers and men, and the total cost £49,705. In 1872-73, the Educational Department inspected 571 schools attended by 15,871 pupils, and the total cost of Government for the education of the people was £2371. The climate of Chutiá Nágpur is dry and healthy.

CHUTIÁ(CHOTÁ)NÁGPUR TRIBUTARY STATES.

These are seven in number,—Sirguja, Udaipur, Jashpur, Gangpur, Bonái, Koriá, and Chang Bhakár. At the decline of the Marhattá power in the early part of this century these estates came under British protection. They are now under the political superintendence of the commissioner of Chutiá Nágpur, and the charge of them constitutes what is known as the South-West Frontier Agency. Before the rise of the British power in India their chiefs exercised almost absolute sovereignty in their respective territories. The Rájás now pay a light tribute to the British Government, and are invested with magisterial authority to punish offenders by fine not exceeding £5 or by imprisonment not exceeding two years. The states are mountainous, thinly cultivated, and inhabited for the most part by wild aboriginal tribes. They cover an area of 15,419 square miles, the largest states being Sirgujá and Gangpur. Their aggregate population amounts to 405,980 souls, giving an average of 26 persons to the square mile. No towns exist in the

Tributary States, and only three villages contain more than 1000 inhabitants. The following is a brief description of each of the States:—

(1.) Sirgujá, the largest, lies between 22° 30' and 24° N. lat., and 82° 35' and 84° 10' E. long. It is bounded on the N. by the independent state of Rewá and the districts of Mirzápur and Lohárdágá, on the E. by the district of Lohárdágá, on the S. by the Biláspur district of the Central Provinces and the states of Udaipur and Jashpur, and on the W. by the state of Koriá. It is very hilly, with elevated table-lands affording good pasturages, and cut up by numerous ravines. The rivers are the Kanhar, Rer, Mahán, Son, and Santeh, the last being formerly known as the Diamond River. Hot springs exist in the state. Extensive *sál* forests cover a large area, affording shelter to herds of wild elephants, antelopes, bisons, buffaloes, and many sorts of deer, and also to tigers, bears, and other beasts of prey. The area is 6103 square miles; the population in 1872, 182,831 souls, residing in 1295 villages and 36,463 houses:—classified, according to religion—Hindus 68,789, or 37·6 per cent.; Muhammadans 1370, or 8 per cent.; aborigines of the Dravidian stock 73,256, of the Kolarian stock 39,416, total 112,672, or 61·6 per cent. The principal agricultural products are rice, Indian corn, and other inferior cereals, pulses, oilseeds, and cotton; the articles of export—clarified butter, grain, oilseeds, lac, gums, jungle silk cocoons (*tasar*), &c.; imports—brass and pewter vessels, piece goods, and ornaments. The places of trade are Bisrámpur, the capital of the state, Pratápur, and Jhilmilí. The total revenue of the estates in Sirgujá in possession of the different members of the chief's family is £7000; the rental of the personal estate of the Rájá, £3000; the expenditure on administration, £212. A small body of police is maintained by the Rájá, and he can at a short notice put himself at the head of 1000 fighting men. Sirgujá pays a tribute of £189 to the British Government.

(2.) Udaipur lies between 22° 3' and 22° 50' N. lat., and 83° 5' and 83° 50' E. long., and is bounded on the N. by the Mainpát plateau in Sirgujá, on the E. by Jashpur, on the S. by Ráigarh, and on the W. by Biláspur in the Central Provinces. Country hilly, diversified with plains, and possessing one of the most extensive coal fields in India. Principal river, Maud. Area, 1051 square miles, of which 121 are cultivated. Population—27,708:—Hindus, 7351; Muhammadans, 118; aborigines, 20,239. Principal villages—Rábkoh, the capital, and Dorkí. Exports—cotton, resinous gums, oilseeds, rice, wild arrowroot, iron, and a small quantity of gold, obtained by washing. Udaipur came under the British protection in 1817, and now pays an annual tribute of £58.

(3.) Jashpur, the most populous of the states, lies between 22° 20' and 23° 15' N. lat., and 83° 30' and 84° 30' of E. long., and is bounded on the N. and E. by the district of Lohárdágá, on the S. by the states of Gangpur and Udaipur, and on the W. by the state of Sirgujá. The country is divided almost equally into high and low lands. The only river of importance is the Eb, in the bed of which diamonds are found, and from time immemorial its sands have been washed for gold. Jashpur iron, smelted by the Kols, is highly prized. Jungles of *sál* forests abound, harbouring elephants, bisons, and other wild beasts. Jungle products—lac, silk-cocoons, and beeswax, which are exported. Area, 1947 square miles; population, 66,926:—Hindus, 11,498; Muhammadans, 423; aborigines, 55,005. Principal villages—Jashpur Nagar, the capital, and Sanoá. Agricultural products—rice, barley, Indian corn, and other inferior crops, pulses, oilseeds, hemp, flax, &c. The Rájá possesses an income of about £2000, and pays through the Sirgujá state a tribute of £77, 10s. to the British Government. Jashpur came under the protection of the British Government in 1818.

(4.) Gangpur extends from 21° 50' to 22° 30' N. lat., and 85° 10' to 85° 40' of E. long., and is bounded on the N. by Lohárdágá district, E. by the Sinbhum district, S. by Sambalpur and Bámrá, and W. by Ráigarh in the Central Provinces. The country is for the most part an undulating plain, broken by detached ranges of hills, one of which, the Mahávíra range, possesses a very remarkable and imposing appearance, springing abruptly from the plain in an irregular wall of tilted and disrupted rock, with two flanking peaks. The rivers are the Eb and the Bráhmání, formed here by the union of the Sankh and the Koel, both navigable by canoes. The Eb was formerly famous on account of diamonds found in its bed, and its sands are still explored for gold. One of the largest coal fields in India extends into the state. Jungle products—lac, silk cocoons, catechu, and resin, which are exported. Wild animals—bisons, buffaloes, tigers, panthers, leopards, hyenas, wolves, jackals, wild dogs, and many sorts of deer. Area, 2484 square miles; population, 73,637, viz., Hindus, 28,192; Muhammadans, 231; aborigines, 45,214. Principal village, Snádi, the residence of the Rájá. The soil is exceedingly fertile, yielding sugar cane, tobacco, rice, and other cereals, pulses, oilseeds, and cotton. The chief enjoys a revenue of about £200, out of which he pays £50 as tribute to the British Government, the connection of which with the state dates from 1803.

fore Jekyll, Master of the Rolls, and won his ease. In 1730 Mrs Oldfield died, and her loss was followed in 1731 by that of Wilks; Cibber, who had been named laureate on the death of Eusden, sold his share in the theatre, and retired from the stage, and only appeared thereafter on rare occasions. In 1742 occurred the quarrel with Pope, which resulted in the exclusion of Theobald and the elevation of Cibber as the hero of the *Dunciad*. At seventy-four he appeared on the stage for the last time as Panulph in his own poor tragedy of *Papal Tyranny*. His conversation (of which Johnson said that "taking from it all that he ought not to have said, he was a poor creature") was agreeable to the last, and he died as full of worldly honours as of years.

Cibber's reputation has suffered greatly from the acrid censure of Pope and the rough scorn of Johnson. There can be no doubt that he was by no means an unamiable character, and that he was deficient neither in wit, sense, tact, nor feeling. The little passages of dramatic criticism and reflection scattered through his *Apology*, while they prove his extreme perspicuity and excellence of experience, are perhaps the most delicate and subtle of their kind in the literature of his time; while the fact that his version of *Richard III.* should have kept the stage for a century is of itself no mean proof that his scenic sagacity and instinct were remarkable. As a dramatist, he has neither the broad humour and strong comic vein of Vanbrugh, nor the fine English and the masterfulness of Congreve, nor the frolicsome gaiety and airy fancy of Farquhar. His characters are flat; his plots are neither natural nor well conducted; his dialogue is often flippant. He attempted, moreover, to extract a highly moral end from his sympathetic studies of social weakness and impurity, and the result (particularly in his continuation of Vanbrugh's unfinished *Journey to London*) is not happy. His *Odes*, the subject of several of Johnson's keenest pleasantries, are wretched. His best work is the *Apology for his Life*, a book which the same critic declared to be a standing proof that any man might do well who was able and willing to keep to his own ground.

See *An Apology for the Life of Colley Cibber, Comedian* (London, 1822); Cibber, *Dramatic Works* (London, 1777, 5 vols.); Boswell, *Life of Samuel Johnson, LL.D.*; and Isaac D'Israeli, *Quarrels of Authors*.

CICACOLE, a town of British India, in the presidency of Madras and district of Ganjam, about 58 miles N.E. of the town of Vizagapatam, on the left bank of the River Nagawalli or Naglandi, a few miles from its mouth. It is an irregular mud-built place, but possesses several mosques and bazaars of some importance. Its principal manufactures are cotton goods and excellent muslins. There is a military cantonment a short distance from the now dismantled fort, and a small English church occupies the corner of the parade ground. A school where English is taught is supported by the London Missionary Society. The town formerly gave its name to one of the five Northern Circars. Its population is about 12,800.

CICERO, **MARCUS TULLIUS**, born at Arpinum (Arpino) on the northern border of the Volscian territory, 3d January 647 A.U.C., 106 B.C. His family was of equestrian rank, and his father, though living in retirement, was intimate with some of the public men of the day. The orator Crassus took an early interest in the young M. Cicero and his brother Quintus, and directed their education. As an orator, a statesman, and a man of letters Marcus became the most consummate specimen of the Roman character under the influence of Hellenic culture. He was first placed under the tuition of the Greek poet Archias, a teacher at Rome, with whom he read the poets and orators of Greece, composed in the Greek language, and also wrote Latin verse. This literary training he combined with study under the

two Scævolas, the augur and the pontifex, and from these Roman masters he imbibed the spirit of the national law and ritual. His aim was to prepare himself by liberal as well as technical training for the career of an advocate; but the Roman institutions required him to serve in the field also, and he took part in the campaign of Sulla against the Italian confederates in the year 87. Returning to the city he betook himself once more to the pursuits most congenial to him, and attended on the teaching of Philo the chief of the Academics, of Diodotus the Stoic, and of Molo a philosopher of Rhodes. Many teachers had been driven at that moment from the schools of Greece by the invasion of Mithridates. Cicero, at the age of twenty-six, pleaded a civil cause in the speech *pro Quinctio* (81 B.C.), and again in a criminal action against Roscius Amerinus in the following year. After these efforts, which brought him some distinction, he suddenly withdrew to Athens, on the plea of weak health, but probably to avoid the displeasure of the dictator Sulla. Here he studied under Molo and others, with a special view to the practice of declamation, and the management of his physical powers in a profession which made severe demands upon them. He travelled also through the Roman province of Asia, and stored up a vast amount of information in a mind singularly acquisitive and endowed with extraordinary facility of arrangement and expression, but with comparatively little fertility of invention or breadth and strength of character. Cicero was from the first an imitator and an adapter rather than an original thinker. He was throughout a follower rather than a leader in action as well as in speculation. His mental training disposed him specially to admire past models or cling to existing institutions, and he was always too easily subjected to the influence of characters stronger than his own. His position, indeed, as a new man, or a struggling candidate for political honours which neither his birth nor his means could naturally command, made it necessary for him to attach himself to the leaders of party; but his versatile talents soon rendered him a valuable adherent, and it speaks well for the times in which his lot was cast, amidst the deep corruption which pervaded them, that his honest and enlightened patriotism was on the whole appreciated and rewarded.

It was from policy, but partly also from his own kindly feelings, that the young orator, on resuming his profession, preferred to distinguish himself in defence rather than in attack. This course impressed the good-natured public in his favour. Moreover, the class from which the judges were taken, conscious that the position of defendants in a criminal suit might at any time be its own, was often glad of an excuse for screening public delinquents. It may be said that even the impeachment of Verres was rather a defence of the injured Sicilians than a hostile attack upon an individual, who was allowed to withdraw quietly from the city. Cicero's triumph in this famous cause (70 B.C.) raised him to the pinnacle of reputation. He had already attained the quaestorship (77 B.C.). He succeeded to the aedileship in 69, and became praetor in 68, a year memorable in his career for the passing of the Manilian law, which he warmly supported, by which Pompeius was constituted commander against Mithridates with extraordinary powers, in the place of Lucullus. Pompeius was at this period accepted by the oligarchy as their leader, though not without reluctance and distrust. Cicero gladly attached himself to their cause, and flattered himself with the hope of reconciling the senate with the knights by a more liberal and genial policy. Meanwhile he hoped, by favour of the dominant party, to attain the consulship. He found himself a candidate for that magistracy along with Catiline, a man of ruined character and already under suspicion of plotting against the state. Nevertheless he did not hesitate

to combine with him in his canvass, and to undertake his defence on a charge of malversation. Cicero obtained the consulship; Catiline was defeated, and thereupon betook himself to treasonable machinations. It was the business of his late ally to track these intrigues and defeat them. The vigour and courage with which Cicero conducted himself at this crisis won for him by popular acclamation the title of "Father of his Country" (63 B.C.) But the nobles ill requited the service he had done them. They now felt themselves secure in their ascendancy. They affronted Pompeius, they made light of Cicero, and allowed him to be treated contumeliously by a tribune, who, under pretence that he had condemned citizens unheard, forbade him to make the usual declaration of the services he had performed in his consulship. Cicero, in laying down his office, was only permitted to exclaim—"I swear that I have saved the state." Cæsar, at the head of the popular party, countenanced this affront; while Pompeius, perhaps a little jealous of the rising statesman, on his return from the East vouchsafed him no cordial support. The real weakness of his position was made painfully manifest to him. He would not consent, however, to remove to a distance, and declining to sue for the government of a province, devoted himself for a time mainly to literary pursuits, composing among other things a poem on the glories of his own consulship. Meanwhile the enemies he had made became more emboldened. Clodius, a worthless demagogue, assailed him with a formal charge for putting citizens to death summarily without appeal to the people. In vain did he assume the garb of mourning, and traverse the streets as a suppliant. The magnates stood coldly aloof, and the factions arrayed against him did not scruple to menace his scanty defenders with violence. Cicero was obliged to seek safety in flight, and withdrew to Thessalonica. Clodius obtained a decree of the people for his banishment 400 miles from the city, and the destruction of his house on the Palatine, the site to be devoted to the erection of a temple of Liberty (58 B.C.)

Pompeius and Cæsar had suffered Cicero to undergo this humiliation for their own purposes, but they were not disposed to submit to the arrogance of the upstart Clodius, who was now making himself generally obnoxious. In the following year they let it be understood that the persecution should cease. The partizans of Clodius raised tumults in the city, but they were speedily put down, and a resolution for the exile's recall was carried in the assembly of the people. Cicero had betrayed much weakness under banishment. The exultation with which he triumphed on his return was hardly more dignified. The senate, however, complimented him, by coming forth to meet him, and the state undertook the restoration of his mansion. The armed opposition of Clodius was met by a counter demonstration on the part of Milo, a no less turbulent instrument of the oligarchy. But Cicero now felt himself powerless in the presence of chiefs of armies and leaders of factions. He attached himself more closely to Pompeius, and devoted his eloquence to the defence of his patron's creatures, while he courted more and more the pursuit of literature in retirement. The attainment of a seat in the college of augurs on the death of Crassus (53 B.C.) placed him in a position of dignity well suited to the taste of a constitutional antiquarian. But Cæsar, though now absent in Gaul, was rapidly becoming a great power in the state, and Cicero did not fail to pay court to him also, proposing to celebrate his British wars in an epic poem. The death of Clodius (52 B.C.), whose slayer, Milo, he defended, relieved him from the apprehensions he had never yet shaken off. He accepted, though not without reluctance, the lot which assigned him the government of Cilicia for the year following. His conduct in this post seems to have been

highly meritorious. He checked the corruption of his officials while he preserved his own purity, and distasteful as warlike affairs were to his studious and quiet temper, he did not shrink from leading his troops against the restless mountaineers. His vanity induced him to pretend to a triumph for his success in these trifling operations; but in those degenerate days greater victories than his would have failed to secure such an honour, unless backed by the influence of the leaders of party, and neither Pompeius nor Cæsar was disposed to indulge him.

The civil war between these two rivals was now imminent. Cicero naturally threw himself into the ranks of the senatorial or conservative party, which was blindly following the lead of Pompeius; but he was coldly received by the violent men who ruled it, to whom his old-fashioned patriotism was utterly distasteful. Reluctantly and with much misgiving he quitted Italy in the train of the senate and consented to set up a shadow of the commonwealth on a foreign shore; while Cæsar attached to himself in the city, as dictator and consul, both the substance and the forms of constitutional power. After the disaster of Pharsalia and the rout of the senatorial forces, Cicero quickly threw aside his arms and returned to Italy, where Cæsar had left Antonius in command. He was soon relieved from apprehensions for his own safety by kind assurances from the victor, and while Cæsar was occupied in Egypt, Africa, and Spain, he withdrew altogether from public life. With his wife Terentia he had never lived happily; but he now took the step of repudiating her, which according to the ideas of the times caused no unfavourable remark, nor was it made matter of reflection upon him that he straightway married again his own ward Publilia, wealthy as well as beautiful. The young bride seems, however, to have contributed nothing to his domestic happiness, and her, too, he soon repudiated for the satisfaction she had seemed to evince at the death of his much-loved daughter Tullia. During this period, however, he abstained from making advances to Cæsar, and did himself honour by composing a panegyric upon Cato, to which Cæsar condescended to make an ill-tempered reply. But the conqueror's clemency to Marcellus at last won his heart, and now, after the death of Pompeius, Cato, and Scipio, with all the other chiefs of his party, he could not refrain from declaring warmly in favour of the new ruler. Cæsar felt the compliment, and repaid it by sparing at his instance the life of Ligarius. The conduct of Cicero at this critical moment was undoubtedly the most truly politic. Other republicans, such as Brutus and Cassius, who had espoused the senatorial cause with feverish zeal or angry factiousness, did not scruple to give their actual support to the new government, and to accept office under it, while they secretly chafed against it and threw themselves into a conspiracy against the life of their master. The difference between their spirit and that of Cicero is marked by the fact that in a plot which numbered, it was said, as many as eighty men of public note, Cicero himself was not included. The covert assassins dared not consult with men of true honour. When the deed was done, indeed, Cicero might fairly take part with its perpetrators in the name of the free state which in his sanguine view might still be restored. When, however, the liberators, as they called themselves, repaired to the provinces to strengthen their party against the Cæsarians, Cicero declined to undertake active service. He remained in Italy, and employed himself in guiding, as he thought, the conduct of the young Octavius, the nephew and heir of the dictator. This crafty dissembler promised well, and Cicero expected to be able to use him as a convenient opponent to Antonius. It must be confessed that the veteran statesman was himself playing a part, and dissembling with the youth whom he meant eventually to get rid of. It was a game on both sides, and Octavius

won it. He looked on with satisfaction while Cicero excited the passions of the citizens against Antonius in the series of orations to which he gave the name of Philippics, while he armed the consuls Hirtius and Pansa to overthrow him. The orator, now advanced in years, showed at this crisis all the vigour with which he had encountered Catiline twenty years earlier. To him the people entrusted the government of the city, and while all the forces of the republic were concentrated under various leaders on the Cisalpine, he might fancy himself for a moment the real controller of affairs. But after the deaths of Hirtius and Pansa in the battles before Mutina, and the discomfiture of the republicans under Decimus Brutus, Octavius, Antonius, and Lepidus formed a compact, and assumed to be a triumvirate, or a board of three special officers for the regulation of the commonwealth. Their arrival at Rome was followed by bloody proscriptions of their public and private enemies. Antonius demanded the head of Cicero, and Octavius yielded it. The orator fled, together with his brother, but he could not endure to abandon Italy, and after some weeks' delay, which seems to show that the pursuit was not keen, he was overtaken at the door of his Formian villa and his throat cut by the bravo Popilius. His head and hands were cut off and sent to Rome, where Antonius caused them to be affixed to the rostra, and Fulvia, the widow of Clodius and the wife of Antonius, pierced with her needle the tongue which had declaimed against both her husbands. Cicero perished at the close of the year 43, at the age of sixty-three. Octavius, in his later years, as the Emperor Augustus, could coolly say of the great statesman and patriot to whose murder he had consented, "He was a good citizen, who really loved his country." The saying was indeed well deserved, but it should have come from purer lips.

Cicero was indeed not only a good citizen, but a good man; he loved not his country only but mankind in general; he loved them not merely from a kindly nature, but from reflection and self-discipline. As a specimen of the highest culture of the ancient world both moral and intellectual he must ever stand pre-eminent. He was a wiser if not a more sincere patriot than Cato; his private virtues were subjected to a severer test than those of M. Aurelius. His intellectual superiority is sufficiently attested by the important place he attained, in the face of many disadvantages, in the conduct of public affairs. But a large portion of his multifarious writings still remains, and constitutes an enduring monument to his fame, which has been recognized through all ages. The great bulk of these works may be conveniently classed as (1) political, (2) philosophical, (3) personal. The first division comprises a collection of fifty-six speeches professing to have been delivered in the forum or the curia, though some of them certainly, as for instance that for Milo and the greater number of the Philippics, were written for publication but not actually delivered. The genuineness of that for Marcellus, and of the four which refer to the orator's return from exile, has been much questioned. Besides the speeches themselves, Cicero produced several treatises on the subject of oratory, which as part of the Roman training for public life may be regarded as political. Of these the principal are the *de Oratore*, the *Orator*, and the *Brutus*. The origin of the strictly technical treatises *de Inventione* and *Rhetoricorum* is involved in much perplexity. To this division belong still more strictly the important works *de Legibus* and *de Republica*, which contain valuable references to the events of early Roman history. To our second division belong the famous treatises on philosophy, from which we derive all our knowledge of the Greek systems which succeeded to the schools of Plato and Aristotle, and in which it became the fashion to affect an

interest at Rome. Of these the *Academica*, the *Tusculanae*, the *de Finibus*, and others which have been lost were devoted to speculative questions; the *de Divinatione* and *de Natura Deorum* refer more strictly to theological traditions; while the book *de Officiis* is an elaborate treatise on moral obligations. The smaller works, *de Senectute*, *de Amicitia*, *de Consolatione*, and probably the lost essay *de Gloria*, may also be ranged more or less definitely under the head of practical philosophy. The third division embraces Cicero's letters in two series, the one those to his friend Atticus, the other (*ad familiares*) to his correspondents generally. To these may be added a collection of letters addressed to his brother Quintus. These together give an account of the writer's life almost from day to day; they are the most valuable of his works for the historical information they afford us, as well as for the insight they give us into the character not of the writer only but of many of the leading personages of the day. In both these respects they stand unique among the remains of antiquity, and few men of historical note even in recent times have been so fully presented to us in their correspondence as Cicero, whose life acquires thereby its transcendent interest for all students of human nature. It may be added that the great philosopher and orator amused himself further with more than one ambitious flight in poetry. His verses on his consulship attracted some attention from his countrymen, and a specimen of them has come down to us. He made also a Latin translation of the astronomical poem of Aratus, and proposed at least, as has been above mentioned, to execute an epic on the invasion of Britain by Caesar.

The latest critical and complete edition of Cicero's works is that of J. Caspar Orellius, printed at Zurich (1826-1838). The text, accompanied by a full apparatus of various readings, is followed by a collection of the ancient scholiasts, an elaborate Onomasticon, and other valuable supplements. This edition is comprised in eight, but may be more conveniently bound in twelve large octavo volumes. (C. M.)

CICOGNARA, LEOPOLDO, COUNT (1767-1834), archaeologist and writer on art, was a native of Ferrara. At an early age he evinced strong predilections for the subjects on which he was to become so high an authority. Mathematical and physical science diverted him a while; but his bent was decided, and not even the notice of such men as Spallanzani and Scarpa could make a savant of him. A residence of some years at Rome, devoted to painting and the study of the antiquities and galleries of the Eternal City, was followed by a visit to Naples and Sicily, and by the publication, at Palermo, of his first work, a poem of no merit. The island explored, he betook himself to Florence, Milan, Bologna, and Venice, acquiring a complete and perfect knowledge of these and other cities from the point of view of an archaeologist and connoisseur. In 1795 he took up his abode at Modena, and was for twelve years engaged in politics, becoming a member of the legislative body, a councillor of state, and minister plenipotentiary of the Cisalpine Republic at Turin. Napoleon decorated him with the Iron Crown; and in 1808 he was made president of the Academy of the Fine Arts at Venice, a post in which he did good work for a number of years. In 1808 appeared his treatise *Del Bello Ragionamenti*, dedicated in glowing terms to Napoleon. This was followed (1813-1818) by his *magnum opus*, the *Storia della Scultura dal suo Risorgimento in Italia al Secolo di Napoleone*, in the composition of which he had been encouraged and advised by Giordano and Schlegel, while the great emperor to whom it was dedicated had assisted the publication pecuniarily,—an example which the Bourbons did not follow. This book, designed to complete the works of Winckelmann and D'Agincourt, was the result of many years of meditation and comparison; it is illustrated with 180 plates in outlines, and if imperfect, is yet of great value. In 1814, on the fall of Napoleon,

Cicognara was patronized by Francis I. of Austria, and published (1815–1820), under the auspices of that sovereign, his *Fabbriche più cospicue di Venezia*, two superb folios, containing some 150 plates. Charged by the Venetians with the presentation of their gifts to the Empress Caroline at Vienna, Cicognara added to the offering an illustrated catalogue of the objects it comprised; this book, *Omaggio delle Provincie Venete alla Maestà di Carolina Augusta*, printed for private circulation at the author's own expense, has since become of great value to the bibliophilist. Reduced to poverty by these splendid editorial speculations, Cicognara contrived to alienate the imperial favour by his political opinions. He left Venice for Rome; his library was sent to market; and in 1821 he published at Pisa a *catalogue raisonné*, rich in bibliographical lore, of this fine collection, the result of thirty years of loving labour, which in 1824 was purchased *en bloc* by Pope Leo XII., and added to the Vatican library. The other works of Cicognara are—the *Memorie Storiche de' Letterati ed Artisti Ferraresi*, 1811; the *Vite de' più insigni Pittori e Scultori Ferraresi*, MS.; the *Memorie spettanti alla Storia della Calcografia*, 1831; and a large number of dissertations on painting, sculpture, engraving, and other kindred subjects. (See Papoli, in No. 11 of the *Exile*, a print written and published by Italian refugees).

Cicognara's reputation is principally founded on his *Storia della Scultura*. This is a valuable book, but it is disfigured and weakened by the enthusiasm that led the author to sacrifice almost all the lights of modern sculpture to the reputation of his friend Canova, to whom the seventh part of the book is devoted. His work as president of the Academy at Venice was also excellent; to him are attributed the increase in number of the professors, the improvement in the courses of study, the institution of prizes, and the foundation of a gallery for the reception of Venetian pictures.

CID, THE, RODRIGO DIAZ DE BIVAR, the favourite hero of Spain, and the most prominent figure in her literature, has a name so obscured by myth and fable as scarcely to belong to history. So extravagant are the deeds ascribed to him, and so marvellous the attributes with which he has been clothed by the fond idolatry of his countrymen, that by some he has been classed with the Amadis and the Orlando whose exploits he emulated. The Jesuit Masdeu stoutly denies that he had any real existence, and this heresy has not wanted followers even in Spain. The truth of the matter, however, has been expressed by Cervantes, through the mouth of the Canon in *Don Quixote*: "There is no doubt there was such a man as the Cid, but much doubt whether he achieved what is attributed to him." The recent researches of Professor Dozy, of Leyden, have amply confirmed this opinion. There is a Cid of history and a Cid of romance, differing very materially in character, but each filling a large space in the annals of his country, and exerting a singular influence in the development of the national genius.

The Cid of history, though falling short of the poetical ideal which the patriotism of his countrymen has for 700 years cherished, is still the foremost man of the heroic period of Spain—the greatest warrior produced out of the long struggle between Christian and Moslem, and the perfect type of the Spanish Goth of the 12th century. Rodrigo Diaz, called de Bivar, from the place of his birth, better known by the title given him by the Arabs as the *Cid* (*El Seid*, the lord), and *El Campeador*, the champion *par excellence*, was of a noble family, one of whose members in a former generation had been elected judge of Castile. The date of his birth cannot be fixed with any certainty, but it was probably between 1030 and 1040. As Rodrigo Diaz de Bivar he is first mentioned in a charter of Fernando I. of the year 1064. The legends which speak of the Cid as

accompanying this monarch in his expeditions to France and Italy must be rejected as purely apocryphal. Fernando, a great and wise prince under whom the tide of Moslem conquest was first effectually stemmed, on his deathbed, in 1065, divided his territories among his five children. Castile was left to his eldest son Sancho, Leon to Alphonso, Galicia to Garcia, Zamora and Toro to his two daughters Urraca and Elvira. The extinction of the Western Caliphate and the dispersion of the once noble heritage of the Omniades into numerous petty independent states, had taken place some thirty years previously, so that Castilian and Moslem were once again upon equal terms, the country being almost equally divided between them. On both sides was civil war, urged as fiercely as that against the common enemy, in which the parties sought allies indiscriminately among Christians and Mahometans. No condition of affairs could be more favourable to the genius of the Cid. He rose to great distinction in the war between Sancho of Castile and Sancho of Navarre, in which he won his name of *Campeador*, by slaying the enemy's champion in single combat. In the quarrel between Sancho and his brother Alphonso, Rodrigo Diaz espoused the cause of the former, and it was he who suggested the perfidious stratagem by which Sancho eventually obtained the victory and possession of Leon. Sancho having been slain in 1072, while engaged in the siege of Zamora, Alphonso was taken from his prison and raised to the vacant throne. One of the most striking of the passages in the Cid's legendary history is that wherein he is represented as forcing the new king to swear that he had no part in his brother's death; but there was cause enough without this for Alphonso's animosity against the man who had helped to despoil him of his patrimony. For a time the Cid, already renowned throughout Spain for his prowess in war, was even advanced by the king's favour and entrusted with high commissions of state. In 1074 the Cid was wedded to Ximena, daughter of the count of Oviedo, and granddaughter, by the mother's side, of Alphonso V. The original deed of the marriage-contract is still extant. Some time afterwards the Cid was sent on an embassy to collect tribute from Motamid, the king of Seville, whom he found engaged in a war with Abdallah, the king of Granada. On Abdallah's side were many Castilian knights, among them Count Garcia Ordoñez, a prince of the blood, whom the Cid endeavoured vainly to persuade of the disloyalty of opposing their master's ally. In the battle which ensued under the walls of Seville, Abdallah and his auxiliaries were routed with great slaughter, the Cid returning to Burgos with many prisoners and a rich booty. There fresh proofs of his prowess only served to kindle against him the rancour of his enemies and the jealousy of the king. Garcia Ordoñez accused him to Alphonso of keeping back part of the tribute received from Seville, and the king took advantage of the Cid's absence on a raid against the Moors to banish him from Castile. Henceforth Rodrigo Diaz began to live that heroic-picaresque life which has made him famous, sometimes fighting under the Christian banner, sometimes under Moorish, but always for his own hand. At the head of a band of 300 free lances he offered his services first to the count of Barcelona; then, failing him, to Moctadir, the Arab king of Saragossa, of the race of the Beni Houd. Under Moctadir, and his successors Moutamin and Mostain, the Cid remained for nearly eight years, fighting their battles against Mahometan and Christian, when not engaged upon his own, and being admitted almost to a share of their royal authority. He made more than one attempt to be reconciled with Alphonso, but his overtures being rejected, he turned his arms against the enemies of the Beni Houd, extending their dominions at the expense of the

Christian states of Aragon and Barcelona, and harrying even the border lands of Castile. Among the enterprizes of the Cid the most famous was that against Valencia, then the richest and most flourishing city of the Peninsula, and an object of cupidity to both Christian and Moslem. The Cid appeared before the place at the head of an army of 7000 men, for the greater part Mahometans. In vain did the Valencians implore succour from the emir of Cordova, and from their co-religionists in other parts of the Peninsula. In defiance of an army which marched to the relief of the beleaguered city under Yussuf the Almoravide, the Cid took Valencia after a siege of nine months, on the 15th of June 1094—the richest prize which up to that time had been recovered from the Moors. The conditions of the surrender were all violated—the *cadi* Ibn Djahhaff burnt alive, a vast number of the citizens who had escaped death by famine slaughtered, and the possessions divided among the Campeador's companions. In other respects the Cid appears to have used his victory mildly, ruling his kingdom, which now embraced nearly the whole of Valencia and Murcia, for four years with vigour and justice. At length the Almoravides, whom he had several times beaten, marched against him in great force, inflicting a crushing defeat at Cuença upon the Cid's army, under his favourite lieutenant, Alvar Fañez. The blow was a fatal one to the aged and war-worn Campeador, who died of anger and grief in July 1099. His widow maintained Valencia for three years longer against the Moors, but was at last compelled to evacuate the city, taking with her the body of the Cid to be buried in the monastery of San Pedro at Cardeña, in the neighbourhood of Burgos. Here, in the centre of a small chapel, surrounded by his chief companions in arms, by Alvar Fañez Minaya, Pero Bermudez, Martin Antolinez, and Pelaez the Asturian, rest, after frequent disturbances from friend and foe, the bones of the mighty warrior, the truest of Spanish heroes, the embodiment of all the national virtues and most of the national vices. Philip II. tried to get him canonized, but Rome objected, and not without reason. Whatever were his qualities as a fighter, the Cid was but indifferent material out of which to make a saint,—a man who battled against Christian and against Moslem with equal zeal, who burnt churches and mosques with equal zest, who ravaged, plundered, and slew as much for a livelihood as for any patriotic or religious purpose, and was in truth almost as much of a Mussulman as a Christian in his habits and his character. His true place in history is that of the greatest of the *guerrilleros*—the perfect type of that sort of warrior in which, from the days of Sertorius to those of El Empecinado, the soil of Spain has been most productive.

The Cid of romance, the Cid of a thousand battles, legends, and dramas, the Cid as apotheosized in literature, the Cid invoked by good Spaniards in every national crisis, whose name is a perpetual and ever-present inspiration to Spanish patriotism, is a very different character from the historical Rodrigo Diaz—the freebooter, the rebel, the consorter with the infidels and the enemies of Spain. He is the Perfect One, the Born in a Happy Hour, “My Cid,” the invincible, the magnanimous, the all-powerful. He is the type of knightly virtue, the mirror of patriotic duty, the flower of all Christian grace. He is Roland and Bayard in one. In the popular literature of Spain he holds a place such as has no parallel in other countries. From an almost contemporary period he has been the subject of song; and he who was chanted by wandering minstrels in the 12th century has survived to be hymned in revolutionary odes of the 19th. In a barbarous Latin poem, written in celebration of the conquest of Almeria by Alphonso VII. in the year 1147, we have the bard testifying

to the supereminence of the Cid among his country's heroes :—

“Ipse Rodericus *Mio* Cid semper vocatus,
De quo catur quod ab hostibus haud superatus,
Qui domuit Mauros, comites domuit quoque nostros.”

Within a hundred years of his death the Cid had become the centre of a whole system of myths. The *Poema del Cid*, written in the latter half of the 12th century, has scarcely any trace of a historical character. Already the Cid had reached his apotheosis, and Castilian loyalty could not consent to degrade him when banished by his sovereign :—

“Dios, que buen vassalo si oviesc buen señor!”

cry the weeping citizens of Burgos, as they speed the exile on his way.

The Poem of the Cid is but a fragment of 3744 lines, written in a barbarous style, in rugged assonant rhymes, and a rude Alexandrine measure, but it glows with the pure fire of poetry, and is full of a noble simplicity and a true epical grandeur, invaluable as a living picture of the age. The ballads relating to the Cid, of which nearly two hundred are extant, are greatly inferior in merit, though some of them are not unworthy to be ranked with the best in this kind. Duran believes the greater part of them to have been written in the 16th century. A few betray, not more by the antiquity of their language than by their natural and simple tone, traces of an earlier age and a freer national life. They all take great liberties with history, thus belying the opinion of Sancho Panza that “the ballads are too old to tell lies.” Such of them as are not genuine relics of the 12th century are either poetical versions of the leading episodes in the hero's life as contained in the *Chronicle*, that *Chronicle* itself having been doubtless composed out of still earlier legends as sung by the wandering *jugarés*, or pure inventions of a later time, owing their inspiration to the romances of chivalry. In these last the ballad-mongers, not to let their native hero be outdone by the Amadis, the Esplandians, and the Felix-martes, engage him in the most extravagant adventures—making war upon the king of France and upon the emperor, receiving embassies from the Soldan of Persia, bearding the Pope at Rome, and performing other feats not mentioned even in the Poem or the Chronicle. The last and the worst of the Cid ballads are those which betray by their frigid conceits and feeble mimicry of the antique the false taste and essentially unheroic spirit of the age of Philip II. As for the innumerable other poems, dramas, and tales which have been founded on the legend of the Cid, from the days of Guillen de Castro and Diamante to those of Quintana and Trucba, they serve merely to prove the abiding popularity of the national hero in his native land.

The chief sources from which the story of the Cid is to be gathered are, first, the Latin chronicle discovered by Risco in the convent of San Isidro at Leon, proved by internal evidence to have been written before 1258; the *Cronica General*, composed by Alphonso X. in the second half of the 13th century, partly (so far as relates to the Cid) from the above, partly from contemporary Arabic histories, and partly from tradition; the *Cronica del Cid*, first published in 1512, by Juan de Velorado, abbot of the monastery of San Pedro at Cardeña, which is a compilation from the last, interlarded with new fictions due to the piety of the compiler; lastly, various Arabic manuscripts, some of contemporary date, which are examined and their claims weighed in the second volume of Professor Dozy's *Historie de la littérature de l'Espagne au moyen âge*. Huber, Muller, and Ferdinand Wolf are among the leading authorities in the history and literature of the Cid. M. Damas Hinard has published the poem, with a literal French translation and notes, and John Hookham Frere has rendered it into English with extraordinary spirit and fidelity. The largest collection of the Cid ballads is that of Duran, in the *Romancero General*, in two volumes, forming part of Rivadeneyra's *Biblioteca de Autores Españoles*. (H. E. W.)

CIDER, an alcoholic beverage obtained by the fermentation of the juice of apples. The manufacture is chiefly carried on by the cultivators of the fruit, and it has been conducted from very remote times in Hereford, Worcester, Gloucester, Somerset, and Devonshire in England, and in Normandy in France. Cider is also largely prepared and consumed in Upper Austria, Wurtemberg, in the districts of the Maine and the Moselle, and in Holland; and it is besides a common beverage in the New England and Western States of America. In the south-west of England the most esteemed varieties of apple cultivated for cider-making are the Royal Wilding, the Foxwhelp, White Normandy Beech, Yellow Styre, Handsome Mandy, and Skyrme's Kernel. For a superior quality of cider the large well matured apples of several varieties are selected, and are ground up to a fine pulp either in an old-fashioned cider mill, or in one of several newer machines which have been introduced for pulping the fruit. The old form of mill consists of a circular trough around which a huge heavy stone wheel or runner, weighing about a ton, is drawn by a horse. Into the trough a charge of apples, to the amount of from 8 to 10 bushels, is thrown, and the mill is kept in motion till the whole mass is reduced to a fine uniform pulp, which is technically called "the cheese." The old-fashioned mills are now generally superseded by modern inventions, of which Coleman's cider press may be taken as the type. It consists of two pairs of rollers mounted in a strong wooden frame. The first and upper pair are of hard wood, studded with iron teeth or knives, set immediately under a hopper into which the fruit is fed. In passing between the first pair the fruit is sliced into small pieces which fall between the second pair of rollers, placed immediately below. These consist of heavy cylinders of stone set quite close so that the apposing surfaces press against each other, and the sliced apples in passing between them are bruised to a fine pulp which is received into a trough placed directly under. The pulp or cheese is, or ought to be, laid aside for at least a night to allow fermentation to set in before the juice is expressed. By this means the aromatic oil contained in the seeds is extracted, communicating its aroma to the mass, and a richer, fuller-flavoured beverage is the result. The cheese is placed in hair-cloths in a strong framed box for expressing the juice, an operation which must be gently and carefully performed, so that the liquid may be obtained as pure and clear as possible. The juice ought to have a specific gravity of from 1.07 to 1.08, and should contain 10 or 11 per cent. of sugar and 0.6 to 0.7 per cent. of malic acid. The liquor is strained and placed for fermenting either in large vats or in separate casks. In the fermentation which ensues an abundant sediment is thrown to the bottom and a scum rises to the surface. In a week or ten days this action should leave the liquid clear and bright if the fermentation has continued steady and moderate. The liquid is then racked off into casks, as free as possible from scum and sediment, and excluded from atmospheric influence to stop the further action of the ferment. If in the early part of the following spring it is found to be still clear, nothing further is required except to cask it up for the market; but should it have become thick and ropy it must be "fined" either by means of isinglass or with stewed and mashed apples. It is frequently found necessary, in order effectually to stop fermentation, to expose the liquor to the influence of sulphurous acid gas, which is done by burning a sulphur tipped stick inside a cask half filled with cider, and shaking the cask so as to make the liquor absorb the acid gas. Such "matched" cider is readily detected by connoisseurs. The artificial colouring of cider, when practised, is done either with burnt sugar, the juice of red beet, logwood, or cochineal; and in Germany a flavour is sometimes communicated to the beverage

with elder flowers, cinnamon, cloves, or other aromatics. The following analysis of a pint of common cider such as is supplied to agricultural labourers in Somersetshire is by Dr Voelcker:—

Water	8292.41 gra.
Alcohol.....	367.69
Grape Sugar.....	31.67
Gum and extractive matter	45.05
Albuminous compounds.....	1.94
Malic Acid	44.86
Ash	18.38

8802.00 grs

Cider is very prone to undergo acetous fermentation, and develop a rough, sharp, vinegary taste; and in that condition its consumption readily causes diarrhoea and colic. Roughness may be much reduced by treatment with various compounds prepared for the purpose which contain lime, or by the addition of a quantity of hops boiled with treacle or honey to the acetified cider. When sound it is a wholesome, agreeable, and refreshing stimulant beverage. In Germany a spirit, apple brandy, is distilled from cider.

CIEÑFUEGOS, NICASIO ALVAREZ DE (1762–1809), poet and publicist, was born at Madrid. He studied with distinction at Salamanca, where he sat at the feet of the poet Melendez Valdez. The year 1778 saw the first of his poems published, and the attention of his countrymen was immediately attracted. He was appointed editor of the Government organs, the *Gaceta* and *Mercurio*, and an article on Napoleon published in the former drew down on him the heavy hand of Murat. Cienfuegos was condemned to death; he refused submission, and would assuredly have been executed but for the prayers of his friends. At their instance the sentence was commuted into one of deportation into France. Worn out with grief and fatigue, he died at Orthez in the following year. His verses are imitated from those of Melendez Valdez; they are by no means deficient in science or passion, but they are too often disfigured by a spurious sentimentality and by an affectation of the flimsy philosophy of the age. He was blamed for an unsparing use at once of archaisms and of novelties, which some regarded with approval, but others denounced him as a traitor to the glorious traditions of Castilian art, and as bent on Frenchifying the noble Castilian idiom. His plays—*Pitaco*, *Zoraida*, *La Condesa de Castilla*, and *Idomeno*, four tragedies on the pseudo-classic French model, and *Las Hermanas Generosas*, a comedy—have been long forgotten both in the closet and on the stage. See Tiecknor, *History of Spanish Literature*, vol. iii.; and Cienfuegos, *Obras Poeticas*, 2 vols., Madrid, 1816.

CIGAR, a form in which tobacco is prepared for smoking without the use of a pipe. Cigars consist of certain portions of small and broken leaf tobacco rolled together in the form of a short stick or rod tapering to a point at one end called the end or twist, and finely wrapped round with one or two wrappings of whole leaf tobacco. The manufacture of cigars is conducted by hand-labour, and the various operations are performed with great dexterity. The selected leaves to be used for wrapping are first damped and stripped or freed from the midrib, by which each leaf is torn into two halves. These are smoothed out and pressed to remove any creases, and with a sharp knife the workman cuts each into the proper shape to form a wrapper. On each wrapper so prepared a sufficient quantity of small and broken leaf is placed, and the whole is then wrapped up in the form of a cigar. An external wrapper of fine uniform leaf is added and secured in a peculiar kind of knot at the smaller end. The thick end is trimmed by placing the cigar in a gage and cutting it to a definite size. After finishing the cigars are dried on trays either by exposure to

the sun or in artificial heat, and when thoroughly dry they are packed in boxes for sale. *Cheroots* differ only in form from ordinary cigars, sloping gradually from the thick to the thin end, which instead of finishing in a point, is cut and trimmed the same as the thick end. *Cigarettes* are small cigars, sometimes consisting of fine cut tobacco wrapped up in thin paper or inserted in straw tubes. Cigars are sold under an immense variety of names, derived either from the country of their manufacture, from the kind of tobacco used, or from the fancy of the manufacturer. The finest cigars are obtained from Havana in Cuba, and in them the thick ends are left untrimmed by the knife; but although this is characteristic it is obviously no test of genuineness. *Cheroots* come principally from Manilla in the Philippine Islands. See **TOBACCO**.

CIGNANI, CARLO (1628–1719), was born at Bologna, where he studied under Battista Cairo, and afterwards under Albani. Though an intimate friend of the latter, and his most renowned disciple, Cignani was yet strongly and deeply influenced by the genius of Correggio, as a comparison of his drawing and of his manner of treating light and shadow with that of the painter of Parma will prove. His greatest work, moreover, the Assumption round the cupola of the church of the Madonna della Fuoca at Forlì, which occupied him some twenty years, and is in some respects one of the grandest and most remarkable works of art of the 17th century, is obviously inspired from the more renowned fresco of Antonio Leti in the cupola of the cathedral of Parma. Cignani had some of the defects of his masters; his elaborate finish, his audacious artificiality in the use of colour and in composition, mark the disciple of Albani; but he imparted to his work a more intellectual character than either of his models, and is not without other remarkable merits of his own. In private character Cignani was eminently amiable, unassuming, and generous. His success, however, made him many enemies; and the envy of some of these is said to have impelled them to deface certain of his works. He accepted none of the honours offered him by the duke of Parma and other princes, but lived and died an artist. On his removal to Forlì, where he died, the school he had founded at Bologna was fain in some sort to follow its master. His most famous pictures, in addition to the Assumption already cited, are—the Entry of Paul III. into Bologna; the François I. Touching for King's Evil; a Power of Love, painted under a fine ceiling by Agostino Carracci, on the walls of a room in the ducal palace at Parma; an Adam and Eve; a Temptation of Joseph, in the Florentine Palazzo Arnoldi; and a Sampson, in the Bolognese Palazzo Zambeccari.

CIGOLI, or CIVOLI, LUIGI CARDI DA (1559–1613), painter, architect, and poet, was born at Cigoli in Tuscany. Educated under Allori and Santo di Titi, he formed a peculiar style by the study at Florence of Michelangelo, Correggio, Andrea dal Sarto, and Pontormo. Assimilating more of the second of these masters than of all the others, he laboured for some years with success; but the attacks of his enemies, and intense application to the production of a wax model of certain anatomical preparations, induced an alienation of mind which affected him for three years. At the end of this period, he visited Lombardy, whence he returned to Florence. There he painted an *Ecce Homo*, in competition with Passignani and Caravaggio, which gained the prize. This work was afterwards taken by Bonaparte to the Louvre, and was restored to Florence in 1815. His other pictures of importance are—a St Peter Healing the Lame Man, in the church of St Peter's at Rome; a Conversion of St Paul, in that of San Paolo fuori le Mura, and a Story of Psyche, in fresco, at the Villa Borghese, in the same city; a Martyrdom of Stephen, which earned him

the name of the Florentine Correggio, a *Veus* and *Satyr*, and a *Sacrifice of Isaac*, at Florence; and a *Stigmata of St Francis*, at Foligno. Cigoli, who was made a knight of Malta at the request of Pope Paul III., was a good and solid draughtsman and the possessor of a rich and harmonious palette. He died, it is said, of grief at the failure of his last fresco (in the Roman church of Santa Maria Maggiore), which is rendered ridiculous by an abuse of perspective.

CILICIA, one of the most important provinces in the ancient division of Asia Minor, partly represented by the modern province of Adana. It comprised a large part of the southern coast of that country, extending from Pamphylia on the W. to Mount Amanus and the frontiers of Syria on the E. Throughout this extent it was bounded by the central ridge of Mount Taurus on the N. and by the Mediterranean on the S., so that its form was long and narrow, having a length in a direct line of nearly 270 English miles, while its breadth hardly anywhere exceeds 68 miles. It is divided by nature into two portions of a very different character;—the westernmost, known in ancient times as Cilicia Trachea or Tracheotis (the modern *Itschi Ili*), the Rugged Cilicia, a well-deserved epithet, as almost the whole region is occupied by a rugged mountain tract, formed by the branches and offshoots of Mount Taurus, which descend for the most part quite to the sea, while the interior is furrowed by deep and narrow valleys, leaving but scanty spaces fit for cultivation; the easternmost, on the contrary, called Cilicia Pedias, or “of the Plains,” presenting a broad expanse of level alluvial plains round which the lofty chain of Mount Taurus sweeps in a semicircle, forming a great mountain barrier that encloses it like a wall on the north and east, and separates it from the extensive upland plains of Lycaonia and Cappadocia.

Towards the west the limit between Cilicia and Pamphylia was an arbitrary one; the first place that is assigned by Strabo to Cilicia being Coracesium, a remarkable fortress on a projecting rocky headland, now called Alaja. The whole of this rugged mountain district indeed abounds in such projecting headlands, with small sheltered coves or harbours beneath them,—a character that has peculiarly fitted it, both in ancient and in modern times, for affording shelter to pirates. At the same time the difficulty of communication with the interior has prevented any of the towns on the coast from rising into important centres of trade. Notwithstanding these disadvantages there were in ancient times a considerable number of towns surrounding the coasts of Cilicia Trachea; among which may be mentioned (proceeding from W. to E.) Selinus, afterwards called Trajanopolis; Anemurium, near the promontory of the same name, which is the southernmost point of Asia Minor; Celenderis, still called Kelenderi, and used as a place of passage to the Island of Cyprus, though now a poor decayed village; and Seleucia, termed for distinction's sake Seleucia ad Calycadnum, from its position at the mouth of the river of that name. The Calycadnus, now known as the *Gök Su*, or “Blue River,” is indeed the only river of any importance in Cilicia Trachea, which it traverses nearly through its whole length, rising but a short distance from the sea, and flowing through a very winding valley, but with a general direction from W. to E. The only towns in the interior of this western part of Cilicia—Mout, which occupies the site of Claudopolis, and Ermenek (Germaniopolis)—are situated in the valley of the Calycadnus, but they are places of little importance. The whole of this mountain tract is still covered with extensive forests, which in ancient times supplied timber for the navies of the Egyptian and Syrian kings, but are now almost entirely neglected.

The small river *Lamus* still called *Lamas Su* was con-

sidered by ancient geographers as constituting the limit between the two different provinces of Cilicia. From that point the mountains begin to recede from the coast, and leave a narrow strip of alluvial plain between them and the sea, which, beyond Soli to the east, opens out into the broad level expanso that gave name to Cilicia Pedias. The whole of this extensive plain, spreading out in some parts to more than 30 miles in width, is composed of alluvial deposits brought down by the rivers that intersect it. It has consequently a soil of great natural fertility, and would be capable of the richest cultivation; but it is for the most part a desolate uncultivated tract, in which the towns of Tarsus and Adana, with their surrounding gardens and fruit-trees, appear like oases in the midst of a desert. The surrounding plains are the abode in winter of numerous hordes of Turcomans and Kurds, who wander over them freely with their flocks and herds; while in summer they are rendered pestilential by the noxious miasmata produced by the marshes formed by the rivers that flow through them, so that at this season they are almost wholly uninhabited.

The plains of eastern Cilicia are traversed by three considerable rivers. Of these the Cydnus, which flows by Tarsus, though much the most celebrated in ancient times, is the least considerable. It is formed by the junction of three streams, all of which rise on the southern slope of the Bulgharlagh, as the portion of Mount Taurus immediately north of Tarsus is called; and it has consequently but a short course from thence to the sea. But it is a deep and rapid stream, and was celebrated in antiquity for the coolness and clearness of its waters, a bath in which nearly cost Alexander the Great his life. The other two rivers, the Sarus and Pyramus, now known as the Sihun and Jihun, are much more important. Both of these take their rise in the upland plains of Cappadocia, beyond the range of Mount Taurus, through which they force their way to the Cilician plains below. On arriving in these they spread out into stagnant pools and marshes, through which the main streams are continually changing their courses, and cutting out for themselves new channels. These changes have caused much confusion in reconciling the accounts given by ancient writers with the present geography of the country. It appears certain that in ancient times the Sarus joined the Pyramus near its mouth, and both together fell into the sea immediately to the west of the small rocky headland called Karatasch Burun, near the site of the ancient city of Mallus; but at the present day the Sihun holds a separate course from Adana towards the south-west, flowing into the sea within a few miles of the mouth of the Cydnus, while the Jihun, as it approaches the sea, takes a sudden turn to the east, and flows into the Gulf of Scanderoon, between the site of Mallus and that of the ancient Age, now known as Aias.

Imperfectly as the plains of this part of Cilicia are cultivated, they produce cotton, wheat, barley, tobacco, and sesame in sufficient quantities to show of what they would be capable if properly drained and tilled; while the gardens around the towns of Tarsus and Adana are planted with palms, orange-trees, figs, and other fruit trees, which flourish with the utmost luxuriance. The climate in summer is intensely hot; and the plains at that season are burnt up and parched; but the abundant means of irrigation at hand, if properly utilized, would effectually remedy that disadvantage. These extensive plains are frequented by numbers of gazelles and jerboas, as well as bustards, francolins, and other game. Buffaloes also abound in the marshy tracts near the sea. In the ranges of Mount Taurus leopards, for which the province was noted in the time of Cicero, are still found not unfrequently.

Besides Tarsus and Adana, which retain their ancient names as well as sites, there were in ancient times several other important cities in the eastern portion of Cilicia. Among these Soli (afterwards called Pompeiopolis, from its having been re-peopled and rebuilt by Pompey the Great) was situated at the western extremity of the great plain, a few miles west of Mersina, the modern port of Tarsus; while Mallus occupied the promontory now called Karatasch Burun, at its eastern extremity. In the interior were Mopsuestia (now Missis) on the River Pyramus, and Anazarbus (still called Ain Zarba) higher up the valley of the same river, which, under the Roman and Byzantine empires, became one of the most flourishing cities of Cilicia. In modern times Adana, which is the capital of the pashalic or vilayet that comprises all Cilicia, is much the most important town in the province, and is estimated to contain 18,000 inhabitants, while Tarsus does not possess more than 7000 or 8000.

Mersina, the port of Tarsus, though still but a small place, is gradually becoming the seat of a considerable trade, being the only outlet for the productions of the interior.

Cilicia is bounded on the east (as already stated) by Mount Amanus, one of the most considerable of the branches or offshoots of Mount Taurus. But the range to which this name was given by ancient geographers is in fact a double one, which forks into two branches about midway between Marasch and the sea, and sends down two arms,—the one in a south-west direction, ending in the Cilician plain before reaching the sea; the other running nearly due south till it curves round the Gulf of Scanderoon, and ends in the lofty mountain promontory of Ras el Khanzin, the Rossicus Scopulus of Ptolemy. Between these two ranges lies the deep bay or inlet called in ancient times the Gulf of Issus, and now known as the Gulf of Scanderoon, from the seaport of that name; this is above 50 miles long and about 20 miles wide at its entrance. On its shores were situated in ancient times the towns of Aegæ (now Aias) on the western side, and Issus, Myriandrus, and Rhosus on the eastern; but after the foundation of Alexandria on the same side of the gulf, these last towns sank into comparative insignificance. Alexandria still survives under the name of Alexandretta, or Iskenderun (commonly corrupted into Scanderoon) as it is called by the Turks, and is a place of considerable trade.

The southern branch of Mount Amanus unquestionably constitutes the natural limit of Cilicia, and hence Strabo correctly assigns all the towns north of the promontory of Rhosus to Cilicia, and those on the other side of it to Pieria in Syria. But for political purposes the limit was fixed at a point some miles north of Alexandria, where there was a fortified pass called the Syrian Gates. The name of Pyke Syria or Syrian Gates was also given, however, to the mountain pass across the range of Mount Amanus, now known as the Pass of Beilan, which has in all ages formed the direct route from Asia Minor into Syria. It was to its command of these passes, as well as that called the Cilician Gates on the north, leading directly across the chain of Mount Taurus, that Cilicia owed much of its importance in a military and political point of view.

History.—Though the boundaries of Cilicia, as above defined, were generally recognized in ancient times, the people of that name appears to have been in early days much more widely spread, and occupied a considerable extent of country north of Mount Taurus, as well as in the mountain regions extending towards Armenia. Thus Herodotus extends the name of Cilicia to the Euphrates, and must have comprised a large portion of Cappadocia under that appellation. There can be no doubt that the Cilicians, as well as the Cappadocians, were of Semitic or Aramaic descent, and belonged to the same stock as the

Syrians, from whom, however, they were from a very early period politically separate. Cilicia appears as an independent kingdom under a monarch named Syennesis, in the time of Alyattes, king of Lydia, 610 B.C. (Herod., i. 74), and even after it passed under the Persian empire it continued to be governed by its own kings, all of whom appear to have borne the name, or rather appellation, of Syennesis. From its position Cilicia attracted much attention during the expedition of the younger Cyrus (401 B.C.), as well as in that of Alexander, whose first great victory over the Persian king was fought at Issus, in the narrow pass between Mount Amanus and the sea (333 B.C.)

Cilicia now passed under the Macedonian rule, and was subject to the Seleucidan kings of Syria. But owing to the feeble and unsettled character of the government under the later monarchs of that dynasty, the western portion of the country, or Cilicia Trachea, became the stronghold of numerous pirates, who carried their depredations to such an extent as to compel the Romans to wage regular war upon them. It was not till 66 B.C. that they were finally subdued by Pompey, and Cilicia was regularly constituted as a Roman province, which, however, comprised, in addition to Cilicia properly so called, Pamphylia, Pisidia, Isauria, Lycaonia, and a large part of Phrygia. This was the extent of the province when it was governed by Cicero as proconsul (51–50 B.C.), who obtained some successes against the mountain tribes of Mount Amanus, of which he was immoderately proud.

Under the Roman empire Cilicia was again reduced to its natural limits, but did not receive its final constitution as a province till the time of Vespasian. It retained its condition as such under the Roman and Byzantine empires till it fell, with the rest of Asia Minor, under the Seljukian-Turks in the 11th century. After the break-up of the Turkish monarchy Cilicia was seized by the Armenians, who from the mountain districts of Mount Amanus and Taurus gradually made themselves masters of the whole country, of which they retained possession, notwithstanding frequent struggles with the Lusignans—the lords of the neighbouring island of Cyprus—till both were expelled by the Ottoman Turks in the 15th century. From that period Cilicia has continued to form part of the Turkish empire, with the exception of the brief interval from 1833 to 1840, during which it was annexed to his dominions by Mehemet Ali, viceroy of Egypt; but after the defeat of that ruler by the allied powers he was compelled to evacuate Cilicia, which was reunited as before with the Ottoman empire.

The ancient geography of Cilicia is well described by Strabo (bk. xiv. ch. 5). Its coasts were first visited and were described in detail by Captain Beaufort in his *Karamania*, 8vo, Lond., 1818. A more complete examination of the whole country was made by M. Langlois in 1852–58 (*Voyage dans la Cilicie et dans les Montagnes du Taurus*, 8vo, Paris, 1861). (E. H. B.)

CIMABUE, GIOVANNI (1240 to about 1302), painter, was born in Florence of a creditable family, which seems to have borne the name of Gualtieri, as well as that of Cimabue (Bullhead). He took to the arts of design by natural inclination, and sought the society of men of learning and accomplishment. Vasari, the historian of Italian painting, zealous for his own native state of Florence, has left us the generally current account of Cimabue, which later researches have to a great extent invalidated. We cannot now accept his assertion that art, extinct in Italy, was revived solely by Cimabue, after he had received some training from Grecian artists invited by the Florentine Government to paint the chapel of the Gondi in the church of S. Maria Novella; for native Italian art was not then a nullity, and this church was only begun when Cimabue was already forty years old. Even Lanzi's qualifying statement that Grecian artists, although they did not paint the chapel of the Gondi, did execute rude decorations in a chapel below

the existing church, and may thus have inspirited Cimabue, makes little difference in the main facts. What we find as the general upshot is that some Italian painters preceded Cimabue—particularly Guido of Siena and Giunta of Pisa; that he worked on much the same principle as they, and to a like result; but that he was nevertheless the most advanced master of his time, and, by his own works, and the training which he imparted to his mighty pupil Giotto, he left the art far more formed and more capable of growth than he found it. The undoubted admiration of his contemporaries would alone demonstrate the conspicuous position which he held, and deserved to hold. For the chapel of the Rucellai in S. Maria Novella he painted in tempera a colossal Madonna and Child with Angels, the largest altarpiece produced up to that date; before its removal from the studio it was visited with admiration by Charles of Anjou, with a host of eminent men and gentle ladies, and it was carried to the church in a festive procession of the people and trumpeters. Cimabue was at this time living in the Borgo Allegri, then outside the walls of Florence; the legend that the name Allegri (Joyous) was bestowed on the locality in consequence of this striking popular display is more attractive than accurate, for the name existed already. Of this celebrated picture, one of the great landmarks of modern and sacred art, some details may be here given, which we condense from the *History of Painting in Italy* by Messrs Crowe and Cavalcaselle. "The Virgin in a red tunic and blue mantle, with her feet resting on an open-worked stool, is sitting on a chair hung with a white drapery flowered in gold and blue, and carried by six angels kneeling in threes above each other. A delicately engraved nimbus surrounds her head, and that of the infant Saviour on her lap, who is dressed in a white tunic, and purple mantle shot with gold. A dark-coloured frame surrounds the gabled square of the picture, delicately traced with an ornament interrupted at intervals by thirty medallions on gold ground, each of which contains the half-figure of a saint. In the face of the Madonna is a soft and melancholy expression; in the form of the infant, a certain freshness, animation, and natural proportion; in the group, affection—but too rare at this period. There is sentiment in the attitudes of the angels, energetic mien in some prophets, comparative clearness and soft harmony in the colours. A certain loss of balance is caused by the overweight of the head in the Virgin as compared with the slowness of her frame. The features are the old ones of the 13th century; only softened, as regards the expression of the eye, by an exaggeration of elliptical form in the iris, and closeness of the curves of the lids. In the angels, the absence of all true notions of composition may be considered striking; yet their movements are more natural and pleasing than hitherto. One indeed, to the spectator's right of the Virgin, combines more tender reverence in its glance than any that had yet been produced. Cimabue gave to the flesh-tints a clear and carefully fused colour, and imparted to the forms some of the rotundity which they had lost. With him vanished the sharp contrasts of hard lights, half-tones, and shadows." In a general way, it may be said that Cimabue showed himself forcible in his paintings, as especially in heads of aged or strongly characterized men; and, if the then existing development of art had allowed of this, he might have had it in him to express the beautiful as well. He, according to Vasari, was the first painter who wrote words upon his paintings,—as, for instance, round the head of Christ in a picture of the Crucifixion, the words addressed to Mary, *Mulier ecce filius tuus*.

Other paintings still extant by this master are the following:—In the Academy of Arts in Florence, a Madonna and Child, with eight angels, and some prophets in niches,—better than the Rucellai picture in composition and study

of nature, but more archaic in type, and the colour now spoiled (this work was painted for the Badia of S. Trinita, Florence); in the National Gallery, London, a Madonna and Child with Angels, which came from the Ugo Baldi collection, and had probably once been in the church of S. Croce, Florence; in the Louvre, a Madonna and Child, with twenty-six medallions in the frame, originally in the church of S. Francesco, Pisa. In the lower church of the Basilica of S. Francesco at Assisi, Cimabue, succeeding Giunta da Pisa, probably adorned the south transept,—painting a colossal Virgin and Child between four Angels, above the altar of the Conception, and a large figure of St Francis. In the upper church, north transept, he has the Saviour Enthroned and some Angels; and, on the central ceiling of the transept, the Four Evangelists with Angels. Many other works in both the lower and the upper church have been ascribed to Cimabue, but with very scanty evidence; even the above-named can be assigned to him only as matter of probability. Numerous others which he indisputably did paint have perished,—for instance, a series (earlier in date than the Rucellai picture) in the Carmine church at Padua, which were destroyed by a fire.

From Assisi Cimabue returned to Florence. In the closing years of his life he was appointed capomaestro of the mosaics of the Cathedral of Pisa, and was afterwards, hardly a year before his death, joined with Arnolfo di Lapo as architect for the Cathedral of Florence. In Pisa he executed a Majesty in the apse,—Christ in glory between the Virgin and John the Evangelist, a mosaic, now much damaged, which stamps him as the leading artist of his time in that material. This was probably the last work that he produced.

The debt which art owes to Cimabue is not limited to his own performances. He was the master of Giotto, whom he found a shepherd boy of ten, in the pastures of Vespignauo, drawing with a coal on a slate the figure of a lamb. Cimabue took him to Florence, and instructed him in the art; and after his death Giotto occupied a house which had belonged to his master in the Via del Cocomero. Another painter with whom Cimabue is said to have been intimate was Gaddo Gaddi.

It had always been supposed that the bodily semblance of Cimabue is preserved to us in a portrait-figure by Simon Memmi painted in the Cappella degli Spagnuoli, in S. Maria Novella,—a thin hooded face in profile, with small beard, reddish and pointed. This is now extremely dubious. Simone Martini of Siena (commonly called Memmi) was born in 1283, and would therefore have been about nineteen years of age when Cimabue died; it is not certain that he painted the work in question, or that the figure represents Cimabue. The Florentine master is spoken of by a nearly contemporary commentator on Dante (the so-called Anonimo, who wrote about 1334) as *arrogante e disdegnoso*; so “arrogant and passionate” that, if any one, or if he himself, found a fault in any work of his, however cherished till then, he would abandon it in disgust. This, however, to a modern mind, looks more like an aspiring and fastidious desire for perfection than any such form of “arrogance and passion” as blemishes a man’s character. Giovanni Cimabue was buried in the cathedral of Florence, S. Maria del Fiore, with an epitaph written by one of the Nini:—

“Credidit ut Cimabue picture castra tenere
Sic tenuit vivens; nunc tenet astra poli.

Here we recognize distinctly the suggestion of the first clause in the famous triplet of Dante:

“Credette Cimabue nella pittura
Tener lo campo; ed ora ha Giotto il grido,
Sì che la fama di colui s’oscura.” (W. M. R.)

CIMAROSA, DOMENICO (1749–1801), an Italian musical composer, was born at Aversa, in the kingdom of Naples. His parents were poor but anxious to give their son a good education; and after removing to Naples they sent him to a free school connected with one of the monasteries of that city. The organist of the monastery, Padre Polcano, was struck with the boy’s intellect, and voluntarily instructed him in the elements of music, as also in the ancient and modern literature of his country. To the influence of the same worthy monk Cimarosa owed a free scholarship at the musical institute of Santa Maria di Loreto, where he remained for eleven years, studying chiefly the great masters of the old Italian school. Piccini, Sacchini, and other musicians of repute are mentioned amongst his teachers. At the age of twenty-three Cimarosa entered the lists as a composer with a comic opera called *Le Stravaganze del Conte*, first performed at the theatre dei Fiorentini at Naples in 1772. The work met with approval, and was followed in the same year by *Le Pazzie di Stellidanza e di Zoroastro*, a farce full of humour and eccentricity. This work also was successful, and the fame of the young composer began to spread all over Italy. In 1774 he was invited to Rome to write an opera for the *stagione* of that year; and he there produced another comic opera called *L’Italiana in Londra*.

The next thirteen years of Cimarosa’s life are not marked by any event worth mentioning. He wrote a number of operas for the various theatres of Italy, residing temporarily in Rome, in Naples, or wherever else his vocation as a conductor of his works happened to call him. From 1784–1787 he lived at Florence, writing exclusively for the theatre of that city. The productions of this period of his life are very numerous, consisting of operas, both comic and serious, cantatas, and various sacred compositions. The following works may be mentioned amongst many others:—*Caio Mario*; the three Biblical operas, *Assalone*, *La Giuditta*, and *Il Sacrificio d’Abramo*; also *Il Convito di Pietra*; and *La Ballerina Amante*, a pretty comic opera first performed at Venice with enormous success. None of these works have survived, and their individual merits hardly give us cause to regret their loss. Excessive productiveness of this kind cannot but become mechanical. But this is no fault of Cimarosa’s. The enormous demand of the Italian stage has become fatal to the genius of some of the most gifted composers of that country both in the last and in the present century. Looking at Cimarosa’s works collectively, it may be said that they represent a style of considerable individuality and a perfect mastership of dramatic effect, so far at least as the vocal part is concerned. Cimarosa’s orchestra, like that of most Italian composers, is somewhat meagre, but here also the comparatively primitive stage of orchestration at the time he wrote ought to be taken into account. Cimarosa seldom succeeds in the highest walks of his art. His comic operas are infinitely superior to those in which a tragic subject compelled him to attempt dramatic pathos. As far as grace and melodious charm are concerned, Cimarosa was surpassed by none of his contemporaries, not even by Paesello, with whom he shared for a long time the leadership of the Italian school.

In 1787 Cimarosa went to St Petersburg by invitation of the Empress Catherine II. At her court he remained four years and wrote an enormous number of compositions, mostly of the nature of *pièces d’occasion*. Of most of these not even the names are on record. In 1792 Cimarosa left St Petersburg, the northern climate of Russia proving hurtful to the native of Italy. By invitation of the Emperor Leopold II. he went to Vienna, and it was there that he produced the masterpiece on which his claim to immortality must mainly rest. *Il Matrimonio Segreto* ranks amongst the highest achievements

of light operatic music. In Italy it is surpassed by Rossini's *Barbieri* alone. After the lapse of more than eighty years it evinces its vitality at theatres and concert halls wherever the whole opera or detached pieces are heard. Its humour is founded on human nature itself, and is therefore independent of local and temporal conditions. 1793 Cimarosa returned to Naples where *The Secret Marriage* and other works were received with great applause. Amongst the works belonging to his last stay in Naples, the charming opera *Le Astuzie Femminili* may be mentioned. This period of his life is said to have been embittered by the intrigues of envious and hostile persons, amongst whom one is sorry to meet with Paesello his old rival. During the occupation of Naples by the troops of the French Republic, Cimarosa joined the liberal party, and on the return of the Bourbons, was like many of his political friends condemned to death. By the intercession of influential admirers his sentence was commuted into banishment, and the composer left Naples with the intention of returning to St Petersburg. But his health was broken, and after much suffering he died at Venice in 1801 of inflammation of the intestines. The nature of his disease led to the rumour of his having been poisoned by his enemies, which, however, a formal inquest proved to be unfounded. He worked till the last moment of his life, and one of his operas, *Artemisia*, remained unfinished at his death.

(F. H.)

CIMBRI, or CIMBRIANS (Greek, Κίμβροι), an ancient nation of unknown affinity, which was one of the most formidable enemies of the Roman power, and has proved one of the most difficult subjects for the historical investigator. About 113 B.C., in company with the Teutones, they defeated the consul Papirius Carbo near Noreia in Styria; and in 109 B.C. they routed another army under the consul Silanus. By the latter success they opened their way to Gallia Narbonensis; and in 105 B.C. they began to threaten the Roman territory itself. They were joined by the Gauls from all quarters; and the Roman army sent against them under Cæpio and Manlius was almost exterminated. Only ten men with two generals are said to have escaped; and, in accordance with a vow which they had made before the battle, the conquerors destroyed all the spoil. The gold and silver they flung into the Rhone; they drowned the horses, and put all the prisoners to death. The Romans were thrown into consternation; but a new army was raised with all expedition, and the command was bestowed on Marius, who at that time enjoyed a high reputation on account of his victories in Africa. The Cimbri were approaching over the eastern Alps, and the Teutones and the other allies over the western. He first attacked and defeated the latter division at Aquæ Sextiæ, and then returned to face the Cimbri, who had meanwhile seen the backs of the soldiers of Catullus and Sylla. The vast host attacked the Romans with the utmost fury in the Campi Randii near Verecellæ (101 B.C.); but, unaccustomed to the heats of Italy, they soon began to yield and were easily overcome. They had put it out of their own power to fly; for, that they might the better keep their ranks, they had, like true barbarians, tied themselves together. It is said that 120,000 were killed on the field of battle and 60,000 were taken prisoners. The people of the Italian districts known as the Sette Comuni in Vicenza and the Tredeci Comuni in Verona have a belief that they are descended from the remnants of the Cimbrian army, but it is much more probable that they are the posterity of German settlers introduced by the bishops of Trent. Be this at it may, it is certain that after the victory of Marius the Cimbri were no longer of much importance as antagonists of Rome.

Two great questions have claimed the attention of the

historian in regard to this people; but to neither of them has anything like a definite answer been obtained. The first has to do with their local habitation, and the second with their ethnographical connection. Cæsar, Sallust, Cicero, and Diodorus Siculus seem to have regarded them as Gauls, and assign them a position within the Gallic area; whereas Strabo, Velleius Paterculus, and Tacitus treat them as Germans and locate them beyond the Rhine. The modern district of Jutland was familiarly known as the Cimbric Chersonese, and mention is made in the *Mon. Ancyranum* of an embassy from the Cimbrians of that peninsula to Augustus. Beyond this our ancient authorities do not carry us, and modern discussion has done little but maintain a continual oscillation of opinion. That they were closely connected with the Teutones is evident, and that the Teutones at least were Germanic was for a time regarded as certain; but more elaborate investigation shows that even this is open to dispute, and can afford no support as an argument. The ancient identification of the people with the Cimmerii and the modern identification with the Cymry are well-nigh exploded, and probably owe their origin to mere similarity of names.

See Cellarius *De Cimbris et Teutonibus*; Joh. von Müller, *Bellum Cimbricum*, 1776; Schiern, *De Cimbrorum Origine et Migrationibus*, 1842; Latham, Appendix to edition of the *Germania* of Tacitus; and a paper read by Canon Rawlinson before the Anthropological Institute, May 1876.

CIMMERII, or Cimmerians, a nomadic people of antiquity who dwelt near the Palus Mæotis or Sea of Azoff, in the Tauric Chersonese or Crimea, and in the Asiatic Sarmatia or the country of the lower Volga. They are said to have desolated Asia Minor prior to the time of Homer; and in their second invasion they penetrated as far westward as Æolis and Ionia, captured Sardis the capital of Lydia in the reign of Ardys, and continued in possession till they were driven out of Asia by Alyattes, the grandson of that sovereign. The fears of the Ionians are commemorated in the elegiac fragments of Callinus.

The name Cimmerii is also given to a mythical people, represented by Homer as inhabiting a remote region of mist and darkness, but localized by later writers near Lake Avernus, or in the Tauric Chersonesus, or in Spain. Their country was fabled to be so gloomy, that the expression "Cimmerian darkness" became proverbial; and Homer, according to Plutarch, drew his images of hell and Pluto from the dismal region they inhabited.

CIMON, an Athenian statesman, was the son of Miltiades. His father died in disgrace, leaving the fine which had been imposed on him unpaid. After a time it was paid by Cimon, who, according to one account, also took his place in prison. Distinguished by military ability, by a gentle and agreeable temper, and by the most open-handed liberality, Cimon gradually rose to the front rank among his contemporaries. His victorious attacks on the Persians, his ostracism, his request for leave to fight at Tanagra, and his recall on the motion of his rival Pericles are matters of history. (See GREECE.) He died while besieging Citium, 449 B.C.

CINCHONA, the generic name of a number of trees belonging to the Natural Order *Rubiaceæ*, but which, with a few allied genera, have been by some authorities established as a distinct order under the name *Cinchonaceæ*. Botanically the genus includes trees of varying size, some reaching an altitude of 80 feet and upwards, with evergreen leaves and deciduous stipules. The flowers are arranged in panicles, white or pinkish in colour, with a pleasant odour, the calyx being 5-toothed superior, and the corolla tubular, 5-lobed, and fringed at the margin. The stamens are 5, almost concealed by the tubular corolla, and the ovary terminates in a fleshy disk. The fruit is

an ovoid or sub-cylindrical capsule, splitting from the base, and held together at the apex. The numerous seeds are flat and winged all round. According to the enumeration of Bentham and Hooker, 36 species have been distinguished, but of these not more than about a dozen have been economically utilized. The plants are natives of the western mountainous regions of South America, their geographical range extending from 10° N. to 22° S. lat.; and they flourish generally at an elevation of from 5000 to 8000 feet above sea level, although some have been noted growing as high up as 11,000 feet, and others have been found down to 2600 feet.

The trees are valued solely on account of their bark, which as cinchona bark, Jesuits' bark, or Peruvian bark is, and long has been, the source of the most valuable tonic and febrifuge medicines that have ever been discovered. The earliest well-authenticated instance of the medicinal use of cinchona bark is found in the year 1638, when the countess of Chinchon, the wife of the governor of Peru, was cured of an attack of fever by its administration. The medicine was recommended in her case by the corregidor of Loxa, who was himself said to have practically experienced its supreme virtues eight years earlier. The name *Cinchona* is due to the connection of the countess of Chinchon with the introduction of the remedy; and it is argued by Mr Markham and others that therefore the term should be written *Chinchona*. A knowledge of the virtues of the bark was disseminated throughout Europe by members of the Jesuit brotherhood, whence it also became generally known as Jesuits' bark. According to another account, this name arose from its value having been first discovered to a Jesuit missionary who, when prostrate with fever, was cured by the administration of the bark by a South American Indian.

The procuring of the bark in the dense forests of New Granada, Ecuador, Peru, and Bolivia is a work of great toil and hardship to the Indian *Cascarilleros* or *Cascadores* engaged in the pursuit. The trees grow isolated or in small clumps which have to be searched out by the experienced *Cascarillero*, who laboriously cuts his way through the dense forest to the spot where he discovers a tree. Having freed the stem from adhering parasites and twining plants, he proceeds, by beating and cutting oblong pieces, to detach the stem bark as far as is within his reach. The tree is then felled, and the entire bark of stem and branches secured. The bark of the smaller branches, as it dries, curls up, forming "quills," the thicker masses from the stems constituting the "flat" bark of commerce. The drying, packing, and transport of the bark are all operations of a laborious description conducted under most disadvantageous conditions.

The enormous medicinal consumption of these barks, and the wasteful and reckless manner of procuring them in America long ago, caused serious and well-grounded apprehension that the native forests would quickly become exhausted. The attention of European communities was early directed to the necessity of securing steady and permanent supplies by introducing the more valuable species into localities likely to be favourable to their cultivation. The first actual attempt to rear plants was made in Algeria in 1849; but the effort was not successful. In 1854 the Dutch Government seriously undertook the task of introducing the trees into the island of Java, and an expedition for that purpose was fitted out on an adequate scale. Several hundreds of young trees were obtained, of which a small proportion was successfully landed and planted in Java; and as the result of great attention the cultivation of cinchona plantations in that island is now highly prosperous and promising. The desirability of introducing cinchonas into the East Indies was urged in a memorial addressed to the East India Company between 1838 and

1842 by Sir Robert Christison and backed by Dr Forbes Royle; but no active step was taken till 1852, when, again on the motion of Dr Royle, some efforts to obtain plants were made through consular agents. In the end the question was seriously taken up, and Mr Clements R. Markham was appointed to head an expedition to obtain young trees from South America and convey them to India. In 1860 under Mr Markham's superintendence a first consignment of plants was shipped from Islay in Peru, and planted in a favourable situation in the Neilgherry Hills. For several years subsequently additional supplies of plants of various species were obtained from different regions of South America, and some were also procured from the Dutch plantations in Java. Now the culture has spread over a wide area in Southern India, in Ceylon, on the slopes of the Himalayas, and in British Burmah; and recently plantations which already present a promising appearance have been established in Mauritius. Exclusive of private enterprise, the trees in the Government plantations in India now amount to several millions, and in the Neilgherry plantations they have attained a height of from 20 to 30 feet. The species introduced in the East are principally *Cinchona officinalis*, *C. Calisaya*, *C. succirubra*, *C. pitayensis*, and *C. Pahudiana*, some agreeing with certain soils and climates better than others, while the yield of alkaloids and the relative proportions of the different alkaloids differ in each species.

In the original memorial above alluded to, presented to the East India Board by Sir R. Christison, he, according to a communication to the Edinburgh Botanical Society (*Trans.*, vol. xi. p. 111), pointed out that "the transplantation, if successful, would become remunerative. For although it would be a very arduous undertaking were the bark to be collected only by cutting down large trees, which do not attain sufficient growth in less than twenty or twenty-five years, being the only American method, the case would be very different were it shown that bark could be profitably taken from trees very much younger, and without either destroying or even injuring them. Now, I had ascertained," continues Sir Robert, "by chemical analysis that—contrary to the analysis of some French chemists—sulphate of quinia was to be obtained from fine quills of yellow bark taken from twigs two or three years old in as large proportion as from the large flat bark from the trunks and great branches. Consequently, as it appeared, from the facility with which the trees grew in their native forests by suckers from the old roots, when the trunks are properly cut down, that young twigs might safely be cut from them at an early period, it followed that the collection of cinchona bark might be conducted in the same way as that of cinnamon bark at Colombo, where only twigs of one or two years' growth are cut for the purpose, and without injuring the trees. . . . This doctrine has proved true, so true that it has been found suitable in India even to treat the cinchona plants like osier beds in England, by cutting them down altogether when young, thus using only twigs for the bark, and trusting to suckers for renewing the growth of the plants; and that the result has been the introduction of fine bark from India in such bulk as to have been sold by auction in the London market only nine years after the first cinchona plants were transplanted to India." Mr. W. G. M'Ilvor, to whom the success of Indian plantations is largely due, introduced a system of mossing the plants, which consists in wrapping the growing stems in a layer of damp moss, whereby the yield of alkaloid is increased, and the growth of renewed bark promoted. It has been pointed out by Dr De Vrij, and the observation is confirmed by Mr D. Howard, that renewed bark contains the alkaloids not only in different proportions from the

original bark, but that it even develops principles altogether absent in the natural bark.

The official barks of the *British Pharmacopœia* are three in number:—(1) the pale or Loxa bark (*cortex cinchonæ pallidæ*) yielded by *Cinchona officinalis*; (2) the yellow, royal, or Calisaya bark (*cortex cinchonæ flavæ*), the produce of *C. Calisaya*; and (3) red bark (*cortex cinchonæ rubra*) derived from *C. succirubra*. These are the sources of the tinctures, extracts, and other preparations of pharmacy, while, in common with several others, they also yield the alkaloids which now constitute the chief form in which the active principles of the barks are administered in medicine. Among the other barks used as sources of quinine, &c., the principal are—the ashy crown bark, *C. macrocalyx*; Carthagen bark, *C. lanceolata*; Columbian bark, *C. lancifolia*; Pitayo bark, *C. pitayensis*; grey or Lima bark, *C. micrantha*, *C. nitida*, and *C. peruviana*.

Leaving out of view certain alkaloids unimportant as yet in a commercial view, and found very sparingly in particular barks, the four primary alkaloids yielded by cinchona barks are quinine, quinidine, cinchonine, and cinchonidine. Certain secondary alkaloids are developed by chemical treatment of these primary principles, and an amorphous substance precipitated from the mother liquors of the quinine manufactured under the name of quinoidine is in considerable medicinal use. Much confusion has arisen in the terminology of the alkaloids by the application of the same name to chemically distinct principles, and by the converse description of the same alkaloids or products under different names. It is found that different barks derived from the same species vary greatly in richness in alkaloids, and that equally great fluctuations occur in the relative proportions of the various principles they yield. When a comparison is instituted among the barks of different species the variations are of course even more marked,—some barks having been found to yield as high as 13 per cent. of alkaloids, while in others not a trace has been obtained. Certain barks, however, are known as a rule to contain quinine in largest proportion, and in others cinchonine is the most abundant principle. Generally quinine is the most constant and abundant constituent, after which cinchonine, then cinchonidine, while quinidine is the rarest both in proportion and in frequency of occurrence of the principal alkaloids.

The preparation of cinchona bark most extensively employed in medicine is the alkaloid quinine in the form of a sulphate. As the barks from which it is extracted contain besides proportions of one or other of the principal alkaloids above enumerated, a demand for any of them might be supplied without interfering with the production of quinine, and as they also have been proved to be potent febrifuges their non-utilization is a regrettable waste. From the record of an extensive series of experiments instituted by the Indian Government it is demonstrated that quinidine is even more active than quinine, and it forms the principal constituent of a variety of calisaya bark in extensive cultivation in Java. Cinchonidine is only a little less powerful in its febrifugal effect than quinine, and it is abundantly formed by the red bark cultivated in British India. Cinchonine, although the least potent, is an abundant principle, and still a highly valuable and efficient remedial agent. (J. P.A.)

CINCINNATI, an important city of the United States, situated in the S.W. part of Ohio, on the N. bank of the Ohio River, in 39° 6' N. lat. and 84° 26' W. long. It is the capital of Hamilton county, and in size is the first city in the State, while, according to the Federal census of 1870, it is the eighth in the United States. It was first settled in 1788 by persons from New Jersey, and is said to have been named in honour of the Cincinnati Society of officers

of the Revolutionary war. It was incorporated as a city in 1814, and soon acquired a commercial importance which has steadily increased. In 1800 Cincinnati contained but 750 inhabitants. The population amounted to 9602 in 1820, 46,338 in 1840, 115,436 in 1850, 161,044 in 1860, and 216,239 in 1870. Of the total population in 1870, 79,612 were foreigners, including 49,448 born in Germany, 18,624 in Ireland, 3526 in England, and 2093 in France. The city is chiefly built upon two terraces or plateaus, the first 60 and the second 112 feet above the river. Beyond these rises an amphitheatre of hills from 400 to 450 feet high, from which may be obtained a magnificent view of the valley of the Ohio and the surrounding country. On the opposite bank of the river, in the State of Kentucky, are Covington, which had 24,505 inhabitants in 1870, and Newport, which had 15,087. Communication between these cities and Cincinnati is afforded by two bridges and three steam ferries. The wire suspension bridge, which is 1057 feet long between the towers (or, including the approaches, 2252 feet), with a height of 100 feet above low water, was completed in 1867 at a cost of nearly \$2,000,000. It has a double waggon road, and two ways for pedestrians. Further up the river is a wrought iron railroad bridge built upon piers; besides a railway track, it has waggon and foot ways. Cincinnati covers an area of 24 square miles, extending along the river about 10 miles, with an average width of 3 miles. The most important part of the city, however, is comprised within a distance of 2½ miles along the river. The corporate limits have been much extended in recent years by the annexation of numerous villages, the most important being Columbia, Walnut Hills, Mount Auburn, and Cumminsville. In these, which still retain their former names, are seen the most costly residences and villas, with ornamental grounds embracing from 5 to 80 acres each. The city is also noted for the beauty of its suburbs and its surrounding scenery. The streets, which generally cross one another at right angles, are usually from 1½ to 2½ miles long, and from 50 to 100 feet wide. Many of them are lined with trees. Brick is chiefly used for buildings, with a greyish buff freestone for fronts. Business buildings are usually five and often six stories high. Cincinnati is well supplied with public parks, the largest of which, Eden, is situated on a hill in the eastern part of the city, and contains 216 acres. In Burnet Woods, recently purchased, there are 170 acres, mostly forest, on the hill north of the city. Centrally situated in the city are Washington, Lincoln, Hopkins, and the City parks, which together contain about 25 acres. One of the most attractive objects in the city is the Tyler Davidson bronze fountain which was unveiled in 1871. It was presented to the city by Mr Henry Probascio, a wealthy citizen, who named it after the late Mr Tyler Davidson, the originator of the proposal. Its cost was nearly \$200,000. The design embraces fifteen bronze figures, all east at Munich, the chief one representing a female with outstretched arms, from whose fingers the water falls in fine spray. This is the surmounting figure, and reaches a height of 45 feet above the ground. Among the most notable buildings is that of the Federal Government, built of sawed freestone in the Roman Corinthian style, with a porch of six columns; it is three stories high, with a length of 150 feet and a width of 80 feet. The county court-house, in the same style of architecture, is 175 feet square and three stories high, and has a porch with six Corinthian stone columns. The brick buildings for the city offices are 205 feet long and 52 feet wide. The city workhouse, 3½ miles from the heart of the city, is a brick structure, 515 feet long and 55 feet wide, erected at a cost, including 26 acres of land, of \$650,000. It

has room for 700 prisoners. The Cincinnati hospital, comprising eight buildings arranged around a central court and connected by corridors, occupies a square of 4 acres. It cost more than \$1,000,000, and will accommodate 700 patients. The Masonic Temple, built in the Byzantine style, 195 feet long and 100 feet wide, is four stories high, and has two towers 140 feet, and a spire 180 feet high. Other noticeable structures are Pike's Opera House, 170 by 134 feet, and five stories high, the Public Library, St Xavier's College, the Wesleyan Female College, and the Hughes High School. The most imposing church edifices are St Peter's Roman Catholic Cathedral, built in

pure Grecian style, 200 by 80 feet, with a stone spire rising to a height of 224 feet; St Paul's Church (Methodist), with a spire 200 feet high; the First Presbyterian Church, with an immense tower surmounted by a spire 270 feet high; St John's Episcopal Church; and two large and attractive Hebrew temples.

Cincinnati is one of the most important commercial and manufacturing centres of the West. The six railroads entering the city are used by twelve companies, and besides these two lines terminate at Covington on the opposite side of the river. About 300 passenger and freight trains arrive and leave daily on these roads. For their use are

Plan of Cincinnati.

four depôts near the river in different parts of the city. Communication with different parts of the city and with the suburbs is afforded by fourteen lines of street railroad, with about 50 miles of track, and by numerous lines of omnibuses and stages. The top of the adjacent hills is reached by an inclined steam passenger-railway. The position of the city on the Ohio River gives it water communication with the extensive river system of the Mississippi valley; while it is connected with Lake Erie by the Miami Canal, whose northern terminus is at Toledo, Ohio. The Miami is connected by a branch with the Wabash and Erie Canal, the largest in the United States (467 miles), which extends from Toledo to Evansville, Indiana, on the Ohio river. The average yearly number of steamers and barges running between Cincinnati and other ports during the ten years ending with August 1875 was 338; the yearly number of arrivals of steamers during this period was 2713, and of departures 2680. The large steamers of the Mississippi river are enabled to reach Cincinnati by means of the canal around the falls of the Ohio at Louisville, Kentucky, which was opened in 1872. About three-fourths of the commerce of the city is by railroad and canal, and the remainder by river transportation. The extent of the entire commerce is indicated by the value of imports, which during the ten years ending in 1875 averaged \$314,528,009 a year, and of exports, which averaged \$201,236,066.

Cincinnati is one of those interior ports to which, under the Act of Congress passed in 1870, foreign merchandise may be transported without appraisement and payment of duties at the port of first arrival. The value of such imports to this city during the year ending June 30, 1875, was \$566,989. The total value of the products of manufacturing industry has increased from \$46,995,062 in 1860 to \$127,459,021 in 1870 and \$144,207,371 in 1874. The details for the last-mentioned years are as follows:—

Industries.	1870.		1874.	
	Hands Employed.	Value of Products.	Hands Employed.	Value of Products.
Iron.....	10,723	\$20,804,263	8,713	\$17,123,224
Other metals.....	1,509	3,873,256	2,147	4,871,272
Wood.....	7,537	12,639,167	7,977	13,776,666
Leather.....	4,647	1,237,324	4,929	7,601,115
Food.....	2,334	17,455,631	4,957	24,671,957
Soap, candles, and oils.....	1,122	7,455,561	1,613	2,227,545
Clothing.....	12,563	12,626,682	15,115	15,223,214
Beer and whisky.....	1,035	16,611,066	1,325	24,231,372
Cotton, wool, hemp, &c.....	1,035	1,854,774	832	1,262,169
Drugs, chemicals, &c.....	725	3,544,135	576	3,567,273
Stone and earth.....	2,269	2,950,162	2,159	3,916,401
Carriages, cars, &c.....	1,175	1,791,413	1,571	1,841,596
Paper, &c.....	452	880,516	625	1,677,223

Miscellaneous.....	4,177	5,697,427	1,560	4,562,223
Total.....	63,527	127,459,021	60,929	144,207,371

Boat-building was formerly a prominent industry, but it has recently declined. Prior to 1863 Cincinnati was the chief centre in the United States for the slaughtering of swine and the packing of pork. Since that year this supremacy has been held by Chicago, Cincinnati taking the second rank. There are more than seventy establishments in the latter city employed in this industry. The United Railroads Stock-yards for the reception of live pigs occupy about 60 acres. During the winter season of 1874-75 there were slaughtered 560,164 hogs, weighing in the aggregate 155,864,126 lb, and valued at \$10,897,584. The production included 44,232 barrels of pork, and 23,400,157 lb of lard. During the year ending August 31, 1875, pork and bacon valued at \$12,645,538 were exported from the city; the imports amounted to \$2,580,493. The excess of exports of lard over imports was \$2,781,091. After this important industry the brewing of lager beer ranks next, the brewers here turning out about 15,000,000 gallons annually. Distillation is also carried on to a very considerable extent. The city contains five national banks with a capital of \$4,000,000, and seventeen private banks with a capital of \$2,740,000. The leading commercial organization is the Chamber of Commerce and Merchants' Exchange, which has about 1200 members and holds daily sessions. The Board of Trade has about 900 members, chiefly manufacturers. There are also a mechanics' institute, cotton exchange, and pork packers' association. An industrial exhibition has been held in the autumn of each year since 1871, and has attracted large numbers of visitors to the city. The buildings are centrally situated, and occupy 3½ acres of ground.

The city is divided into 25 wards, and is governed by a mayor, who is elected by the people for two years, and receives an annual salary of \$4000, a board of 25 aldermen, and a board of 50 councilmen, who are also elected by the people. It has a paid fire department under the control of five commissioners appointed by the mayor, and a police force under the control of the mayor and four commissioners. The efficiency of these departments is promoted by extensive fire-alarm and police telegraphic lines. The city is supplied with water obtained by pumping from the Ohio river by means of three immense reservoirs, two of which, with a capacity of 100,000,000 gallons each, are in Eden Park. Beside the usual municipal and county courts, the United States circuit and district courts for the southern district of Ohio are held in the city.

Cincinnati has a large number and variety of well-organized charitable institutions. The Cincinnati hospital is supported by taxation, and affords free treatment to all unable to pay for it; the city infirmary, besides supporting pauper inmates, affords relief to outdoor poor; the Good Samaritan and St Mary's hospitals are private institutions, under the supervision of Roman Catholic sisters; the Jewish hospital is maintained by persons of that faith. The Longview asylum for the insane, built at Carthage, 10 miles from the city, at a cost, including 110 acres of land, of \$1,000,000, ranks among the first institutions of the kind in the United States. It belongs to Hamilton county, whose population consists chiefly of the inhabitants of Cincinnati; patients are, however, sent here by the State, which contributes to its support. The average daily number of inmates in 1874 was 582, nearly all of whom were maintained free of charge. Besides the city orphan asylum, which has accommodation for 300 children, and is supported by private charity, and the German Protestant asylum, with a capacity for about 100, two large asylums are maintained by the Roman Catholics and by the coloured people. There are also several institutions for indigent and friendless women. The house of refuge and the city workhouse are maintained by the city for

the confinement of persons convicted of minor offences; children are sent to the former, and adults to the latter.

The public schools are under the control of a superintendent and a board of 50 elected members, and comprise 3 high, 5 intermediate, and 30 district schools, including those for coloured pupils. There are also a normal school for females and evening schools. In 1874 there were 529 teachers and 28,949 pupils enrolled, with an average daily attendance of 21,486. German is a prominent study in the public schools, and music and drawing are taught. The Woodward and the Hughes high schools have long been known for their excellence. Besides the above, there are a large number of Roman Catholic parochial schools. The university of Cincinnati, recently founded by means of a bequest made by Charles M'Micken, is designed to afford advanced and technical instruction free of charge. A school of design has been in operation since 1869. Besides the Cincinnati Wesleyan College for females (Methodist-Episcopal), St Xavier College (Roman Catholic), and Mount St Mary's of the West, the city has 1 law, 6 medical, and 2 theological schools, 4 commercial colleges, and 2 schools of music. One of the theological schools is connected with Mount St Mary's of the West, the other is the widely-known Lane Theological Seminary (Presbyterian), founded in 1829. It occupies a site of 7 acres on Walnut Hills, and has 5 professors and a library of 12,000 volumes. Three of the medical schools are classified as regular, one as pharmaceutic, one as homœopathic, and one as dental. The oldest is the medical college of Ohio, which was opened in 1819, and now has 10 instructors; the Cincinnati college of medicine and surgery was opened in 1821, and has 14 instructors; the Miami medical college, opened in 1852, has 12 instructors; and the Pulte medical college, opened in 1872, has 14. There are 11 public libraries in the city, the largest being the free public library, which has 81,000 bound volumes and 5500 pamphlets, and the young men's mercantile with nearly 40,000 volumes. The public library occupies one of the best library buildings in the country. The most important literary associations are the natural history and the historical and philosophical societies. There are published in the city 70 newspapers and periodicals,—9 appearing daily, 1 twice a-week, 33 weekly, 3 fortnightly, 21 monthly, and 3 quarterly. Of these 3 daily, 9 weekly, 1 fortnightly, and 2 monthly are published in German. The city contains 160 churches, the largest denominations being the Roman Catholic, which has 32 churches and 12 chapels, the Methodist with 26 churches, the Presbyterian with 22, the Baptist with 14, and the Protestant Episcopal with 11.

(C. S. DR.)

CINCINNATUS, the hero of one of the early Roman legends, was born about 519 B.C. According to the story, he was ruined by the fine which was imposed on his son Cæso for the murder of a plebeian during the commotions caused by the introduction of a bill by Terentilius Arsa. This measure, which proposed the creation of a code of written laws applicable to plebeian and patrician alike, was also strongly opposed by Cincinnatus himself. Cincinnatus is, in fact, the type of the ancient patrician agriculturist. Twice he was called from the plough to the dictatorship of Rome. On the first occasion his task was to save the army from the Æquians and Volscians, who had forced it into a position of imminent danger; and he is said to have raised an army and defeated the enemy within a single day (458). On his return he summoned Volscius, the accuser of his son, to take his trial on a charge of perjury; but Volscius fled from the city. On the second occasion (439) he was appointed by the patricians, in order to crush Spurius Mælius, who had spent his wealth in relieving the wretched debtors, and who was consequently accused of

desiring popularity that he might seize the supreme authority. Marius, refusing to appear before the dictator, was killed by Ahala, the master of the horse.

CINEAS, a Thessalian, the chief adviser of Pyrrhus, king of Epirus. The most famous event of his life was the visit which he made to Rome for the purpose of concluding the war, after the defeat of the Romans by Pyrrhus at Heraclea (280 B.C.) He performed the feat of learning in one day the name of every man of importance in the city, and displayed besides the most marvellous tact and eloquence; but the effects of his persuasion being destroyed through the patriotic vehemence of the venerable Appius Claudius Cæcus, he returned to his master with the report that Rome was a temple, and its senate an assembly of kings. Cineas also served as an ambassador in Sicily. He is perhaps the Cineas referred to by Cicero as the author of a work *De Re Militari*.

CINNA, LUCIUS CORNELIUS, a Roman patrician, conspicuous in the contest between Marius and Sulla. After serving in the war with the Marsi as pretorian legate, he was elected consul in 87 B.C. Breaking the oath he had sworn to Sulla that he would not attempt any revolution in the state, Cinna allied himself with Marius, raised an army of Italians, and took possession of the city. Soon after his triumphant entry and the massacre of the friends of Sulla, by which he had satisfied his vengeance, Marius died. L. Valerius Flaccus became Cinna's colleague, and on the murder of Flaccus, Cn. Papirius Carbo. In 84, however, Cinna, who was still consul, was forced to advance against Sulla; but while embarking his troops he was killed in a mutiny. See ROMAN HISTORY.

CINNABAR, the *κιννάβαρις* of Theophrastus, is the native sulphide of mercury, and the only commercial source of that metal and its compounds. It crystallizes in the rhombohedral form, in which condition it is sometimes found; but generally it occurs in fibrous or amorphous masses bedded in slate rocks and shales, and more rarely in veins in granitic or porphyritic rocks. In hardness it is intermediate between gypsum and calc spar; its specific gravity is 8.998, and its colour varies from a fine bright red to a reddish-brown and leaden-grey hue. It possesses the same composition as the ordinary vermilion of commerce for which it may, when pure and fine in colour, sometimes be used after simple levigation, although the greater part of that brilliant pigment is artificially prepared. Pure cinnabar should contain 86.21 per cent. of mercury, combined with 13.79 of sulphur; but in its native state the ore is frequently contaminated with oxide of iron, clay, and bituminous matter. The principal European localities for cinnabar are at Idria in Carniola, and at Almaden in Spain, whence the British demand is mainly supplied. It is also extensively worked at New Almaden and several other localities in California, in the southern part of Peru, and in Borneo, Japan, and China. See VERMILION.

CINNAMON is the inner bark of *Cinnamomum Zeylanicum*, a small evergreen tree belonging to the Natural Order *Lauraceæ*. The leaves are large ovate-oblong in shape, and the flowers, which are arranged in panicles, have a greenish colour and a rather disagreeable odour. Cinnamon has been known from the most remote antiquity, and it was so highly prized among ancient nations that in very small quantities it was regarded as a present fit for monarchs and other great potentates. It is mentioned in Exod. xxx. 23, where Moses is commanded to use both sweet cinnamon (*Kinnamon* and cassia. It is likewise alluded to by Herodotus under the name *κιννάμωμον*, and it is frequently mentioned by many other classical writers. It is now almost exclusively a product of Ceylon, but the origin of the plant and the derivation of its name are matters of considerable doubt and dispute. The Arab traders, by

whom the trade in this and other Oriental spices was conducted in ancient times, surrounded the history and production of these precious and lucrative products with grotesque tales of mystery. It is contended by some that cinnamon was originally obtained from the promontory of Gardafui (the *regio cinnamomifera* of classical geographers), while others lean to the opinion that it was brought from China, whence the chief portion of the closely allied cassia bark is still derived. Although as the produce of Ceylon, cinnamon did not come prominently into the market till the settlement of the Portuguese in the island, it is the opinion of the best authorities that the tree yielding it is indigenous, and certainly no other situation and climate have yet been found where the trees flourish so well and yield a bark so fine and so delicately aromatic.

The cinnamon gardens are confined to a strip of country in the neighbourhood of Colombo. When the trade was at its best, five of the principal gardens measured from 15 to 20 miles in circumference, but now the area of cultivation is very much restricted, and plants which were at one time tended with the greatest care, and guarded with inhuman jealousy, are choked with the natural profusion of jungle vegetation. The bark is taken from shoots of eighteen months or two years growth, in which time they attain a length of from 6 to 10 feet, and a thickness of from $\frac{1}{2}$ to 2 inches. The plants are managed on the coppice system, and only four or five shoots are allowed to grow up from each stool. The shoots are cut down twice a year after the rains, and the bark is detached in lengths of about a foot. After lying in bundles as taken from the shoots for about a day, each separate piece is carefully scraped to remove the outer and middle layers of the bark, and the remaining portion is thereby often reduced to the thickness of one-hundredth part of an inch. The pieces are then made up into composite quills by placing the smaller pieces inside the larger, and thus the cinnamon is often formed into straight firm rods of from 3 to 4 feet in length. After drying in the sun the bark is ready to make up into bundles for exportation.

Cinnamon of an inferior quality is grown in Southern India at Tellicherry and Tinnevely; and in Java the cultivation was introduced by the Dutch about the year 1825. The plant has also been grown in the colony of French Guiana, and in other localities. The produce of none of these places, however, approaches in quality to the cinnamon of Ceylon, whence also the largest proportion of the entire consumption is supplied. Nearly the whole quantity prepared in Ceylon is brought to the British market. The value of Ceylon cinnamon submitted to the English Board of Trade, was in 1874 more than 2s. 2d. per lb, that from other localities being estimated at about 10d.

Ceylon cinnamon of fine quality is a very thin smooth bark, with a light-yellowish brown colour, a highly fragrant odour, and a peculiarly sweet, warm, and pleasing aromatic taste. Its peculiar flavour is due to an aromatic oil which it contains to the extent of from 0.5 to 1 per cent. The essential oil of cinnamon, as an article of commerce, is prepared chiefly in Ceylon, where the coarser pieces of bark are used for its extraction. These are roughly powdered and macerated in sea water for two days, when the whole is quickly distilled. The oil is of a golden-yellow colour, with the peculiar odour of cinnamon and a very hot aromatic taste. It consists essentially of cinnamic aldehyde or the hydride of cinnyl, and by the absorption of oxygen as it becomes old it darkens in colour and develops resinous compounds with cinnamic acid.

Cinnamon is principally employed in cookery as a condiment and flavouring material, being largely used in the preparation of some kinds of chocolate and liqueurs. In medicine it acts as an aromatic stimulant and cordial; but

it is chiefly prescribed for improving the flavour of bitter substances and to correct the griping action of purgatives. Being a much more costly spice than cassia, that comparatively harsh-flavoured substance is frequently substituted for or added to cinnamon. The two barks when whole are easily enough distinguished, and their microscopical characters are also quite distinct. When powdered bark is treated with tincture of iodine, little effect is visible in the case of pure cinnamon; but with cassia a deep-blue tint is produced, the intensity of the coloration depending on the proportion of the cassia.

CINO DA PISTOIA (1270–1336), a poet and jurist, whose full name was GUITTONCINO DE' SINIBULDI, was born in Pistoia, of a noble family. He studied law at Bologna under Dinus and Franciscus Accursius, and in 1307 is understood to have been assessor of civil causes in his native city. In that year, however, Pistoia was disturbed by the Guelph and Ghibelline feud. The Ghibellines who had for some time been the stronger party, being worsted by the Guelphs, Cino, a prominent member of the former faction, had to quit his office and the city of his birth. Pitecchio, a stronghold on the frontiers of Lombardy, was yet in the hands of Filippo Vergiolesi, chief of the Pistoian Ghibellines; Selvaggia, his daughter, was beloved by Cino (who was probably already the husband of Margherita degli Ungli); and to Pitecchio did the lawyer-poet betake himself. It is uncertain how long he remained at the fortress; it is certain, however, that he was not with the Vergiolesi at the time of Selvaggia's death, which happened three years afterwards (1310), at the Monte della Sambuca, in the Apennines, whither the Ghibellines had been compelled to shift their camp. He visited his mistress's grave on his way to Rome, after some time spent in travel in France and elsewhere, and to this visit is owing his finest sonnet. At Rome Cino held office under Louis of Savoy, sent thither by the Ghibelline leader Henry of Luxembourg, who was crowned emperor of the Romans in 1312. In 1313, however, the emperor died, and the Ghibellines lost their last hope. Cino appears to have thrown up his party, and to have returned to Pistoia. Thereafter he devoted himself to law and letters. After filling several high judicial offices, a doctor of civil law of Bologna in his forty-fourth year, he lectured and taught from the professor's chair at the universities of Treviso, Siena, Florence, and Perugia in succession; his reputation and success were great, his judicial experience enabling him to travel out of the routine of the schools. In literature he continued in some sort the tradition of Dante during the interval dividing that great poet from his successor Petrarca. The latter, besides celebrating Cino in an obituary sonnet, has coupled him and his Selvaggia with Dante and Beatrice in the fourth *capitolo* of his *Trionfi d'Amore*.

Cino, the master of Bartolus, and of Joannes Andreæ the celebrated canonist, was long famed as a jurist. His commentary on the statutes of Pistoia, written within two years, is said to have great merit; while that on the code (*Lectura Cino Pistoia super Codice*, Pavia, 1483, Lyons, 1526) is considered by Savigny to exhibit more practical intelligence and more originality of thought than are found in any commentary on Roman law since the time of Accursius. As a poet he also distinguished himself greatly. He was the friend and correspondent of Dante's later years, and possibly of his earlier also, and was certainly, with Guido Cavalcanti and Durante da Maiano, one of those who replied to the famous sonnet *A ciascun' alma presa e gentil core* of the *Vita Nuova*. The great Florentine in the treatise *De Vulgari Eloquentia* refers to him as one of "those who have most sweetly and subtly written poems in modern Italian," but his works, printed at Rome in 1559, do not altogether justify the praise bestowed on them by his illustrious

friend. Strained and rhetorical as many of his outcries are, however, Cino is not without moments of true passion and fine natural eloquence. Of these qualities the sonnet in memory of Selvaggia, *Io fui in sull'alto e in sul beato monte*, and the canzone to Dante, *Avegnachè di omaggio più per tempo*, are interesting examples.

The text-book for English readers is Mr D. G. Rossetti's *Early Italian Poets*, wherein will be found not only a memoir of Cino da Pistoia (pp. 206–211), but also (pp. 381–395) some admirably translated specimens of his verse,—the whole wrought into significant connection with that friendship of Cino's, which is perhaps the most interesting fact about him. See also Ciampi, *Vita e Poesie di Messer Cino da Pistoia*, Pisa, 1813.

CINQ-MARS, HENRI COIFFIER DE RUZÉ, MARQUIS DE (1620–1642), French courtier, was born in 1620. At the age of eighteen he was introduced to the court by Richelieu, who had been the patron of his father, and who intended him to fill the post of favourite to the king, Louis XIII. The design succeeded well, and Cinq-Mars became grand master of the wardrobe, and grand master of the horse. He developed into a gallant courtier, won the affection of the princess of Mantua, and claimed a seat in the royal council. But Richelieu opposed his ambition, and refused to countenance his pretensions. Cinq-Mars, therefore, in revenge, entered into the conspiracy against him, of which the duke of Orleans was nominal head. Unfortunately aid had been sought from Spain; and using this treason as an argument, Richelieu persuaded the weak and fickle king first to forbid Cinq-Mars to enter his presence, and then to permit his execution (1642).

CINQUE PORTS. The Cinque Ports, or Five Ports, is the name of an ancient jurisdiction in the south of England, which is still maintained with considerable modifications and diminished authority. As the name implies, the original members of the body were only five in number—Hastings, Romney, Hythe, Dover, and Sandwich; but to these were afterwards added the "Ancient Towns" of Winchelsea and Rye with the same privileges, and a good many other places, both corporate and non-corporate, which, with the title of Limb or Member, held a subordinate position. To Hastings were attached the corporate members of Peveusey and Seaford, and the non-corporate members of Bulverheeth, Petit Ham, Hidney, Beaksbourne, and Grange; to Romney, Lydd, and Old Romney, Dengemarsh, and Oswardstone; to Dover, Folkstone and Feversham, and Margate, St John's, Goresend, Burelington Wood, St Peter's, Kingsdowne, and Ringwold; to Sandwich, Fordwich, and Deale, Walmer, Ramsgate, Stoner, Sarr, and Brightlingsea. The jurisdiction thus extends along the coast from Seaford in Sussex to Burghlington near Margate in Kent; and it also includes a number of inland districts, at a considerable distance from the ports with which they are connected. The non-incorporated members are within the municipal jurisdiction of the ports to which they are attached; but the corporate members are as free within their own liberties as the individual ports themselves. The incorporation of the Cinque Ports had its origin in the necessity for some means of defence along the southern seaboard of England, and in the lack of any regular navy. Up to the reign of Henry VII. they had to furnish the Crown with nearly all the ships and men that were needful for the state; and for a long time after they were required to give large assistance to the permanent fleet. The oldest charter now on record is one belonging to the 6th year of Edward I.; and it refers to previous documents of the time of Edward the Confessor and William the Conqueror. In return for their services the ports enjoyed extensive privileges. From the Conquest or even earlier they had, besides various lesser rights,—(1) Exemption from tax and tallage; (2) Soc and sac, or full cognizance of all criminal and civil cases within their liberties; (3) Toll and theam,

or the right of receiving toll and of holding serfs; (4) Bloodwith and fledwith, or the right to punish shedders of blood and those who were seized in an attempt to escape from justice; (5) Pillory and tumbrell; (6) Ingfangtheof and outfangtheof, or power to imprison and execute felons; (7) Mundbriech, or authority to erect banks or dykes on any man's land as a defence against the sea; (8) Waives and strays, or the right to appropriate lost property or cattle not claimed within a year and a day; (9) The right to seize all flotsom, jetsom, or witsom, or in other words, whatever of value was cast ashore by the sea; (10) The privilege of being a guild with power to impose taxes for the common weal; and (11) The right of assembling in portmote or parliament at Shepway or Shepway Cross, a few miles west of Hythe—the parliament being empowered to make bye-laws for the Cinque Ports, to regulate the Yarmouth fishery, to hear appeals from the local courts, and to give decision in all cases of treason, sedition, illegal coining, or concealment of treasure trove. The ordinary business of the ports is conducted in two courts known respectively as the Court of Brotherhood and the Court of Brotherhood and Guestling,—the former being composed of the mayors of the seven principal towns and a number of jurats and freemen from each, and the latter including in addition the mayors, bailiffs, and other representatives of the corporate members. The Court of Brotherhood was formerly called the Brotheryeld, Brodall, or Brodhull; and the name Guestling seems to owe its origin to the fact that the officials of the "members" were at first in the position of invited guests. The highest office in connection with the Cinque Ports is that of the Lord Warden, who also acts as governor of Dover Castle, and has a maritime jurisdiction as admiral of the ports. His power was formerly of great extent, and he held a court of chancery at Dover in the old parish church of St James. He still presides in the court of Shepway, and appoints the justices of peace for the liberties of the Cinque Ports.

See Samuel Jeake, *Charters of the Cinque Ports*, London, small folio, 1728; Philipott's *Villare Cantianum*; the *First Report on Municipal Corporations* in 1835; and the *Census of England and Wales*, 1871, vol. i.

CINTRA, a town of Portugal in the province of Estremadura, 14 miles north-west of Lisbon, with about 4500 inhabitants. It stands at the foot of a rocky mountain of an altitude varying from 1800 to 3000 feet, and is remarkable for the picturesque beauty of its situation and the salubrity of its climate, which render it a favourite resort of the wealthier inhabitants of Lisbon. On one of the adjacent summits stands the Penha Castle, erected by King Ferdinand of Coburg on the site of the former convent of the Hieronymites; and on another are the ruins of a Moorish castle. There is also an ancient royal palace described as a medley of Moorish and Christian architecture, and long famous as the summer residence of the court; and in the neighbourhood is the "Cork Convent" of Santa Cruz, which derives its name from the lining of its cells, and owes its origin to João de Castro, the celebrated viceroy of the Indies, whose heart is still preserved in the chapel of Penha Verde, near the villa in which he resided after his return. The convention by which the French were allowed to leave Portugal without molestation was signed at Cintra, August, 22, 1808.

CIPHER. See CRYPTOGRAPHY.

CIPRIANI, GIOVANNI BATTISTA (1727–1785), painter and draughtsman, was of Pistoian descent, but was born at Florence, where he studied design and colour under Heckford and Gabbiani. After painting several pictures at Pistoia and elsewhere, Cipriani, who had contracted a friendship with Bartolozzi, the eminent engraver, quitted Florence for London. There he worked for the duke of

Richmond and other noblemen and gentlemen, repaired the Rubens ceiling in Whitehall Chapel, and the Verrio frescoes at Windsor, and decorated in part the Royal Academy library. His drawings, which are better than his paintings, engraved by Bartolozzi and his pupils, achieved a wide popularity, and were bought up eagerly all over Europe; but his reputation is nowadays somewhat faded.

CIRCAR is an Indian term applied to the component parts of a *Subah* or province, each of which is administered by a deputy-governor. In English it is principally employed in the name of the Northern Circars, used to designate a now obsolete division of the Madras presidency, which consisted of a narrow slip of territory lying along the western side of the Bay of Bengal from $15^{\circ} 40'$ to $20^{\circ} 17'$ N. lat. These Northern Circars were five in number, Ciccacole, Rajamundry, Ellore, Condapilly, and Guntoor, and their total area was about 30,000 square miles. The district corresponds in the main to that now occupied by the modern divisions of Guntoor, Masulipatam, Rajamundry, Vizagapatam, and Gunjam. It was first invaded by the Mahometans in 1471; in 1541 they conquered Condapilly, and nine years later they extended their conquests over all Guntoor and the districts of Masulipatam. But the invaders appear to have acquired only an imperfect possession of the country, as it was again wrested from the Hindu princes of Orissa about the year 1571, during the reign of Ibrahim Kutub, shah of Hyderabad or Goleondah. In 1687 the Circars were added, along with the empire of Hyderabad, to the extensive empire of Aurungzebe. Salabut Jung, the son of Nizam ul Mulk, who was indebted for his elevation to the throne to the French East India Company, granted them in return for their services the district of Condavir or Guntoor, and soon afterwards the other Circars. In 1759, by the conquest of the fortress of Masulipatam, the dominion of the maritime provinces on both sides, from the River Gondegama to the Chilca Lake, was necessarily transferred from the French to the British. But the latter left them under the administration of the Nizam, with the exception of the town and fortress of Masulipatam, which were retained by the English East India Company. In 1765 Lord Clive obtained from the Mogul a grant of four of the Circars, which in the following year was confirmed by a treaty entered into with Nizam Ali, who had by this time superseded Salabut Jung in his authority. The remaining Circar of Guntoor devolved to the East India Company in 1788.

CIRCASSIA. The name of Circassia is commonly given to the whole of the north-western portion of the Caucæus, including the district between the mountain range and the Black Sea, and extending to the north of the central ridge as far as the River Kuban. In this sense the term is still in use as a geographical appellation, though the Circassians, as a nation, may be regarded as extinct. The region thus defined may be considered as extending from the neighbourhood of Anapa on the Black Sea to the frontiers of Mingrelia, and having a seaboard of about 280 English miles. Throughout this extent the country is almost wholly mountainous,—the great range of the Caucæus, which begins in the neighbourhood of Anapa at a moderate elevation, rising gradually as it extends towards the south-east, till it culminates in the lofty summit of Mount Elbruz, at an elevation of 18,526 feet. The strip of land between the dividing ridge or watershed of these mountains and the sea, a tract varying from twenty to forty miles in width, is extremely rugged, traversed by successive offshoots of the mountains, extending quite down to the sea, and covered for the most part with extensive forests. The slopes on the northern side of the Caucæus are more gentle, and here the valleys afford abundant pasturage, but hardly any portion of Circassia, properly so called, is a level or open country.

The Tcherkesses or Circassians, who gave name to this region, of which they were until lately the sole inhabitants, are a peculiar race, differing from the other tribes of the Caucasus in origin and language. They designate themselves by the name of Adighe, that of Tcherkesses being a term of Russian origin. By their long-continued struggles with the power of Russia, during a period of nearly forty years, they attracted the attention of the other nations of Europe in a high degree, and were at the same time an object of interest to the student of the history of civilization, from the strange mixture which their customs exhibited of chivalrous sentiment with savage customs. For this reason it may be still worth while to give a brief summary of their national characteristics and manners, though these must now be regarded as in great measure things of the past.

In the patriarchal simplicity of their manners, the mental qualities with which they were endowed, the beauty of form and regularity of feature by which they were distinguished, they surpassed most of the other tribes of the Caucasus. At the same time they were remarkable for their warlike and intrepid character, their independence, their hospitality to strangers, and that love of country which they manifested in their determined resistance to an almost overwhelming power during the period of a long and desolating war. The government under which they lived was a peculiar form of the feudal system. The free Circassians were divided into three distinct ranks, the princes or *pschi*, the nobles or *wor* (Tartar *usden*), and the peasants or *hokotl*. Like the inhabitants of the other regions of the Caucasus, they were also divided into numerous families, tribes, or clans, some of which were very powerful, and carried on war against each other with great animosity. The slaves, of whom a large proportion were prisoners of war, were generally employed in the cultivation of the soil, or in the domestic service of some of the principal chiefs.

The will of the people was acknowledged as the supreme source of authority; and every free Circassian had a right to express his opinion in those assemblies of his tribe in which the questions of peace and war, almost the only subjects which engaged their attention, were brought under deliberation. The princes and nobles, the leaders of the people in war and their rulers in peace, were only the administrators of a power which was delegated to them. As they had no written laws, the administration of justice was regulated solely by custom and tradition, and in those tribes professing Mahometanism by the precepts of the Koran. The most aged and respected inhabitants of the various *auls* or villages frequently sat in judgment, and their decisions were received without a murmur by the contending parties. The Circassian princes and nobles were professedly Mahometans; but in their religious services many of the ceremonies of their former heathen and Christian worship were still preserved. A great part of the people had remained faithful to the worship of their ancient gods,—Shible, the god of thunder, of war, and of justice, Tleps, the god of fire, and Seosseres, the god of water and of winds. Although the Circassians are said to have possessed minds capable of the highest cultivation, the arts and sciences, with the exception of poetry and music, were completely neglected. They possessed no written language. The wisdom of their sages, the knowledge they had acquired, and the memory of their warlike deeds were preserved in verses, which were repeated from mouth to mouth and descended from father to son.

The education of the young Circassian was confined to riding, fencing, shooting, hunting, and such exercises as were calculated to strengthen his frame, and prepare him for a life of active warfare. The only intellectual duty of the *atalik*, or instructor with whom the young men lived

until they had completed their education, was that of teaching them to express their thoughts shortly, quickly, and appropriately. One of their marriage ceremonies was very strange. The young man who had been approved by the parents, and had paid the stipulated price in money, horses, oxen, or sheep, for his bride, was expected to come with his friends fully armed, and to carry her off by force from her father's house. Every free Circassian had unlimited right over the lives of his wife and children. Although polygamy was allowed by the laws of the Koran, the custom of the country forbade it, and the Circassians were generally faithful to the marriage bond. The respect for superior age was carried to such an extent, that the young brother used to rise from his seat when the elder entered an apartment, and was silent when he spoke. Like all the other inhabitants of the Caucasus, the Circassians were distinguished for two very opposite qualities, the most generous hospitality, and implacable vindictiveness. Hospitality to the stranger was considered one of the most sacred duties. Whatever were his rank in life, all the members of the family rose to receive him on his entrance, and conduct him to the principal seat in the apartment. The host was considered responsible with his own life for the security of his guest, upon whom, even although his deadliest enemy, he would inflict no injury while under the protection of his roof. The chief who had received a stranger was also bound to grant him an escort of horse to conduct him in safety on his journey, and confide him to the protection of those nobles with whom he might be on friendly terms. The law of vengeance was no less binding on the Circassian. The individual who had slain any member of a family was pursued with implacable vengeance by the relatives, until his crime was expiated by death. The murderer might, indeed, secure his safety by the payment of a certain sum of money, or by carrying off from the house of his enemy a newly-born child, bringing it up as his own, and restoring it when its education was finished. In either case, the family of the slain individual might discontinue the pursuit of vengeance without any stain upon its honour. The man closely followed by his enemy, who, on reaching the dwelling of a woman, had merely touched her hand, was safe from all other pursuit so long as he remained under the protection of her roof. The opinions of the Circassians regarding theft resembled those of the ancient Spartans. The commission of the crime was not considered so disgraceful as its discovery; and the punishment of being compelled publicly to restore the stolen property to its original possessor, amid the derision of his tribe, was much dreaded by the Circassian who would glory in a successful theft. The greatest stain upon the Circassian character was the custom of selling their children, the Circassian father being always willing to part with his daughters, many of whom were bought by Turkish merchants for the harems of Eastern monarchs. But no degradation was implied in this transaction, and the young women themselves were generally willing partners in it. Herds of cattle and sheep constituted the chief riches of the inhabitants. The princes and nobles, from whom the members of the various tribes held the land which they cultivated, were the proprietors of the soil. The Circassians carried on little or no commerce, and the state of perpetual warfare in which they lived prevented them from cultivating any of the arts of peace.

The early history of Circassia is exceedingly obscure. This part of the coasts of the Black Sea was inhabited in ancient times only by wild and barbarous tribes, whose names are very differently given by ancient writers. No Greek colonies were planted within the limits of Circassia proper, though the Greeks carried on an extensive trade with the nations of the interior at Dioscurias, near Sukhum

Kaleh. In the 12th and 13th centuries the princes of Georgia were successful in reducing Circassia into the condition of a province; and are said to have also been the first to introduce Christianity into the country—a religion which they continued to profess (in name at least) till the 18th century, when they were converted to Islamism by the teaching of a fanatical devotee named Mansur. The common people, however, retain to a great extent their pagan customs and beliefs. After they had succeeded in throwing off the Georgian yoke, the Circassians passed for a time under the rule of the Tartar khans of the Crimea, from whom they emancipated themselves, with the assistance of Ivan I., czar of Russia. But the Russian monarchs do not appear to have regarded their conquest as a matter of much importance, until the time of Peter the Great. That powerful monarch, perceiving how much the possession of the Caucasus would contribute to his political and commercial influence in Western and Central Asia, made an unsuccessful attempt to reduce it permanently under his dominion. Catherine II. pursued a similar line of policy. Georgia having been harassed by the successive invasions of the Persians and Turks, the prince of that country at last threw himself under the protection of the Russians, and became tributary to their power. The River Kouban being afterwards fixed as the southern boundary of the Muscovite empire, the Russians became ambitious of extending their dominion uninterruptedly to the extreme limits of Georgia. In the wars which now took place between the Russians and the Turks, the latter used every exertion, by exciting the fanatical feelings of the Circassians against the infidels, to induce them to harass the Russians by frequent incursions into their territory. After various vicissitudes of fortune, the Turks were worsted, and compelled by the treaty of Adrianople in 1829 to cede a considerable portion of their territory to the czar. Assuming a right of political sovereignty which they had never possessed, they included Circassia in this cession. The Circassians, refusing to acknowledge the right of the sultan (whom they had never recognized as their sovereign, though acknowledging him as head of their religion) thus to dispose of their country, were now exposed to the hostility of the Russians, who determined to become masters of the territory on the coasts of the Black Sea, and indeed of the whole Caucasian region, by force of arms. This was the origin of that remorseless war which was carried on with so much animosity down to a very recent period, and cost the Russians an incredible amount of blood and treasure.

A brief outline of the leading events which characterized this long-protracted struggle will be found in the article CAUCASUS. After the Circassians were finally reduced to submission, the inhabitants of the sea-coast, rather than submit to the regulations imposed by the Russian Government, determined to quit their country, and emigrate in a mass to Turkey. Not less than half a million of people carried out this resolution, and were settled in different parts of the Turkish empire,—the greater part of them in Asia Minor, but some also in the mountain country on the borders of Bulgaria and Servia. Since that period the whole tract along the sea-coast from Anapa to Snkhun Kaleh, which was that best known as Circassia, has been almost entirely destitute of inhabitants. But the northern slopes of the Caucasus, and the valleys descending towards the Kuban, are still occupied by tribes of Circassian race; and the Kabardans, a kindred tribe, but of less warlike character, extending eastwards to beyond the Terek, have long settled down quietly in the condition of Russian subjects. (E. H. B.)

CIRCE, in classical mythology, the daughter of Sol and Forse, or of Hyperion and Aërope, or, according to some,

of Æetes, king of Colchis (whom others call her brother), was a famous sorceress. Having murdered her husband, the prince of Colchis, she was expelled by her subjects, and placed by her father on the solitary island of Ææa, on the coast of Italy. Here she was found by Ulysses and his companions; the latter she changed into swine, but the hero, protected by the herb *moly* which he had received from Mercury, not only forced her to restore them, but also gained her love. For a year he relinquished himself to her endearments; but at length he aroused himself, and after descending at her advice to the lower world, to consult the prophet Tiresias as to the fate which awaited him, he left her. The metamorphoses by Circe of Scylla and of Pæus, king of the Ausonians, are celebrated by Ovid.

CIRCEII, a town of ancient Italy, in Latium, at the foot of Mons Circeius, or Capo Circeo, a short distance from the sea, and 10 or 12 miles along the coast from Terracina. It was originally colonized by the Romans in the reign of Tarquin the Proud, who deemed the position favourable for commerce and for repressing the inroads of the Volsci. From its foundation till the date of the Latin War, 340 B.C., it seems at one time to have been subject to the Romans, at another to have espoused the cause of the Volsci, and sometimes to have been independent of both powers. After the Latin War it was recolonized by the Romans; but it continued gradually to decline till the emperors Tiberius and Domitian, attracted to it by the pleasantness of its situation and the excellence of its oysters, erected villas in the neighbourhood. Its ruins are still distinctly visible on the Monte della Cittadella, and consist of walls and gateways built of polygonal blocks.

CIRCUIT, a law term, signifying the periodical progress of a legal tribunal for the sake of carrying out the administration of the law in the several provinces of a country. It has long been applied to the journey or progress which the judges have been in the habit of making twice every year, through the several counties of England, to hold courts and administer justice, where recourse could not be had to the king's court at Westminster. The country, including Wales, is now, by Order in Council (under the Judicature Act, 1875), dated 5th February 1876, divided into seven circuits, viz., the Northern, North-Eastern, Midland, South-Eastern, Oxford, Western, North Wales, and South Wales Circuits. Counsel are not expected to practice on a circuit other than that to which they have attached themselves, unless they receive a special retainer. This and similar regulations are enforced by the discipline of the circuit bar mess only. In Scotland the judges of the supreme criminal court, or High Court of Justiciary, form also three separate circuit-courts, consisting of two judges each; and the country, with the exception of the Lothians, is divided into corresponding districts, called the Northern, Western, and Southern Circuits. In certain burghs of each circuit two courts are held in the year, in spring and autumn, called Circuit Courts. One more is held at Glasgow during the Christmas recess. Ireland is divided into the North-East and the North-West Circuits, the Home Circuit, and those of Leinster, Connaught, and Munster.

CIRCUMCISION. The importance of this rite is so largely due to its quasi-sacramental character in Judaism, that any inquiry into its history and meaning must be prefaced by a reference to the Old Testament.

I. There are three distinct narratives in the sacred literature of the Jews which claim to be considered. It is related in Gen. xvii. that when Abram the Hebrew was ninety-nine years of age, he became a party on behalf of himself and his descendants to a covenant with his God. Of this covenant the sign and condition was circumcision, which was directed to be performed (a peculiarity of Judaism) on

the eighth day after the child's birth. Is this account, we may ask, based on a historical tradition? If so, the circumcision of the Israelites is entirely unconnected with that of other nations unless indeed other nations have borrowed theirs from the Israelites. This has actually been maintained in the case of the Egyptians by Archdeacon Hardwicke, but the theory is not only improbable in itself, considering the imitative character of the Israelites, and their low reputation in Egypt (Gen. xli. 34), but contrary to the evidence of the Egyptian monuments (see below). If, as has been supposed by some, the document to which Gen. xvii. belongs is of post-captivity origin, this would put it out of court as a witness to the popular tradition of the Hebrews. But there is another narrative, apparently of a more archaic complexion, which leads to a directly opposite historical result. We read in Exod. iv. 25, 26, that when Moses was returning from Midian to Egypt, he was in danger of his life, owing to the neglect of the rite of circumcision in his family. "And Zipporah," his Midianitish wife, "took a sharp stone, and cut off the foreskin of her son, and cast it at his feet, and said, Surely a *khathan* (Auth. Vers., 'husband') of blood art thou to me; so he (*sc.*, the offended deity) desisted from him. At that time she said, A *khathan* of blood, with reference to the circumcision." The meaning of this story can still be discerned. *Khathan*, or *khatan*, meant originally not "husband" (as Auth. Vers. of Exodus), nor "son-in-law" (as in ordinary Arabic), but "a newly-admitted member of the family." This appears from the sense of Arab. *khatana*, "to provide a wedding-feast," and *khātana*, "to give or receive a daughter in marriage." So that in the sense of the old Hebrew tradition, "a *khāthan* of blood" meant "one who has become a *khathan*, not by marriage, but by circumcision," a meaning which is still further confirmed by the derived sense of Arab. *khatana* "to circumcise," circumcision being performed in Arabia at the age of puberty. To sum up:—an Arabian woman plays the chief part in the story, and her words are only explicable from the Arabic; it is also far from improbable that Yahweh (or Jehovah) was himself first made known to the Jews in Arabia (comp. Judg. v. 4, Hab. iii. 3); putting all which together, we obtain a strong case for the hypothesis of the Arabian origin of Jewish circumcision.

The third narrative is Josh. v. 2-9, where Joshua is said to have circumcised the children of Israel a second time with "knives of stone," and to have thus "rolled away the reproach of Egypt from off them." It is not unnatural that this should have been used by some to confirm the view of an Egyptian origin of circumcision, among others by Dr Ebers, who refers to the additional words in the Septuagint, Josh. xxiv. 31, "There they buried with him. . . the stone knives with which he had circumcised the children of Israel in Gilgal." But, first, with regard to this singular statement of the Alexandrine version, it must henceforth be abandoned by all scholars. It is simply an unscientific attempt to account for the existence near Joshua's supposed tomb of flint instruments, such as those discovered by M. Guérin on this very site. It need hardly be added that the flint instruments discovered by the French *savant* were really pre-historic; they consist not only of knives, but of saws, which would hardly have been available for the purpose ascribed to Joshua (see Burton and Drake's *Unexplored Syria*, ii. 295-300). And, secondly, Bishop Colenso has shown some reason for the suspicion that verses 2 to 8 (not verse 9) are later additions to the narrative, in which case the "reproach of Egypt" means, not the state of uncircumcision, but the contempt of the Egyptians so forcibly expressed in Exod. xxxii. 12, Num. xiv. 13-16. As for the "knives of stone" (comp. Josh. xxiv. 31, Sept.), on which Ebers

has laid some stress, such implements are not distinctively Egyptian, if they were even employed at all by the Egyptians for the purpose of circumcision. It is true that Herodotus (ii. 104, comp. Diod. Sic., i. 28) asserts the Egyptian origin of circumcision to have been admitted in Palestine, but he is probably only right so far as the Phœnicians or Canaanites are concerned.

II. We may now proceed to consider circumcision from an ethnographical point of view. It was not a specially Semitic rite, being only known to the southern and western Semites, who probably derived it directly or indirectly from the Egyptians, if not from some entirely non-Semitic source. Though not referred to in the Koran, it was a primitive Arabian custom to circumcise youths at their entrance on puberty (*i.e.*, between their tenth and fifteenth year), as appears not only from Gen. xvii. 25, Jos. *Antiq.*, i. 12, 2, but from the express statement of Ibn-al-Athir (quoted by Pococke, *Specimen Hist. Arabum*, p. 319), which is confirmed by a remarkable passage in the life of the old Arabian poet Dhūl-isba (*Zeitschr. f. d. Kunde des Morgenlandes*, iii. 230). From Arabia it was carried by the preachers of Islam to Persia, India, and Turkey; from Arabia, too, as we have seen, it probably came in remote times to the Israelites. The circumcision of the Phœnicians or Canaanites has been disputed, but is attested by Herodotus (ii. 104), and is confirmed by the story in Gen. xxxiv., as also by the fact that the term of contempt, "the uncircumcised," is reserved in the Old Testament for the Philistines. The rite seems, however, to have fallen into disuse in later times in Phœnicia as well as in Egypt (Dr Ebers refers to the uncircumcised figures on the stele of Pianchi, comp. also Herod. *l.c.*, Jos. *Antiq.*, viii. 10, 3, *Contr. Ap.* i. 22, and perhaps Ezek. xxxii. 24, 30), which may partly account for its being afterwards regarded as distinctive of the Jews. The Egyptians, too, were circumcised, and that prior to the immigration of the Hebrews (Wilkinson), as appears from the representations on the very earliest monuments. The most striking of these is the scene on a bas-relief discovered in the temple of Chunsu at Karnak, a drawing of which is given by M. Chabas and Dr Ebers. The subjects of the operation are apparently the two children of Rameses II., the founder of the temple. Their age, says Dr Ebers, must be between six and ten, which agrees with the present custom in Egypt, where, as Mr Lane tells us, circumcision is generally performed in the fifth or sixth year, though often postponed by peasants to the twelfth, thirteenth, or even fourteenth year (*Modern Egyptians*, i. 71). It has often been asserted that only the priests underwent the operation, but there is no earlier evidence for this than that of Origen (ed. Lommatsch, iv. 138), in whose time it is quite possible that the Egyptians, like the later Jews, sought to evade a peculiarity which exposed them to ridicule and contempt.

But the rite of circumcision is known among nations which cannot be suspected of communication with Egypt. Similar causes produce similar effects all the world over. It was in use in some form among the ancient civilized peoples of Central America, though this is better attested of the Nahua branch (including the Aztecs) than of the Maya (Bancroft, *Native Races*, vol. iii.). It is still kept up among the Teamas and Manaos on the Amazon; also among three distinct races in the South Seas, among most of the tribes of Australia, among the Papuans, the New Caledonians, and the inhabitants of the New Hebrides. It is widely spread in Africa, especially among the Kaffir tribes. Among the Bechuanas the boys who are circumcised together form a sort of society, for which among other reasons, Waitz conjectures that the Bechuanas communicated the rite to the other Kaffirs. Prichard (*Physical*

History of Mankind, ii. 287) rightly dismisses the idea that the Kaffirs borrowed the rite from Mahometan nations, though the progress of Islam will help to account for its prevalence in other parts of Africa.

III. Very different views were held in antiquity as to the meaning of the rite of circumcision. There was a myth common to Egypt and Phœnicia, though not of very ancient date in its extant Egyptian form, which seems to bring circumcision into connection with the Sun-god. In the *Book of the Dead*, chap. xvii., we read of "the blood which proceeded from the limb of the god Ra, when he wished to cut himself," which the late Vicomte de Rougé interpreted, with much plausibility, of circumcision (*Revue archéologique*, nouv. série, i. 244). And in a fragment of the Philonian Sanchoniathon (*Fragmenta Historicorum Græcorum*, ed. Müller, iii. 568, 569), we find a similar tale of El circumcising his father Uranos, or, according to another version, himself, and the blood flowing into the springs and rivers. Space forbids us to discuss the bearings of this myth. Herodotus (ii. 37) ascribes the Egyptian custom to the motive of cleanliness (καθαριότητος εἵκεα). This is also one of the four causes reported on the authority of tradition by Philo the Jew (*Opera*, ed. Mangey, ii. 210), the three others being the avoidance of carbuncle, the symbolizing of purity of heart, and the attainment of a numerous offspring. Mere cleanliness, however, seems hardly an adequate motive for the practice. Sanitary reasons seem much more probable, judging from the well-ascertained physical advantages of circumcision to the Jewish race. But even this is not a complete explanation. Why was the practice adopted by some nations and not by others? The most scientific theory is that which refers it to a religious instinct common to all nations, though not always expressing itself in the same way, and this seems even to be at least obscurely indicated by the tradition of the Israelites. The prophet Jeremiah (ix. 25, 26), too, puts it in the same class with cutting off the hair (comp. Herod. iii. 5), which, like other bodily mutilations, has been shown to be of the nature of a representative sacrifice (Tylor's *Primitive Culture*, ii. 363, 364). The principle of substitution was familiar to all ancient nations, and not least to the Israelites. Witness the story of Gen. xxii., the paschal lamb, and the redemption of the first-born by an offering (Exod. xiii. 11-16), and compare the singular phrase ascribed to Saul in 1 Sam. xviii. 25. On this principle circumcision was an economical recognition of the divine ownership of human life, a part of the body being sacrificed to preserve the remainder. But it was more than this; otherwise it would scarcely have asserted its claim to existence among the Jews, when all other mutilations were strictly forbidden as heathenish (Lev. xix. 27, xxi. 5). It can scarcely be doubted that it was a sacrifice to the awful power upon whom the fruit of the womb depended, and having once fixed itself in the minds of the people, neither priest nor prophet could eradicate it. All that these could do was to spiritualize it into a symbol of devotion to a high religious ideal (comp. Jer. iv. 4; Deut. x. 16; Jer. ix. 25).

In conclusion, we must briefly refer to an analogous rite, of which women are in many countries the subjects. It is said to consist in mutilation of the clitoris, which is sometimes connected with the degrading practice of infibulation. It was prevalent in the time of Strabo (pp. 771, 824) in Arabia and in Egypt, and, as Mr Lane attests, is still native to those regions (*Modern Egyptians*, i. 73, *Arabic Lexicon*, s. v. "hafada"). Carsten Niebuhr heard that it was practised on both shores of the Persian Gulf, and at Baghdad (*Description de l'Arabie*, p. 70). It appears in some parts of West Africa, e.g., Dahomey, but is said to be still more common in the eastern part of that continent.

(T. K. C.)

CIRCUS, in Roman Antiquity, was a building for the exhibition of horse and chariot racing. It consisted of tiers of seats running parallel with the sides of the course, and forming a crescent round one of the ends. The other end was straight and at right angles to the course, so that the plan of the whole had nearly the form of an ellipse cut in half at its vertical axis. Along the transverse axis ran a fence (*spina*) separating the return course from the starting one. The straight end had no seats, but was occupied by the stalls (*carceres*) where the chariots and horses were held in readiness. This end constituted also the front of the building with the main entrance. At each end of the course were conical pillars (*metæ*) to mark its limits.

The oldest building of this kind in Rome was the Circus MAXIMUS, in the valley between the Palatine and Aventine hills, where previous to any permanent structure races appear to have been held beside the altar of the god Consus. The first building is assigned to Tarquin the younger, but for a long time little seems to have been done to complete its accommodation, since it is not till 329 B.C. that we hear of stalls being erected for the chariots and horses. It was not in fact till under the empire that the circus became a conspicuous public resort. Cæsar enlarged it to some extent, and also made a canal 10 feet broad between the lowest tier of seats and the course as a precaution for the spectators' safety when exhibitions of fighting with wild beasts, such as were afterwards confined to the amphitheatre, took place. When these exhibitions were removed, and the canal (*euripus*) was no longer necessary, Nero filled it up. Augustus is said to have placed an obelisk between the *metæ* or goals, and to have built a new *pulvinar*, or state box; but if this is taken in connection with the fact that the circus had been partially destroyed by fire in 31 B.C., it may be supposed that besides this he had restored it altogether. Only the lower tiers of seats were of stone, the others being of wood, and this, from the liability to fire, may account for the frequent restorations to which it was subject; it would also explain the falling of the seats by which a crowd of people were killed in the time of Antoninus Pius. In the reign of Claudius, apparently after a fire, the *carceres* of stone (*tufa*) were replaced by marble, and the *metæ* of wood by bronze gilt. Under Domitian, again, after a fire, the circus was rebuilt and the *carceres* increased to 12 instead of 8 as before. The work was finished by Trajan. The number of people it could seat is given at 150,000 and at 250,000, the latter being supposed to be the more correct. This was the only public spectacle at which men and women were not assigned to separate places. The lower seats were reserved for persons of rank; the state box, *suggestus* or *cubiculum*, was midway in the range of seats. The principal object of attraction apart from the racing must have been the *spina* or low wall which ran down the middle of the course, with its obelisks, images, and ornamental shrines. On it also were seven figures of dolphins and seven oval objects, one of which was taken down at every round made in a race, so that spectators might see readily how the contest proceeded. The chariot race consisted of seven rounds of the course. The chariots started abreast, but in an oblique line, so that the outer chariot might be compensated for the wider circle it had to make at the other end. Such a race was called a *missus*, and as many as 24 of these would take place in a day. The competitors

wore different colours, originally white and red (*albata* and *russata*); afterwards the colours green (*prasina*) and blue (*veneta*) were added, and further, under Domitian, gold and purple, but these last two were not long retained. To provide the horses and large staff of attendants, it was necessary to apply to rich capitalists and owners of studs, and from this there grew up in time four select companies (*factiones*) of circus purveyors which were identified with the four colours, and with which those who organized the races had to contract for the proper supply of horses and men. The drivers, who were mostly slaves, were sometimes held in high repute for their skill. The horses most valued were those of Sicily, Spain, and Cappadocia. Chariots with two horses (*bigæ*) or four (*quadrigæ*) were inost common, but sometimes also they had three (*trigæ*) and exceptionally more than four horses. Occasionally there was combined with the chariots a race of riders (*desultores*), each rider having two horses and leaping from one to the other during the race. At certain of the races the proceedings were opened by a *pompa* or procession in which images of the gods and of the imperial family deified were conveyed in cars drawn by horses, mules, or elephants, attended by the colleges of priests, and led by the presiding magistrate seated in a chariot in the dress and with the insignia of a triumphator. The procession passed from the capitol along the forum, and on to the circus, where it was received by the people standing and clapping their hands. The presiding magistrate gave the signal for the races by throwing a white flag (*nappa*) on to the course. Next in importance to the Circus Maximus in Rome was the CIRCUS FLAMINIUS, erected 221 B.C., in the censorship of C. Flaminius, from whom it may have taken its name; or the name may have been derived from Prata Flaminia, where it was situated, and where also were held plebeian meetings. The only games that are positively known to have been celebrated in this circus were the *Ludi Taurii* and *Plebei*. There is no mention of it after the 1st century. Its ruins were identified in the 16th century at S. Caterina de Funari and the Palazzo Mattei. A third circus in Rome was erected by Caligula in the gardens of Agrippina, and was known as the CIRCUS NERONIS, from the notoriety which it obtained through the Circensian pleasures of Nero. A fourth was constructed by Maxentius outside the Porta Appia near the tomb of Cæcilia Metella, where its ruins are still, and now afford the only instance from which an idea of the ancient circi in Rome can be obtained. It was traced to Caracalla, till the discovery of an inscription showed it to be the work of Maxentius. Old topographers speak of six circi, but two of these appear to be imaginary, the Circus Floræ and the Circus Salustii. There remain then the four described above,—C. Maximus, Flaminius, Neronis, and Maxentii.

Circus races were held in connection with the following public festivals, and generally on the last day of the festival if it extended over more than one day:—(1) The *Consualia*, August 21, December 15; (2) *Equivia*, February 27, March 14; (3) *Ludi Romani*, September 4–19; (4) *Ludi Plebei*, November 4–17; (5) *Cerealia*, April 12–19; (6) *Ludi Apollinares*, July 13; (7) *Ludi Megalenses*, April 4–10; (8) *Floralia*, April 28–May 3. (A. S. M.)

CIRENCESTER, or CICESTER, a parliamentary borough and market-town of England, in the county of Gloucester, 16 miles south-east of the town of that name, and 88 miles by road and 95 by the Great Western Railway from London. It returns one member to Parliament, and is a polling-place for East Gloucestershire. Not being incorporated, it is governed by two high constables and 14 wardsmen, elected annually. Cirencester was created a separate hundred by a charter granted in the reign of Henry IV. The town, which is situated on the River

Churn, and is in connection with a branch of the Thames and Severn Canal, has four principal streets, and contains a free grammar-school, alms-houses, a savings bank, a museum, a public library, breweries, and a carpet factory. The church is a fine structure of the 15th century, with an embattled tower 134 feet high, a fine decorated porch, and several lateral chapels. The Royal Agricultural College, which adjoins Oakley Park, the seat of Lord Bathurst, is about a mile and a half from the town. It is a handsome

Arms of Cirencester.

edifice, with a frontage of 190 feet, facing North Wiltshire. Its buildings include a chapel, a dining hall, a library, a lecture theatre, laboratories, class-rooms, private studies and dormitories for the students, apartments for resident professors, and servants' offices; also a museum containing a collection of anatomical and pathological preparations, and mineralogical, botanical, and geological specimens. The college farm comprises 500 acres, 450 of which are arable; and on it are the well-appointed farm-buildings and the veterinary hospital. Besides agriculture, the course of instruction at the college includes chemistry, natural and mechanical philosophy, natural history, mensuration, surveying, and drawing, and other subjects of practical importance to the farmer, proficiency in which is tested by means of sessional examinations. There is some manufacture of carpets, woollen cloths, and curriers' knives, but the industries of Cirencester are chiefly agricultural. It has now a chamber for the promotion of agriculture, and the market is accounted one of the best for live-stock in the west of England. In 1871 the population of the borough, which, including the parish of Stratton, has an area of 5985 acres, amounted to 7681; that of the parish was 7079.

Cirencester occupies the site of Corinum, Corinium, or Durocornovium, the capital of the Dobunni, and an important military station of the Romans, situated at the junction of the Fosse-way with the Ermin and Icknield streets. In 577 it was taken by Ceawlin, king of Wessex, and in 878 by the Danes; and it was the seat of a council held by Canute about the year 1020. An abbey for Black Canons, relics of which still exist, was founded here by Henry I. in 1117. The town was garrisoned for the Parliament at the commencement of the Civil War, and was taken by Rupert in 1642; but in 1643 it was finally surrendered to Cromwell's forces. Numerous Roman antiquities have from time to time been discovered at Cirencester, and remains of the ancient walls, two miles in circuit, and of a Roman amphitheatre are still to be seen there. (See *All the Year Round*, No. 494, Oct. 10, 1868.)

CIRILLO, DOMENICO (1734–1799), physician and patriot, was born at Grugno in the kingdom of Naples. Elected while yet a young man to the botanical chair left vacant by the death of Pedillo, Cirillo went some years afterwards to England, where he was made member of the Royal Society, and to France, where he became the friend of Buffon, Diderot, D'Alembert, and others of like mark. On his return to Naples he was appointed successively to the chairs of practical and theoretical medicine. He wrote voluminously and well on scientific subjects; and he secured an extensive medical practice. The entry into Naples of the French under Championnet, and the proclamation of the Parthenopean Republic (1799), brought to a conclusion his life of laborious and thoughtful benevolence. Cirillo was chosen a representative of the people; he then became a member of the Legislative Commission, and was elected its president. On the abandonment by the French of the young republic (June 1799), cardinal-general Ruffo and the army of Ferdinand of Bourbon returned to Naples, and the republicans withdrew, ill-armed and inadequately provisioned, to the forts. After a short siege, in which an English squadron under Captain Foote bore a prominent part, they surrendered, on honourable terms. Life and

liberty were guaranteed them by the signatures of Ruffo, of Foote, and of Mieberonxa, the Russian minister. But the arrival of Nelson changed the complexion of affairs; he refused to ratify the capitulation. Secure under the British flag, too, Ferdinand and Caroline of Austria showed themselves eager for revenge. The patriots were arrested; and Cirillo, who had tended the queen more than once, and whose skill had been employed on behalf of the English admiral himself, was thrown into prison with the others. A court was formed to try the captives, and Cirillo was brought before them. Neither his age, nor his fair life and fame, nor his heroic speech and bearing, availed with them, and he was condemned to death. Nelson attempted to save him, and Ferdinand consented to forego his vengeance if the republican would ask for mercy. He refused, and was hanged. Cirillo, whose favourite study was botany, and who was recognized as an entomologist by Linnæus, left many books, in Latin and Italian, all of them treating of medical and scientific subjects, and all of little value now save as indications of the writer's fine qualities as a man of science and humanitarian. Exception must, however, be made in favour of the *Virtù Morali dell' Asino*, a pleasant philosophical opuscle remarkable for its double charm of sense and style.

CIRTA, an ancient city of Numidia, in Africa, in the country of the Massyli. It was regarded by the Romans as the strongest position in Numidia, and was made by them the converging point of all their great military roads in that country. By the early emperors it was allowed to fall into decay, but was afterwards restored by Constantine, from whom it took its modern name. See CONSTANTINE.

CIS-SUTLEJ STATES. This term has for many years been obsolete, as inapplicable to modern territorial arrangements. It came into use in 1809, when the Sikh chiefs south of the Sutlej (Satlaj) passed under British protection, and was generally applied to the country south of the Sutlej and north of the Delhi territory, bounded on the E. by the Himalayas, and on the W. by Soisá District. Prior to 1846, the greater part of this territory was independent, the chiefs being subject merely to control from a political officer stationed at Ambálá, and styled the agent of the governor-general for the Cis-Sutlej States. After the first Sikh war the full administration of the territory became vested in the officer already mentioned. In 1849 occurred the annexation of the Punjab, when the Cis-Sutlej States Commissionership, comprising the districts of Ambálá, Ferozpur, Ludhiáná, Thanésvár, and Simla, was incorporated with the new province. The name continued to be applied to this division until 1862, when, owing to Ferozpur having been transferred to the Lahore, and a part of Thanésvár to the Delhi Division, it ceased to be appropriate. Since then, the tract remaining has been known as the Ambálá or Umballa Division. Those of old Cis-Sutlej States which still retain their independence are Gatiálá, Jhino, Nábhá, Maler Kotlá, and Faridkot.

CISTERCIANS, a religious order of the rule of St Benedict, founded in 1098, by St Robert abbot of Molesme. It was so named from its original convent in the forest of Citeaux (Cistercium), about 14 miles north-east of Beaune. This order became so powerful that it governed almost all Europe both in temporal and spiritual concerns, and through the exertions of St Bernard of Clairvaux had increased so rapidly in power, that within a century from its foundation it embraced 800 rich abbeys in different countries of Europe. The abbeys of La Ferté, Pontigny, Clairvaux, and Morimond were offshoots of that of Citeaux, and produced in their turn a great number of separate communities, all which continued under the superintendence of the abbey of Citeaux. The abbey of Morimond alone possessed 700 benefices;

and its supremacy was acknowledged by the military orders of Calatrava, Alcantara, and Montesa in Spain, and by those of Christ and of Avis in Portugal. But the most famous of all the communities of this order was that of Clairvaux, founded in 1115 by St Bernard (see BERNARD). Towards the end of the 12th century, however, the immense wealth of Citeaux began to operate unfavourably on its discipline, and led the way to great corruptions. Jean de la Barrière, abbot of Nôtre-Dame des Feuillants, near Toulouse, succeeded in 1577 in effecting a reform, which gave rise to the Feuillants in France, and likewise to the Reformed Bernardines in Italy. But of all the reforms among the Cistercians, the most celebrated was that effected by the abbot of La Trappe in 1664.

Dependent on the abbey of Citeaux there were about 1800 monasteries and an equal number of nunneries. This ancient abbey was the burial-place of all the dukes of Burgundy of the original line, with the exception of the first two, who died before its foundation.

The Cistercians were involved in the general fate of the religious orders during the period of the French Revolution of 1789, and were reduced to a few convents in Spain, Poland, Austria, and the Saxon part of Upper Lusatia.

The habit of the order is a white robe or cassock, with a black scapulary and a woollen girdle. The nuns wear a white tunic and a black scapulary and girdle.

The order began by exercising more austerity than either the Benedictines of that period (the 11th century) or the Cluniac monks who had emerged from the Benedictine order two centuries earlier. This austerity was exhibited, not only in the rude and scanty fare of the brethren (limited during a great part of the year to one meal a day) and in the great amount of silence imposed, but likewise in the dress, the sacred vestments, and the church furniture of the order. The Cluniac monks not only possessed fine churches, but were also in the habit of adorning them with pictures, jewelled crosses, and other elaborate decorations, while their vestments and chalice were in keeping with this splendour. Indeed one of their first men, St Hugh, a contemporary of St Bernard, strongly maintained the principle that nothing could be too rich and costly for the divine service. But St Stephen Harding, the English monk, who, though only the second abbot, was the virtual creator of Cistercian rule and discipline, impressed on the Cistercian mind a different principle, and trained up St Bernard in it. Their chasubles were to be only of linen, the chalice not of gold but of silver gilt, and even the white robe of the order was less voluminous in its folds than that of the Cluniac brethren. In one respect, however, the sense of beauty seems to have been allowed to operate. Although the material was to be coarse, yet the form of a vestment might be carefully looked to; and this taste for beauty of form led in due time to great advances in the architecture of their buildings. This difference between the Cistercians and the Cluniacs occasioned considerable rivalry and even bitterness of sentiment,—the Cistercians being in danger of something like Pharisaic pride in contrasting their own severer rule with the comparative luxury of their neighbours the Cluniacs, who apparently afforded some ground for the charge of relaxation of discipline, especially in the 12th century after the death of St Hugh.

In the matter of government, the Cistercian order (as constituted by St Stephen Harding at a general chapter held in 1119) differed both from the Benedictine and from the Cluniac constitutions. According to the rule of St Benedict each monastery was to be an independent monarchy under its own abbot; although in extraordinary cases neighbouring monasteries of the order might interfere in the election of an abbot. This independence had not been

found to work well, and the Cluniac rule made each daughter monastery to be subject to Cluny, and to receive its prior from his appointment. Such subordination tended to greater regularity of discipline, and greatly increased the power of the order, especially when abbeys were assailed by laymen or unduly harassed by bishops. The abbot of Cluny became a veritable prince with 314 monasteries subject to him, and with the right of coining money, which was accepted as readily as that of the king of France. But its concentration of power in a single hand involved the risk attendant upon all such despotisms; and the Abbot Pontius, who had succeeded St Hugh about 1109 seems to have endangered the entire system by an extravagance which loaded Cluny with debt, and by his ambition in claiming the title of Abbot of Abbots, and in endeavouring to sway the oldest Benedictine house itself, the famous abbey of Monte Casino. St Stephen Harding framed a constitution for the Cistercians which aimed at combining the excellencies without the defects of the two systems. Although in his rule the abbot of Cîteaux was to be recognized as the *Pater Universalis Ordinis*, yet a system of reciprocal visitation was to be carried on, and the four earliest houses which derived their origin from Cîteaux—La Ferté, Pontigny, Clairvaux, and Morimond—governed the abbeys which had respectively sprung from them. The four abbots of these eldest daughters of Cîteaux might even in an extreme case, with the consent of a general chapter, depose the head of the order, the abbot of Cîteaux. This constitution, known as the Chart of Charity, exercised much influence upon other orders, and in some degree upon that of Cluny. But it gave rise to a claim which (though not intended by its author, and denounced by its greatest *alumnus*, St Bernard) was successfully urged in after years by the Cistercian, as well as by other orders, viz., an exemption from episcopal superintendence.

With respect to intellectual culture and influence, the Cistercian order cannot claim a place in the front rank among the monastic bodies. Devoted to worship, to penance, to contemplation, and to culture of the soil, the order did not, like some others, admit the relaxation of scholastic disputations. No doubt it received learned men into its fold. It is also true that St Stephen Harding, with some of his brethren, undertook a revision of the Bible, that copies of many valuable works were made by the brethren (though, with less ornamentation than the illuminated MSS. of some other orders), and that St Bernard was solicitous to furnish all the monasteries founded by himself with good libraries. Nevertheless, as an order, the Cistercians have not achieved such triumphs of learning as the Benedictines, the Dominicans, or the Jesuits.

But no order springing out from the Benedictine proved so popular as the Cistercian. During the 11th century its houses were multiplied in every direction. It touched both ends of the social scale. St Bernard and the thirty novices who joined with him were all of noble birth; many similar accessions were made from time to time, and in the 12th century we read of fifteen young German princes entering the order. But a place was also found for the poor and uneducated. Such as could not be choir brethren, might be lay brethren and till the fields; and the contrast between a labourer of this sort, partaking of the dignity of a great and powerful community, and the neighbouring husbandman, the serf of some feudal lord, was in the eyes of many all in favour of the monk. It may have tended towards that emancipation of the labourers so largely effected by the monastic orders and celebrated in a well-known sonnet by Wordsworth.

The order seems to have especially thriven in England. From Waverley in Surrey, the earliest Cistercian settle-

ment in the country, they spread over Britain, especially by the rivers of Yorkshire, and extended into Scotland.

The overthrow of the Cistercian houses at the time of the Reformation is a part of general monastic history. While some of the dissolutions were unjust, and the execution of abbots mere judicial murders, the luxury of the great Yorkshire houses seems quite undeniable, and perhaps their overthrow may, on the whole, be thought to favour the *dictum* of Mr Carlyle,—that nothing is crushed from without, until it is ripe to perish from within.

For authorities see the articles already referred to. See also Manriquez, *Annales Cistercienses*, 4 vols. folio, Lyons, 1642, and the various biographies of St Bernard by Alban Butler, Neander, De Ratisbon, Morrison, and others; and *The Cistercian Saints of England*, especially *St Stephen Harding*, edited by John Henry Newman, London, 1844. Dean Milman cautions his readers against the love of legend displayed in these biographies, but praises "their research and exquisite charm of style," *Lat. Christianity*, bk. viii. chap. 4. See also Cheruel, *Dictionnaire Historique*, Paris, 1855; and for the artistic elements, so far as regards paintings, Mrs Jamieson's *Legends of the Monastic Orders*, London, 1850; also Cosmo Innes's *Scotland in the Middle Ages*, Edinburgh, 1860; *Records of the Monastery of Kinloss*, by John Stuart, LL.D., Edinburgh, 1872; and an article "Cistercian Abbeys in Yorkshire" in *Fraser's Magazine* for September 1876. (J. G. C.)

CITEAUX, or CISTEAUX, a village in France, in the department of Côte d'Or, about 7 miles east of the town of Nuits, and 12 from Dijon. It is celebrated for the great abbey founded by Robert de Molesme in 1098, which became the head-quarters of the Cistercian order (see last article). The buildings are now occupied as a reformatory for juvenile criminals; and in the neighbourhood is an extensive agricultural college.

CITHÆRON, or as it is now called from its pine forests, ELATEA, a famous mountain, or rather mountain range, in the south of Bœotia, separating that state from Megaris and Attica. It was greatly celebrated in Grecian mythology, and is frequently mentioned by the great poets of Greece, especially by Sophocles. It was on Cithæron that Actæon was changed into a stag, that Pentheus was torn to pieces by the Bacchantes whose orgies he had been watching, and that the infant Œdipus was exposed. This mountain, too, was the scene of the mystic rites of Dionysus; and the festival of the Dædala in honour of Juno was celebrated on its summit. The carriage road from Athens to Thebes crosses the range by a picturesque defile which has at one time been guarded on the Attic side by a strong fortress, the ruins of which are known as Ghyphtho-kastro or Gipsy Castle.

CITRIC ACID, or OXYTRICARBALLYLIC ACID, $C_6H_8O_7$ or $C_3H_4(OH)(CO.OH)_3$, a tetrahydric tribasic acid, first prepared in the solid state by Scheele, in 1784, from the juice of lemons, in which it exists in large quantity. It is present also in oranges, citrons, currants, gooseberries, and many other fruits, and in several bulbs and tubers. It is made on a large scale from lime or lemon juice, chiefly in the months of November and December. The juice is fermented for some time to free it from mucilage, then boiled and filtered, and neutralized with powdered chalk and a little milk of lime; the precipitate of calcium citrate so obtained is decomposed with dilute sulphuric acid, and the resulting solution of citric acid is separated by filtration, evaporated to remove calcium sulphate, and concentrated. The concentration is best effected in vacuum pans. The acid is thus procured in colourless rhombic prisms of the composition $C_6H_8O_7 + H_2O$. Crystals of a different form are deposited from a strong boiling solution of the acid. About 20 gallons of lemon juice should yield about 10 lb of crystallized citric acid. The acid may also be prepared from the juice of unripe gooseberries. Calcium citrate for exportation in the place of lemon juice must be manu-

factured with care to avoid an excess of chalk or lime, which would precipitate constituents of the juice that cause the fermentation of the citrate and the production of calcium acetate and butyrate.

Citric acid has an agreeable sour taste. It is soluble in 1/2 lbs of its weight of cold, and in half its weight of boiling water, and dissolves in alcohol, but not in ether. At 150° C. it melts, and on the continued application of heat boils, giving off its water of crystallization. At 175° C. it is resolved into water and aconitic acid, $C_6H_6O_6$, a substance found in *Equisetum fluviatile*, monkshood, and other plants. A higher temperature decomposes this body into carbonic anhydride and itaconic acid, $C_5H_4O_4$, which, again, by the expulsion of a molecule of water, yields citraconic anhydride, $C_5H_4O_3$. Citric acid digested at a temperature below 40° C. with concentrated sulphuric acid gives off carbonic oxide. With fused potash it forms potassium oxalate and acetate. It is a strong acid, and dissolved in water decomposes the carbonates and attacks iron and zinc. Citric acid, in common with other tribasic acids, evolves about three times the amount of heat disengaged by acetic acid when quantities of these two bodies in the proportion of their molecular weights are saturated with soda,—one molecule of the tribasic being equivalent to three of the monobasic acid.

The citrates are a numerous class of salts, the most soluble of which are those with alkaline bases; the alkaline earthy citrates are insoluble. Citric acid, being tribasic, forms either acid monometallic, acid dimetallic, or neutral trimetallic salts; thus, mono-, di-, and tri-potassic and sodic citrates are known. In a few salts a fourth atom of hydrogen is replaced by a metal, and citric acid is therefore considered by some chemists to be tetrabasic. Citric acid gives with excess of lime-water a slight precipitate of calcium citrate; a further precipitate is produced by boiling, but it is redissolved as the liquid cools. Solution of citric acid may be approximately titrated by means of baryta-water and litmus.

The impurities occasionally present in citric acid are salts of potassium and sodium, traces of iron, lead, and copper derived from the vessels used for its evaporation and crystallization, and free sulphuric, tartaric, and even oxalic acid. Tartaric acid, which is sometimes present in large quantities as an adulterant in commercial citric acid, may be detected in the presence of the latter, by the production of a precipitate of acid potassium tartrate when potassium acetate is added to a cold solution of the sample of acid to be tested. Another mode of separating the two acids is to convert them into calcium salts, which are then treated with a perfectly neutral solution of cupric chloride, soluble cupric citrate and calcium chloride being formed, while cupric tartrate remains undissolved. Citric is furthermore distinguished from tartaric acid by the fact that an ammonia solution of silver tartrate produces a brilliant silver mirror when boiled, whereas citric of silver is reduced only after prolonged ebullition.

Citric acid is used in calico-printing, also in the preparation of effervescing draughts, and occasionally as a refrigerant and antiscorbutic, instead of fresh lemon juice, to which, however, it is therapeutically inferior. In the form of lime juice it has long been known as an antidote for scurvy, and several of the citrates are much employed as medicines.

CITRON, a species of Citrus (*C. medica*, Risso), belonging to the Natural Order *Aurantiaceæ*, which furnishes also the orange, lime, and shaddock. The citron-tree is an evergreen growing to a height of about 8 feet; it has long, pendent, and, in the wild varieties, spiny branches, pale-green, oblong, and sub-serrate leaves, and flowers purple without and white within. The fruit is ovate or oblong, protuberant at the tip, and from 5 to 6 inches

long, with a rough, furrowed, adherent rind, the inner portion of which is thick, white, and fleshy, the outer, thin, greenish-yellow, and very fragrant. The pulp is sub-acid and edible, and its seeds are bitter. There are many varieties of the fruit, some of them of great weight and size. The Madras citron has the form of an oblate sphere; and in the "fingered citron" of China, the lobes are separated into finger-like divisions.

Gallesio and De Candolle consider citrons and lemons to be distinct species; but the former authority states that seed produced by lemon-trees growing amongst citron-trees gave varieties which were intermediate between the two species; and by some botanists citrons, lemons, and oranges are held to be all varieties of the wild *Citrus medica*. According to Dr G. Birdwood, however, the orange and lemon are both natives of Upper India, the former being derived from the wild *Citrus Aurantium* of Gurhwal, Sikkim, and Khasia, and the lemon, lime, and probably citron also, from the wild *Citrus Limonum* of the valleys of Sikkim and Kumaon, of which the *Citrus medica* was the first cultivated variety (*Athenæum*, No. 2544, July 29, 1876, p. 151).

The citron-tree thrives in the open air in China, Persia, the West Indies, Madeira, Sicily, Corsica, and the warmer parts of Spain and Italy; and in conservatories it is often to be seen in more northerly regions. It was described by Theophrastus as growing in Media; it appears, however, not to be indigenous to Persia, but to have been introduced into that country and other lands from North India, where it was found growing wild by Dr Royle. It was early known to the ancients, and the fruit was held in great esteem by them; but they seem to have been acquainted with no other member of the *Aurantiaceæ*, the introduction of oranges and lemons into the countries of the Mediterranean being due to the Arabs, between the 10th and 15th centuries. Josephus tells us that "the law of the Jews required, that at the feast of tabernacles every one should have branches of palm-tree and citron-tree" (*Antiq.*, xiii. 13, 5); and the Hebrew word *tappuch*, rendered "apples" and "apple-tree" in Cant. ii. 3, 5, Prov. xxv. 11, &c., probably signifies the citron-tree and its fruit. Oribasius in the 4th century describes the fruit, accurately distinguishing the three parts of it. About the 3d century the tree was introduced into Italy; and, as Gallesio informs us, it was much grown at Salerno in the 11th century. In China, citrons are placed in apartments to make them fragrant. The rind of the citron yields two perfumes, oil of cedar and oil of citron, isomeric with oil of turpentine; and when preserved it is much esteemed as a sweetmeat.

Oribasii Sardiani *Collectorum Medicinalium Libri XVII.*, l. i. c. 64 (*De citrio*); Gallesio, *Traité du Citrus* (1811); Darwin, *Animals and Plants under Domestication*, vol. i. pp. 334-6 (1868); Brandis, *Forest Flora of North-West and Central India*, p. 61 (1874).

CITTÀ DELLA PIEVE, a town of Italy, in the province of Umbria and district of Orvieto, about six miles from the station of Chiusi on the railway between Siena and Rome. It was the birthplace of Pietro Perugino, and still preserves some of his finest works. Of these several are to be found in the cathedral, and his fresco of the adoration of the Magi adorns the oratory of the Disciplinati. Population, 6500.

CITTÀ DI CASTELLO, a town of Italy, pleasantly situated on the left bank of the Tiber, in the province of Perugia, 25 miles N. by W. from the town of that name. It has a cathedral, dedicated to St Florinus and dating from 1503, a large number of interesting churches with valuable paintings, a communal palace of the 13th century, an episcopal palace remodelled since 1789, and no fewer than four mansions belonging to the Vitelli family, who governed the town in the 15th century, and were among the first to

patronize the youthful Raphael. The city for a long time numbered several works of this artist among its most precious possessions; but they have all been removed except two of minor importance. Città di Castello occupies the site of the ancient *Tiferium Tiberinum*, which was chiefly famous for its connection with the younger Pliny, who had a villa in the neighbourhood. The older city was destroyed by Totila, but numerous inscriptions have been discovered which prove its identity. Population, 6090.

CITTÀ VECCHIA, or CITTÀ NOTABILE, a fortified city of Malta, situated about six miles west of Valetta, on high ground which affords a view of a large part of the island. It is the seat of a bishop, and contains an episcopal seminary and a handsome modern cathedral, which is said by tradition to occupy the site of the house of the governor Publius, who welcomed the apostle Paul. In the rock beneath the city there are some remarkable catacombs; and a grotto, reputed to have given shelter to the apostle, is pointed out below the church of S. Paolo. About two miles from the town is the residence of the English governor, known as the palace of St Antonio; and at a like distance in another direction is the ancient palace of the grand-masters of the order of St John, with an extensive public garden called Il Boschetto. Città Vecchia was called Medina, or the City, by the Arabs, and it probably represents the town of *Melita*, which is mentioned by all the ancient geographers. It continued to be the capital of the island till the rise of Valetta in the 16th century. Population about 7000.

CITY. This word, derived through the French *cité* from the Latin *civitas*, is used in England with considerable laxity as little more than a synonym for town; while at the same time there is a kind of traditional feeling of dignity connected with it. It was maintained by Coke and Blackstone that a city is a town incorporate which is or has been the see of a bishop; and this opinion has been very generally adopted since. It does not correspond, however, with actual English usage; for Westminster, on the one hand, is called a city though it has no corporation; and Thetford, Sherbourne, and Dorchester are never so designated though they are regularly incorporated and were once episcopal sees. It is true, indeed, that the actual sees in the country all have a formal right to the title, and that Westminster is the only place without a bishop that has the same claim. In the United States, where the ecclesiastical distinction does not exist, the application of the term depends on the kind and extent of the municipal privileges possessed by the corporations, and charters are given raising from the rank of town to that of city. This use of the word is much more in keeping with its derivation, which leads the mind back to the idea of the social life and corporate action of a body of freemen; and it also agrees better with such classical English phrases as "a free city," an imperial city. Both in France and in England the word is popularly used to distinguish the older and central nucleus of some of the larger towns such as London and Paris. The history of the rise of cities and towns has been given in the article BOROUGH.

CIUDAD BOLIVAR. See ANGOSTURA.

CIUDAD REAL, the chief town formerly of La Mancha, and now of the province of Ciudad Real, in Spain, 97 miles south from Madrid, on a plain between the Jabalon and Guadiana. It was built and fortified by Alphonso the Wise in 1264, to check the progress of the Moors; and portions of the walls and towers remain. It has several fine churches, and a large hospital, founded by Cardinal Lorenzana. It is one of the least commercial of the larger towns of Spain, deriving most of its trade from agriculture and an annual fair which is of great importance for the sale of asses and mules. Population, 9000.

CIUDAD REAL, the chief town of the state of Chiapas in Mexico, otherwise known as SAN CRISTOBAL (*q. v.*)

CIUDAD RODRIGO, a town of Spain, on the Agueda, in the province of Salamanca, near the frontier of Portugal. It is fortified, and has some good public buildings, including a cathedral (built in 1190), several churches and convents, an arena for bull-fights, and an episcopal seminary. In the principal square are three Roman columns brought from the ancient Malabriga; and remains of a Roman aqueduct are also extant. A bridge connects the city with the suburbs, which are surrounded by a fertile and well-cultivated district. There are manufactures of woollen stuffs, leather, and linen; and the soap is celebrated in Spain as *Jabon de Piedra*. During the Peninsular war the town was taken by Marshal Masséna in 1810, and in 1812 by the duke of Wellington, who received from the Cortes the title of duke of Ciudad Rodrigo. Population, 5700.

CIUDADELA, a city, formerly the capital of Minorca, at the head of a deep and narrow bay on its west coast, 25 miles north-west of Mahon. It is surrounded by walls, and has a fine Gothic church. Population upwards of 5000.

CIVET (*Viverra*), a genus of Carnivorous Mammals forming with the genet and ichneumon the family *Viverridae*, and characterized by the possession of a deep pouch situated in the neighbourhood of the genital organs (divided into two sacs each about the size of an almond), into which the substance known as civet is poured from the glandular follicles secreting it. This fatty substance is at first semifluid and of a yellow colour, but afterwards acquires the consistency of pomade and becomes darker. It has a strong musky odour, exceedingly disagreeable to those unaccustomed to it, but "when properly diluted and combined with other scents it produces a very pleasing effect, and possesses a much more floral fragrance than musk, indeed it would be impossible to imitate some flowers without it" (Rimmel's *Art of Perfumery*). There are three species of civet-producing *Viverridae*. The Civet (*Viverra civetta*) is a native of North Africa and extends as far south and west as Fernando Po. It is from 2 to 3 feet in length, exclusive of the tail, which is half the length of the body, and stands from 10 to 12 inches high. It is covered with long hair, that on the middle line of the back being longest and capable of being raised or depressed at will, of a dark-grey colour, with numerous transverse black bands and spots. It is chiefly nocturnal, and is by preference carnivorous, feeding on birds and the smaller quadrupeds, in pursuit of which it climbs trees, but it is said also to eat fruits, roots, and other vegetable matters. In a state of captivity it is never completely tamed, and is only thus kept for the sake of the civet, which is obtained in largest quantity from the male, especially when he is in good condition and is subjected to irritation. It is scraped from the pouch with a small spoon usually twice a week. The Zibeth (*Viverra zibetha*) is a widely distributed species extending from Arabia to Malabar, and throughout several of the larger islands of the Indian Archipelago. It is smaller than the civet, and wants the dorsal crest. In the wild state it is exceedingly ferocious, doing great damage among poultry, and frequently making off with the young of the swine and sheep. "To the rapacity of the wolf," says Captain Williamson, "it joins the agility of the cat and the cunning of the fox." When hunted it makes a determined resistance, and emits a scent so strong as even to sicken the dogs, who nevertheless are exceedingly fond of the sport, and cannot be got to pursue any other game while the stench of the zibeth is in their nostrils. In confinement, however, it becomes comparatively tame, and civet is obtained from it in considerable quantity. In preparing this for the market it is usually spread out on the leaves of the pepper plant in order to free it from the

hairs that have become detached from the pouch. The Rasse (*Viverra rasse*) is the fiercest and most carnivorous of its kind, and remains untamed in confinement. It is a native of Java, where it is found not unfrequently in forests at a moderate elevation above the sea level. It is almost 3 feet long including the tail, and is prettily marked with dark longitudinal stripes, and with spots which have a distinctly linear arrangement. Its perfume, which is extracted in the same way as in the two preceding species, is highly valued and much used by the Javanese, who, according to Dr Horsfield, apply it to their dresses, and by means of various unguents and mixtures of flowers to their persons. British imports of civet are chiefly from the Indian Archipelago, and when pure it is worth about £2 per ounce. It is frequently adulterated with butter or lard. Fossil remains of extinct civets are found in the Miocene strata of Europe.

CIVIDALE, or more precisely CIVIDALE DEL FRIULI, a town of Italy, in the province of Udine, and about ten miles east of the city of that name, on the right bank of the Natisone, over which there is a bridge 250 feet in length. It has an interesting collegiate church founded in 750, an antiquarian museum, and a military training college. The archives of the "duomo" contain various manuscripts of value, among which may be mentioned a 5th century copy of the translation of the Gospels by St Jerome, and the prayer-book of St Gertrude which dates from the 11th century. Cividale is generally supposed to occupy the site of the ancient *Forum Julii*, a town of the Carni, which rose to the rank of a Roman colony, became the capital of Venetia after the destruction of Aquileia in 452, was made the seat of a duchy under the Lombards, and thus gave its name to the province of Friuli. Many ancient remains have been brought to light from time to time, including vases, bas-reliefs, inscriptions, a temple, and another large building with mosaic floors. In 1874 the tomb of the Lombard duke Gisulfo was discovered. Paulus Diaconus was born at Forum Julii in the 8th century; and the actress Ristori is a native of Cividale. Population, 8200.

CIVIL LAW. This phrase, and its Latin equivalent *jus civile*, have been used in a great variety of meanings. *Jus civile* was sometimes used to distinguish that portion of the Roman law which was the proper or ancient law of the city or state of Rome from the *jus gentium*, or the law common to all the nations comprising the Roman world, which was incorporated with the former through the agency of the prætorian edicts. This historical distinction remained as a permanent principle of division in the body of the Roman law. One of the first propositions of the Institutes of Justinian is the following:—"Jus autem civile vel gentium ita dividitur. Omnes populi qui legibus et moribus reguntur partim suo proprio, partim communi omnium hominum jure utuntur; nam quod quisque populus ipsi sibi jus constituit, id ipsius civitatis proprium est, vocaturque jus civile quasi jus proprium ipsius civitatis. Quod vero naturalis ratio inter omnes homines constituit, id apud omnes præque custoditur, vocaturque jus gentium quasi quo jure omnes gentes utuntur." The *jus gentium* of this passage is elsewhere identified with *jus naturale*, so that the distinction comes to be one between civil law and natural or divine law. The municipal or private law of a state is sometimes described as civil law in distinction to public or international law. Again the municipal law of a state may be divided into civil law and criminal law. The phrase, however, is applied *par excellence* to the system of law created by the genius of the Roman people, and handed down by them to the nations of the modern world. The civil law in this sense would be distinguished from the local or national law of modern states. In England recent changes have reduced the number of courts in which the

principles of the civil law are recognized, but we are still accustomed to say that the civil law has a certain limited application, and that the race of civilians or civil lawyers is not quite extinct. The civil law in this sense is further to be distinguished from that adaptation of its principles to ecclesiastical purposes which is known as the canon law. See ROMAN LAW.

CIVITA CASTELLANA, a town of Italy, in the province of Rome, 17 miles E.S.E. of Viterbo, situated on a volcanic plateau surrounded on all sides but one by deep ravines which send down their streamlets to the Tiber. The road from Borghetto crosses the gorge by a magnificent bridge erected in 1712 by Cardinal Imperiali. The town is a bishop's see, and has a cathedral dating from 1210, with beautiful mosaics and an interesting crypt adorned by an altar-piece of the 14th century. The citadel, which was founded by Alexander VI. and completed by Leo X., is used for the incarceration of state prisoners. In the neighbourhood are the remains of the ancient city of *Falerium Vetus*, well known in connection with the story of Camillus and the schoolmaster; portions of the ancient walls, gateways, and sepulchres are still to be seen at the edge of the ravine. About four miles to the west are the much more extensive ruins of *Falerii Novi*, now known as Sta Maria di Falleri. They present some of the most remarkable specimens of ancient military architecture now in existence, consisting of walls nearly perfect, a large number of square towers in good preservation, and several finely-arched gateways. In the internal area the most important buildings are a Roman theatre erected on Etruscan foundations, and a Lombard church of the 12th century (the Abbazia di Sta Maria). The population of Civita Castellana is about 4000.

CIVITA DI PENNE, an episcopal town of Italy, at the head of a district in the province of Abruzzo Ulteriore I., 19 miles west of Pescara. Under the name of Pinna it was the chief city of the Vestini, and is celebrated in the history of the Social war for its obstinate resistance to the Roman army by which it was besieged. It has still some remains of ancient buildings, and numerous inscriptions that attest its importance, and it is noted for the manufacture of artificial flowers. Population, 9800.

CIVITA VECCHIA, a maritime city and port of the Roman territory, which gives its name to a "delegation," or province. It is the best and almost the only port on the coast of the former territories of the church, and is about 24 miles to the west of Rome. The city occupies the site of the ancient *Centum Cellæ*, so called from a palace which the Emperor Trajan built there. That place, which after Trajan had by means of an aqueduct brought good water thither from the mountain of Tolfo, acquired considerable importance as the natural port of Rome. Totila besieged it; Narses recovered it; but it was utterly destroyed in 812 by the Saracens, who were then ravaging all that coast. The inhabitants fled to the neighbouring mountains, but when Pope Leo IV. had overcome and driven away the Saracens, they returned to the old site, rebuilt the town, and called it Civita Vecchia. The articles exported from Civita Vecchia are timber, sulphur, wool and silk, skins, decorative marbles, and anchovies. The imports consist of wines, forged iron, salt provisions, stock-fish, linen, woollen, and cotton cloths, silks, coffee, sugar, and general colonial produce. The port enjoyed under the Popes commercial freedom and sundry special privileges. But its commerce declined in recent times almost to zero. Some little life is imparted to the place from its being a station for steamers on their way from Genoa and Leghorn to Naples, and from the residence of consuls of all nations. But the city, which apart from its territory has only 8143 inhabitants, is a squalid-looking place. On the land side it is protected by fortifications once of considerable import-

ance. The principal of these is the castle erected by the architect Vangallo for Pope Julius II., after a design attributed to Michelangelo, and by others to Bramante. In the immediate vicinity of this castle are the arsenal and the bagno or establishment for convicts.

CLACKMANNAN, a county of Scotland, on the north bank of the River Forth, situated between $56^{\circ} 5'$ and $56^{\circ} 14'$ N. lat., and $3^{\circ} 33'$ and $3^{\circ} 56'$ W. long., is bounded on the S.W. by the Forth, W. by Stirlingshire, N. and N.W. by Perthshire and a detached portion of Stirling, E. by Fife, and N.E. by a detached portion of Perth. It is the smallest county in the United Kingdom, is irregular in form, and occupies an area of $47\frac{1}{2}$ square miles, or 30,477 acres. The surface of the county is varied in its character. An elevated ridge rises on the west, and, running through the middle of the county, spreads itself gradually till it reaches the eastern boundary, skirting the alluvial or carse lands in the valleys of the Forth and of the Devon. Still further to the north, the Ochil Hills (the highest of which is Bencleuch, 2363 feet, above Tillicoultry) form a very picturesque landscape, having their generally verdant surface broken by bold projecting rocks and deeply indented ravines. The range forms a great igneous mound, developing itself in amygdaloid felspar and porphyry, and occasionally in pentagonal columns of basaltic greenstone. It is used almost entirely for sheep farming.

The only streams worthy of notice which traverse the county are the Devon and the Black or South Devon. The former, remarkable in the upper parts of its course for its romantic scenery, runs through the county near the base of the Ochils, and falls into the Forth at the village of Cambus. The Black Devon flows westward in a direction nearly parallel to the Devon, and falls into the Forth near Clackmannan. It supplies motive power to numbers of mills and coal engines; and its whole course is over coal strata. The Forth is navigable as far as it forms the boundary of this county, and ships of 500 tons burden can run up as far as Alloa.

The soils of the arable land of Clackmannanshire are in general productive and well cultivated; though the greater part of the elevated range which is interposed between the carse lands on the Forth and the vale of Devon at the base of the Ochils on the north consists of inferior soils, often incumbent on an impervious clay. All the crops commonly raised in Scotland grow luxuriantly on both sides of this tract, which also contains within itself a considerable proportion of valuable soil. According to the agricultural returns for 1875 the area of land under cultivation in Clackmannan is considerably above the average for Scotland, and the average under corn is 7 per cent. above the average of other counties. In minerals the county is rich. Iron-ore (hæmatite), copper, silver, lead, cobalt, and arsenic have all been discovered in small quantity in the Ochils, between Airthry and Dollar. Iron-stone is wrought to a considerable extent for the Devon iron-works, near Clackmannan. It is found either in beds, or in oblate balls imbedded in slaty clay, and yields from twenty-five to thirty per cent. of iron. Coal has been wrought for upwards of two hundred years in this county. A considerable proportion of the quantity obtained is shipped at Alloa for foreign ports. It is all bituminous or common coal of a good quality; no smithy or caking coal has yet been discovered. In 1871 there were 2137 persons engaged in coal mining and its adjuncts. The strata which compose the coal-field are varieties of sand-stone, shale, fire-clay, and argillaceous ironstone. The great coal-field of Scotland, which passes in a diagonal line from the mouths of the Forth and Tay to the Irish Sea, is bounded by the Ochils; no coal has been found to the north of them, except at Brora, in Sutherlandshire.

There is a considerable manufacturing industry in the county. Woollens are made extensively at Tillicoultry; and at other parts distilling, brewing, coopering, tanning, glass-blowing, and ship-building are carried on. In 1871 there were 4952 persons engaged in connection with the woollen manufacture, or more than a fifth of the whole population.

Among the antiquities of Clackmannan may be mentioned the ruins of Castle Campbell, an old seat of the Argyll family, occupying a singularly wild and almost inaccessible situation, above the village of Dollar. It was burned by Montrose in 1644. The tower of Alloa, built prior to the year 1300, the residence of the Erskines, earls of Mar, now belonging to the representative of that noble family, is in good preservation. The tower of Clackmannan was long the seat of a lineal descendant of the Bruce family after the failure of the male line.

According to the parliamentary return for 1873 Clackmannan county was divided among 1227 proprietors, the average size of the properties amounting to $24\frac{1}{2}$ acres (that of all Scotland being 143), while the average value of the land was £3, 4s. 6d. per acre (that of Scotland being £1). There were in the same year 1137 properties of less than 1 acre, 52 of 1 and under 10 acres, 20 of 10 and under 100, and 5 above 2000—the largest amounting to 6163 acres, the property of the earl of Kellie.

Clackmannanshire sends a member to Parliament conjointly with the county of Kinross and certain adjoining parishes. By the Reform Bill, the parishes of Culross and Tulliallan, formerly comprehended in the county of Perth, Alva, formerly belonging to Stirling, and the Perthshire portion of Logic were included in the parliamentary group. The population of the county in 1861 was 21,450, and in 1871, 23,747, consisting of 11,555 males and 12,192 females. The principal towns are—Alloa, population 9000; Tillicoultry, 3700; Dollar, 2100; and Clackmannan, 1300.

CLAIRAULT, or CLAIRAUT, ALEXIS-CLAUDE (1713–1765), a French mathematician, was born on May 7, 1713, at Paris, where his father was a teacher of mathematics. Under his father's tuition he made so rapid progress in mathematical studies, that in his thirteenth year he read before the French Academy an account of the properties of four curves which he had then discovered. When only sixteen, he finished his treatise on *Curves of Double Curvature*, which, on its publication two years later, procured his admission into the Academy of Sciences, although even then he was below the legal age. In 1736, together with his friend Maupertuis, he took part in the famous expedition to Lapland, which was undertaken for the purpose of estimating a degree of the meridian, and on his return he published his treatise *Sur la figure de la terre*. In his work on this subject he promulgated his theorem in regard to the variation of gravity, which has been corrected by Sir G. Airy. He obtained an ingenious approximate solution of the problem of the three bodies; in 1750 he gained the prize of the St Petersburg Academy for his treatise on the Lunar Theory; and in 1759 he calculated the perihelion of Halley's comet. Clairault died at Paris, May 17, 1765.

CLAMECY, a town of France at the head of an arrondissement, in the department of Nièvre, at the confluence of the Yonne and Beuvron, 38 miles N.N.E. of Nevers. It has some remains of its ancient castle, and of the massive walls by which it was formerly surrounded, several Gothic churches, and a handsome modern chateau. There are manufactures of woollen cloths, earthenwares, paper, and leather, and a considerable trade in wood and charcoal, principally with Paris, by means of the Yonne. Population in 1872, 4717.

CLAN. The Goidelic word *cland* or *clann* (in Welsh, *plant*) signifies seed, and in a general sense children, descendants. In the latter sense it was used as one of many terms to designate groups of kindred in the tribal system of government which existed in Ireland and the Highlands of Scotland. Through the latter country the word passed into the English language, first in the special sense of the Highland clan, afterwards as a general name for a tribe or group of kinsmen. The results of inquiries into the tenure of land in different countries and the ancient laws and institutions of Aryan nations, and the publication of various Celtic documents, particularly the ancient laws of Ireland and Wales, have thrown much light on the constitution of the clan system, and given to it a wider and more important interest than it had hitherto possessed.

Before the use of surnames and elaborate written genealogies, a tribe in its definite sense was called a *tuath*, a word of wide affinities, from a root *tu*, to grow, to multiply, existing in all European languages. When the tribal system began to be broken up by conquest and by the rise of towns and of territorial government, the use of a common surname furnished a new bond for keeping up a connection between kindred. The head of a tribe or smaller group of kindred selected some ancestor and called himself his *Ua*, grandson, or as it has been anglicized *O'*, e.g., *Ua Conchobair* (*O' Connor*), *Ua Suilleabhain* (*O' Sullivan*). All his kindred adopted the same name, the chief using no fore-name however. The usual mode of distinguishing a person before the introduction of surnames was to name his father and grandfather, e.g., Owen, son of Donal, son of Dermot. This naturally led some to form their surnames with *Mac*, son, instead of *Ua*, grandson, e.g., *Mac Carthaigh*, son of *Carthach* (*Mac Carthy*), *Mac Ruaidhri*, son of *Rory* (*Macrory*). Both methods have been followed in Ireland, but in Scotland *Mac* came to be exclusively used. The adoption of such genealogical surnames fostered the notion that all who bore the same surname were kinsmen, and hence the genealogical term *clann*, which properly means the descendants of some progenitor, gradually became synonymous with *tuath*, tribe. Like all purely genealogical terms, *clann* may be used in the limited sense of a particular tribe governed by a chief, or in that of many tribes claiming descent from a common ancestor. In the latter sense it was synonymous with *sil*, *siol*, seed, e.g., *Siol Alpine*, a great clan which included the smaller clans of the Macgregors, Grants, Macinnons, Macnabs, Macphics, Macquarries, and Macanlays.

The clan system in the most archaic form of which we have any definite information can be best studied in the Irish *tuath*, or tribe. This consisted of two classes:—(1) tribesmen, and (2) a miscellaneous class of slaves, criminals, strangers, and their descendants. The first class included tribesmen by blood in the male line, including all illegitimate children acknowledged by their fathers, and tribesmen by adoption or sons of tribeswomen by strangers, foster-sons, men who had done some signal service to the tribe, and lastly the descendants of the second class after a certain number of generations. Each *tuath* had a chief called a *rig*, king, a word cognate with the Gaulish *rig-s* or *rix*, the Latin *reg-s* or *rex*, and the Old Norse *rik-ir*. The tribesmen formed a number of communities, each of which, like the tribe itself, consisted of a head, *ceann fine*, his kinsmen, slaves, and other retainers. This was the *fine*, or sept. Each of these occupied a certain part of the tribe-land, the arable part being cultivated under a system of co-tillage, the pasture land co-grazed according to certain customs, and the wood, bog, and mountains forming the marchland of the sept being the unrestricted common land of the sept. The sept was in fact a village community like the

Russian *mir*, or rather like the German *gemeinde* and Swiss *almend*, which Sir H. S. Maine, M. de Laveleye, and others have shown to have preceded in every European country the existing order of things as respects ownership of land.

What the sept was to the tribe, the homestead was to the sept. The head of a homestead was an *aire*, a representative freeman capable of acting as a witness, con-purgator, and bail. These were very important functions, especially when it is borne in mind that the tribal homestead was the home of many of the kinsfolk of the head of the family as well as of his own children. The descent of property being according to a gavel-kind custom, it constantly happened that when an *aire* died the share of his property which each member of his immediate family was entitled to receive was not sufficient to qualify him to be an *aire*. In this case the family did not divide the inheritance, but remained together as "a joint and undivided family," one of the members being elected chief of the family or household, and in this capacity enjoyed the rights and privileges of an *aire*. Sir H. S. Maine has directed attention to this kind of family as an important feature of the early institutions of all Aryan nations. Beside the "joint and undivided family" there was another kind of family which we might call "the joint family." This was a partnership composed of three or four members of a sept whose individual wealth was not sufficient to qualify each of them to be an *aire*, but whose joint wealth qualified one of the co-partners as head of the joint family to be one.

So long as there was abundance of land each family grazed its cattle upon the tribe-land without restriction; unequal increase of wealth and growth of population naturally led to its limitation, each head of a homestead being entitled to graze an amount of stock in proportion to his wealth, the size of his homestead, and his acquired position. The arable land was no doubt apportioned annually at first; gradually, however, some of the richer families of the tribe succeeded in evading this exchange of allotments and converting part of the common land into an estate in severalty. Septs were at first colonies of the tribe which settled on the march-land; afterwards the conversion of part of the common land into an estate in severalty enabled the family that acquired it to become the parent of a new sept. The same process might, however, take place within a sept without dividing it; in other words, several members of the sept might hold part of the land of the sept as separate estate. The possession of land in severalty introduced an important distinction into the tribal system—it created an aristocracy. An *aire* whose family held the same land for three generations was called a *flaith*, or lord, of which rank there were several grades according to their wealth in land and chattels. The *aires* whose wealth consisted in cattle only were called *bó-aires*, or cow-*aires*, of whom there were also several grades, depending on their wealth in stock. When a *bó-aire* had twice the wealth of the lowest class of *flaith* he might enclose part of the land adjoining his house as a lawn; this was the first step towards his becoming a *flaith*. The relations which subsisted between the *flaiths* and the *bó-aires* formed the most curious part of the Celtic tribal system, and throw a flood of light on the origin of the feudal system. Every tribesman without exception owed *ceilsinne* to the *rig*, or chief, that is, he was bound to become his *ceile*, or vassal. This consisted in paying the *rig* a tribute in kind, for which the *ceile* was entitled to receive a proportionate amount of stock without having to give any bond for their return, giving him service, e.g., in building his *dun*, or stronghold, reaping his harvest, keeping his roads clean and in repair, killing wolves, and especially service in the field, and doing him homage three times

while seated every time he made his return of tribute. Paying the "*calpe*" to the Highland chiefs represented this kind of vassalage, a *colpdach* or heifer being in many cases the amount of food-rent paid by a free or *saer ceile*. A tribesman might, however, if he pleased, pay a higher rent on receiving more stock together with certain other chattels for which no rent was chargeable. In this case he entered into a contract, and was therefore a bond or *daer ceile*. No one need have accepted stock on these terms, nor could he do so without the consent of his sept, and he might free himself at any time from his obligation by returning what he had received, and the rent due thereon.

What every one was bound to do to his *ríg*, or chief, he might do voluntarily to the *flaith* of his sept, to any *flaith* of the tribe, or even to one of another tribe. He might also become a bond *ceile*. In either case he might renounce his ceileship by returning a greater or lesser amount of stock than what he had received according to the circumstances under which he terminated his vassalage. In cases of disputed succession to the chiefship of a tribe the rival claimants were always anxious to get as many as possible to become their vassals. Hence the anxiety of minor chieftains, in later times in the Highlands of Scotland, to induce the clansmen to pay the "*calpe*" where there happened to be a doubt as to who was entitled to be chief.

The effect of the custom of gavel-kind was to equalize the wealth of each and leave no one wealthy enough to be chief. The "joint and undivided family," and the formation of "joint families," or gilds, was one way of obviating this result; another way was the custom of tanistry. The headship of the tribe was practically confined to the members of one family; this was also the case with the headship of a sept. Sometimes a son succeeded his father, but the rule was that the eldest and most capable member of the *geilfine*, that is the relatives of the actual chief to the fifth degree,¹ was selected during his lifetime to be his successor,—generally the eldest surviving brother or son of the preceding chief. The man selected as successor to a chief of a tribe, or chieftain of a sept, was called the tanist, and should be "the most experienced, the most noble, the most wealthy, the wisest, the most learned, the most truly popular, the most powerful to oppose, the most steadfast to sue for profits and [be sued] for losses." In addition to these qualities he should be free from personal blemishes and deformities, and of fit age to lead his tribe or sept, as the case may be, to battle.² So far as selecting the man of the *geilfine* who was supposed to possess all those qualities, the office of chief of a tribe or chieftain of a sept was elective, but as the *geilfine* was represented by four persons together with the chief or chieftain, the election was practically confined to one of the four. In order to support the dignity of the chief or chieftain a certain portion of the tribe or sept land was attached as an apanage to the office; this land, with the *duns*, or fortified residences upon it, went to the successor, but a chief's own property might be gavelled. This custom of tanistry applied at first probably to the selection of the successors of a *ríg*, but was gradually so extended that even a *bó-aire* had a tanist.

A sept might have only one *flaith*, or lord, connected with it, or might have several. It sometimes happened, however, that a sept might be so broken and reduced as not to have even one man qualified to rank as a *flaith*. The rank of a *flaith* depended upon the number of his *ceiles*,

that is, upon his wealth. The *flaith* of a sept, and the highest when there was more than one, was *ceann fine*, or head of the sept, or as he was usually called in Scotland, the chieftain. He was also called the *flaith geilfine*, or head of the *geilfine*, that is, the kinsmen to the fifth degree from among whom should be chosen the tanist, and who according to the custom of gavel-kind were the immediate heirs who received the personal property and were answerable for the liabilities of the sept. The *flaiths* of the different septs were the vassals of the *ríg*, or chief of the tribe, and performed certain functions which were no doubt at first individual, but in time became the hereditary right of the sept. One of those was the office of *maer*, or steward of the chief's rents, &c.;³ and another that of *aire tuisi*, leading *aire*, or *taoisech*, a word cognate with the Latin *duc-s* or *dux*, and Anglo-Saxon *here-tog*, leader of the "here," or army. The *taoisech* was leader of the tribe in battle; in later times the term seems to have been extended to several offices of rank. The cadet of a Highland clan was always called the *taoisech*, which has been translated captain; after the conquest of Wales the same term, *tywysaug*, was used for a ruling prince. Slavery was very common in Ireland and Scotland; in the former slaves constituted a common element in the stipends or gifts which the higher kings gave their vassal *sub-reguli*. Female slaves, who were employed in the houses of chiefs and *flaiths* in grinding meal with the hand-mill or quern, and in other domestic work, must have been very common, for the unit or standard for estimating the wealth of a *bó-aire*, blood-fines, &c., was called a *cumhal*, the value of which was three cows, but which literally meant a female slave. The descendants of those slaves, prisoners of war, forfeited hostages, refugees from other tribes, broken tribesmen, &c., gathered round the residence of the *ríg* and *flaiths*, or squatted upon their march-lands, forming a motley band of retainers which made a considerable element in the population, and one of the chief sources of the wealth of chiefs and *flaiths*. The other principal source of their income was the food-rent paid by *ceiles*, and especially by the *daer* or bond *ceiles*, who were hence called *biathachs*, from *biad*, food. A *flaith*, but not a *ríg*, might, if he liked, go to the house of his *ceile* and consume his food-rent in the house of the latter.

Under the influence of feudal ideas and the growth of the modern views as to ownership of land, the chiefs and other lords of clans claimed in modern times the right of bestowing the tribe-land as *turcrec*, instead of stock, and receiving rent not for cattle and other chattels as in former times, but proportionate to the extent of land given to them. The *turcrec*-land seems to have been at first given upon the same terms as *turcrec*-stock, but gradually a system of short leases grew up; sometimes, too, it was given on mortgage. In the Highlands of Scotland *ceiles* who received *turcrec*-land were called "taksmen." On the death of the chief or lord, his successor either bestowed the land upon the same person or gave it to some other relative. In this way in each generation new families came into possession of land, and others sank into the mass of mere

¹ It is right to mention that the explanation here given of *geilfine* is different from that given in the introduction to the third volume of the *Ancient Laws of Ireland*, which has been followed by Sir H. S. Maine in his account of it in his *Early History of Institutions*, and which the present writer believes to be erroneous.

² It should also be mentioned that illegitimacy was not a bar. The issue of "handfast" marriages in Scotland were eligible to be chiefs, and even sometimes claimed under feudal law.

³ This office is of considerable importance in connection with early Scottish history. In the Irish annals the *ríg*, or chief of a great tribe (*mor tuath*), such as of Ross, Moray, Marr, Buchan, &c., is called a *mor maer*, or great *maer*. Sometimes the same person is called king also in these annals. Thus *Findlaec*, or Finlay, son of *Ruadhri*, the father of Shakespeare's Macbeth, is called king of Moray in the *Annals of Ulster*, and *mor maer* in the *Annals of Tighearnach*. The term is never found in Scottish charters, but it occurs in the Book of the Abbey of Deir in Buchan, now in the library of the University of Cambridge. The Scotie kings and their successors obviously regarded the chiefs of the great tribes in question merely as their *maers*, while their tribesmen only knew them as kings. From these "*mor-maerships*," which corresponded with the ancient *mor tuatha*, came most, if not all, the ancient Scottish earldoms.

tribesmen. Sometimes a "taksman" succeeded in acquiring his land in perpetuity, by gift, marriage, or purchase, or even by the "strong hand." The universal prevalence of exchangeable allotments, or the rundale system, shows that down to even comparatively modern times some of the land was still recognized as the property of the tribe, and was cultivated in village communities.

The chief governed the clan by the aid of a council called the *sabaid* (*sab*, a prop), but the chief exercised much power, especially over the miscellaneous body of non-tribesmen who lived on his own estate. This power seems to have extended to life and death. Several of the *flaiths*, perhaps, all heads of septs, also possessed somewhat extensive powers of the same kind.

The Celtic dress, at least in the Middle Ages, consisted of a kind of shirt reaching to a little below the knees called a *lenn*, a jacket called an *iuar*, and a garment called a *brat*, consisting of a single piece of cloth. This was apparently the garb of the *aires*, who appear to have been further distinguished by the number of colours in their dress, for we are told that while a slave had clothes of one colour, a *rig tuatha*, or chief of a tribe, had five, and an *ollamh* and a superior king, six. The breeches was also known, and cloaks with a cowl or hood, which buttoned up tight in front. The *lenn* is the modern kilt, and the *brat* the plaid, so that the dress of the Irish and Welsh in former times was the same as that of the Scottish Highlander.

By the abolition of the heritable jurisdiction of the Highland chiefs, and the general disarmament of the clans by the Acts passed in 1747 after the rebellion of 1745, the clan system was practically broken up, though its influence still lingers in the more remote districts. An Act was also passed in 1747 forbidding the use of the Highland garb; but the injustice and impolicy of such a law being generally felt it was afterwards repealed. (W. K. S.)

CLAPARÈDE, JEAN LOUIS RENÉ ANTOINE ÉDOUARD, (1832-1870), an eminent naturalist, was born at Geneva, April 24, 1832, and belonged to an ancient family of that city. His father was pastor of the parish of Chaney, and Édouard's early years were spent in that village. After a distinguished course at the classical college, the gymnasium, and the academy of his native city, he repaired in 1852 to the university of Berlin, and there devoted himself with self-sacrificing ardour to the study of medicine and the natural sciences and the acquisition of the Germanic languages of Northern Europe. The direction of his investigations was greatly affected by J. Müller and Ehrenberg, the former of whom was at that period engaged in his important researches about the Echinodermus. In 1855 he accompanied Müller to Norway, and there spent two months on a desolate reef that he might obtain satisfactory observations. The latter part of his stay at Berlin he devoted, along with Lachmann, to the study of the Infusoria and Rhizopods; and their united labours resulted in an important publication which at once gave them rank among the chief zoologists of the day. In 1857 he obtained the degree of doctor, and soon after he was chosen professor of comparative anatomy in the academy of Geneva. Here he continued to teach with ever growing acceptance; and he even became a favourite of the general public through his popular lectures. In 1859 he visited England, and, in

1 The following oath was administered at Fort William and other places in 1747 and 1748:—

"I, [name], do swear, as I shall answer to God at the great day of judgment, that I have not, nor shall have, in my possession any gun, sword, pistol, or any arm whatsoever, and that I never use tartan, plaid, or any part of the Highland garb; and if I do so, may I be cursed in my undertakings, family, and property,—may I never see my wife and children, father, mother, or relations,—may I be killed in battle as a coward, and lie without Christian burial in a strange land, far from the graves of my forefathers and kindred; may all this come across me if I break my oath."

company with Dr Carpenter, took a voyage to the Hebrides; and in 1863 he spent some months in the Bay of Biscay. On the appearance of Darwin's work on the *Origin of Species*, he adopted his theories and published a valuable series of articles on the subject in the *Revue Germanique*, 1861. His enormous activity might seem to indicate vigorous health; but he was a martyr from the year 1854 to a painful affection of the heart, which caused excessive palpitations, frequently accompanied by spitting of blood. During 1865 and 1866 he was quite incapable of work, and he determined to pass the winter of 1866-7 in Naples. The change of climate produced some amelioration, and the patient's indomitable energy was attested by two elaborate volumes on the Annelidæ of the Gulf. He again visited Naples with advantage in 1868; but in 1870, instead of recovering as before, he grew worse, dropsy set in, and on the 31st of May he died at Siena on his way home. Modest and retiring, he was at the same time generous, hospitable, and helpful; and in spite of his physical weakness, he displayed remarkable spirit in the political disturbances of Geneva. A certain bluntness of expression sometimes made him fail of courtesy in debate, and he could be pitilessly severe in his criticism where he thought severity was deserved; but he was at the same time strikingly free from uncharitableness, jealousy, or resentment. His library was bequeathed to his native city. See the notice of his life by Henri de Saussure in the 42d vol. of the *Archives des Sciences physiques et naturelles* (Bibliothèque Univ. et Revue Suisse), Geneva, 1871.

Besides the works already mentioned his chief contributions to science are:—"Ueber Actinophrys Eichenhornii," in Müller's *Arch. für Anatomie*, 1855; "Sur la théorie de la formation de l'Œuf," in *Arch. des Sci.*, 1855; "Anatomie und Entwicklungsgeschichte der Neritina fluviatilis," in Müller's *Arch.*, 1857; various papers in regard to binocular vision in the *Arch. des Sci.*, 1858 and 1859; "Zur Morphologie der Zusammengesetzten Augen bei den Arthropoden" in *Zeitsch. für Wissensch. Zool.*, 1860; *Recherches anat. sur les Oligochètes*, Gen., 1862; *Rech. sur l'évolution des Araignées*, 1862, which obtained the gold medal of the Utrecht Society of Arts and Sciences; *Beobacht. über Anat. und Entwicklungsgesch. Wirbelloser Thiere an der Küste der Normandie*, 1863; "De la myopie," in *Arch. des Sci.*, 1863; "Studien an Akariden," in *Zeitsch. für Wiss. Zool.*, 1863; and "Histologische Untersuch. über den Regenwurm (*Lumbricus terrestris*)" in do., 1863. He left in MSS. *Recherches sur la structure des Annelides sédentaires*.

CLAPPERTON, HUGH (1788-1827), an African traveller, was born in 1788 at Annan, Dumfriesshire, where his father was a surgeon. In his youth he gained some knowledge of practical mathematics and navigation; and while still very young he was apprenticed on board a vessel which traded between Liverpool and North America. After having made several voyages across the Atlantic, he was impressed for the navy, in which, having a little influence and much intelligence and physical vigour, he soon rose to the rank of midshipman. He acted as drill sergeant in the "Asia," the flag-ship of Vice-Admiral Cochrane, and was promoted to the rank of lieutenant, and to the command of a schooner on the Canadian lakes. In the year 1817, when the flotilla on the lakes was dismantled, he returned to his native country on half-pay.

In 1820 Clapperton removed to Edinburgh, where he contracted an intimacy with Dr Oudney, who first awoke his interest in the cause in which both were destined to perish. After the return of Captain Lyon, the British Government having determined on equipping a second expedition for the purpose of exploring Northern Africa, Dr Oudney was appointed to proceed to Bornu as consul, and Clapperton and Colonel Denham were added to the party. From Tripoli, early in 1822, they set out southward to Mrzuk, and from this point Clapperton and Oudney travelled westward into the country of the Tuaricks, as far as Ghraat, 11° E. long. On the 17th February 1823 they reached Kouka the capital of Bornu, where they

were well received by the sultan ; and after remaining here till the 14th December they again set out for the purpose of exploring the course of the Niger. They arrived in safety at Murmur, where Oudney breathed his last in the arms of his companion. Clapperton, however, penetrated alone as far as Sackatu, 13° N. lat. and 6½° E. long., where he was obliged to stop, though the Niger was only five days' journey to the west. Worn out with travel he returned to Kouka, where he again met Denham. The two travellers then set out for Tripoli, and thence proceeded to England, where they arrived on June 1, 1825. An account of the travels of Denham, Clapperton, and Oudney was published under the title of *The Narrative of Travels and Discoveries in Northern and Central Africa in the years 1822-24*.

Immediately after his return Clapperton was raised to the rank of commander, and sent out with another expedition to Africa. He set sail in August 1825, in company with Captain Pearce, Mr Dickson, Dr Morrison, and Richard Lander, who acted as his servant. On this occasion he landed at Badagry in the Bight of Benin, and immediately commenced his journey into the interior, along with Lander, Captain Pearce, and Dr Morrison. The last two soon fell victims to the hardships of the journey ; but in January 1826 Clapperton reached Katunga, the capital of Yariba, and soon afterwards crossed the Niger at Broussa, the spot where Mungo Park met his untimely fate. In July he arrived at Kano, a city which he had previously visited. Here he left his servant with the baggage, and proceeded alone to Sackatu, intending to proceed to Timbuctu. The sultan, however, detained him, and being seized with dysentery he died at Sackatu on the 13th April 1827. His Journal was published by Lander, who also wrote a work entitled *Records of Captain Clapperton's last Expedition to Africa*, which appeared in 1830, in 2 vols. 12mo.

CLARE, a maritime county in the south-west of Ireland, in the province of Munster, bounded N.W. by the Atlantic, S. by the estuary of the Shannon, S.E. and N.E. by Limerick, Tipperary, Lough Derg, and Galway, having an area of 1293 square miles, or 827,994 acres.

Although the surface of the county is hilly, and in some parts even mountainous, it nowhere rises to a great elevation. Much of the western baronies of Moyarta and Ibrickan is composed of bog land. Bogs are frequent also in the mountainous districts elsewhere, except in the limestone barony of Burren, the inhabitants of some parts of which supply themselves with turf from the opposite shores of Connemara. Generally speaking, the eastern parts of the county are mountainous, with tracts of rich pasture land interspersed ; the west abounds with bog ; and the north is rocky and best adapted for grazing sheep. In the southern part, along the banks of the Fergus and Shannon, are the bays of rich low grounds called corcasses, of various breadth, indenting the land in a great variety of shapes. They are composed of deep rich loam, and are distinguished as the black corcasses, adapted for tillage, and the blue, used more advantageously as meadow land.

The coast is in general rocky, and occasionally bold and precipitous in the extreme, as may be observed at the picturesque cliffs of Moher within a few miles of Ennistymon and Lisdoonvarna, which rise perpendicularly at O'Brien's tower to an elevation of 580 feet. The coast of Clare is indented with several bays, the chief of which are Ballyvaghan, Liscannor, and Malbay ; but from Black Head to Loop Head, that is, along the entire western boundary of the county formed by the Atlantic, there is no safe harbour except Liscannor Bay. The county possesses only one large river, the Fergus ; but nearly 100 miles of its boundary-line are washed by the River Shannon, which, after almost dividing

Ireland from north to south, and dispensing its bounties to the adjoining counties of Roscommon, Leitrim, Longford, Westmeath, Galway, King's County, Kerry, Tipperary, and Limerick, enters the Atlantic Ocean between this county and Kerry. The numerous bays and creeks on both sides of this noble river render its navigation safe in every wind ; but the passage to and from Limerick is often tedious, and the port of Kilrush has from that cause gained in importance. The River Fergus is navigable from the Shannon to the town of Clare, which is the terminating point of its natural navigation, and the port of all the central districts of the county. A railway traverses Clare county *via* Ennis, connecting Limerick with Athenry and Galway.

There are upwards of one hundred lakes and tarns in the county, of which the largest are Loughs O'Grady, Grange, Tedane, Inchiquin, Inniscronan, and Clonlea ; but they are more remarkable for picturesque beauty than size or utility, with the exception of the extensive and navigable Lough Derg, formed by the River Shannon between this county and Tipperary.

Although metals and minerals have been found in many places throughout the county, they do not often show themselves in sufficient abundance to induce the application of capital for their extraction. The principal metals are lead, iron, and manganese. Lead mines were recently worked at Kilbricken in the barony of Bunratty (about six miles from Ennis), and at Annaglongh. The Milltown lead mine in the barony of Tulla is probably one of the oldest mines in Ireland, and at one time, if the extent of the ancient excavations may be taken as a guide, there must have been a very rich deposit. The richest lead mine worked in recent times is that of Ballyhickey, about two miles from Kilbricken. Copper pyrites occurs in several parts of Burren, but in small quantity. Coal exists at Labasheeda on the right bank of the Shannon, but the seams are thin. Limestone occupies all the central and northern parts of the county in a tract bounded on the S. by the Shannon, on the E. by a line running parallel with the Ougaruee River to Scariff Bay, on the N. by the mountain of Talla and the confines of Galway, on the W. by Galway Bay and a line including Kilfenora, Corofin, and Ennis, and meeting the Shannon at the mouth of the Fergus. Within half a mile of the Milltown lead mine are immense natural vaulted passages of limestone, through which the River Ardsullas winds a singular course. The lower limestone of the eastern portion of the county has been found to contain several very large deposits of argenticiferous galena. Flags, easily quarried, are procured near Kilrush, and thinner flags near Ennistymon. Slates are quarried in several places, the best being those of Broadford and Killaloe, which are nearly equal to the finest procured in Wales. A species of very fine black marble is obtained near Ennis ; it takes a high polish, and is free from the white spots with which the black Kilkenny marble is marked.

The mineral springs, which are found in many places, are chiefly chalybeate. That of Lisdoonvarna, about eight miles from Ennistymon, has long been celebrated for its medicinal qualities. There are chalybeate springs of less note at Scool, Colneen, Kilkishen, Burren, Kilcoran, Broadford, Lahiuch, Kilkee, Kilrush, Killadysart, and Casino, near Milltown Malbay. Springs called by the people "holy" or "blessed" wells, generally mineral waters, are common ; but the belief in their power of performing cures in inveterate maladies is nearly extinct.

The Atlantic Ocean and the estuary of the Shannon afford many situations admirably adapted for summer bathing-places. Among the best frequented of these localities are Burren, Milltown Malbay, with one of the best beaches on the western coast, Lahinch, about two miles from Ennistymon, and near the interesting cliffs of Moher,

which has a magnificent beach, on Liscannor Bay, and forms a delightful summer residence, Kilkee, perhaps the most fashionable watering-place on the western coast of Ireland, and Kilrush on the Shannon estuary.

The soil and surface of the county is in general better adapted for grazing than for tillage. Agriculture is in a backward state, there not being a fifth part of its area under cultivation. In 1870 the acreage of the county under crops amounted to 147,662 acres, and in 1875 little advance had been made. The number of acres under the principal crops in these two years stood as follows:—

	Oats.	Wheat.	Potatoes.	Turnips and other Green Crops.	Meadow.
1870	18,776	7828	33,107	9,764	73,429
1875	17,354	3296	28,459	10,411	84,927

As regards live stock the same stationary condition of its agricultural industry will be apparent from the following figures:—

	Cattle.	Sheep.	Pigs.	Horses and Mules.	Poultry.
1870	100,839	15,100	24,771	6601	284,551
1875	100,405	13,459	21,413	6989	323,635

As regards the property in the county, the land in 1874 was divided among 1025 separate owners, of whom 243 possessed less than one acre, and 782 one acre and upwards. Twelve proprietors owned more than 10,000 acres each, the most extensive demesnes being in the hands of Lord Leconfield, with 37,292 acres; the marquis of Conyngham, with 27,613; E. P. Westby, 25,779; Lord Inchiquin, 20,321; Colonel Vaudeleur, 19,790; and the Hon. C. W. White, 18,266. The value of the land was at the same date rated at an average of 8s. 3d. per acre, while that of all Munster was 11s. 2d.

There are no extensive manufactures in the county of Clare, although flannels and friezes are made for home use, and hosiery of various kinds, chiefly coarse and strong, is made around Corofin, Ennistymon, and other places. The Shannon, west of Scattery Island, and the sea along the coasts, are good fishing stations, abounding with cod, haddock, ling, sole, turbot, ray, mackerel, and other fish, but the rugged nature of the coast and the tempestuous sea greatly hinder the operations of the fishermen. Near Pooldoody is the great Burren oyster bed called the Red Bank, where a large establishment is maintained, and from which a constant supply of the excellent Red Bank oysters is furnished to the Dublin and other large markets. Crabs and lobsters are caught on the shores of the Bay of Galway in every creek from Blackhead to Ardfry. The salmon fishery of the Shannon is very considerable, and eels, which abound in every rivulet, form an important article of consumption.

The population of the county shows a remarkable decrease within the 30 years between 1841 and 1871, although, after all, this is exceeded by the neighbouring counties of Cork, Limerick, and Tipperary. In 1841 the inhabitants numbered 286,394; in 1851, 212,440; in 1861, 166,305; and in 1871, 147,864. Of these 144,440 were Roman Catholics, 8027 Episcopalians, 220 Presbyterians, and 177 of other denominations. In 1874 there were 8709 persons who had obtained parochial relief throughout the year, while during the twenty-four years ending 1875 there had emigrated from the county 90,154 persons. At the date of the last census (1871) 64,566 persons could read and write, and 15,972 could read but could not write; and 4432 were returned as speaking Erse only. There were 12 superior and 253 primary schools in the county. The principal towns in Clare are Ennis, population (1871) 6503; Kilrush, 4424; and Kilkee, 1600. The county returns three members to the Imperial

Parliament,—two for the county and one for the borough of Ennis.

The county of Clare, which is divided into 11 baronies, contains 80 parishes, and includes the diocese of Kilfenora, the greater part of Killaloe, and a very small portion of the diocese of Limerick. It is within the military district of Cork, with barracks for infantry at Clare Castle, Ennis, Killaloe, and Kilrush, and for artillery in the forts at Scattery Island, Donnaha, Kileredano, Blackwater, and Kilkerrin. The assizes are held at Ennis, where the county prison, the county infirmary, and the district lunatic asylum are situated. There are eight poor-law unions.

This county, together with some of the neighbouring district, was anciently called Thomond or Tuadmvin, that is, North Munster, and formed part of the monarchy of the celebrated Brian Boroihme, who held his court at Kincora near Killaloe, where his palace was situated on the banks of the Shannon. The site is still distinguished by extensive earthen ramparts. Settlements were effected by the Danes, and in the 13th century by the Anglo-Normans, but without permanently affecting the possession of the district by its native proprietors. In 1543 Murrough O'Brien, after dispossessing his nephew, and vainly attempting a rebellion against the English rule, proceeded to England, and submitted to Henry VIII., resigning his name and possessions. He soon received them back by an English tenure, together with the title of earl of Thomond, on condition of adopting the English dress, manners, and customs, and maintaining no kerns or gallowglasses. In 1565 this part of Thomond (sometimes called O'Brien's country) was added to Cunnought, and made one of the six new counties into which that province was divided by Sir Henry Sidney under the Act 11 Eliz. c. 9. It was then named Clare, probably from the name of an English adventurer, Thomas de Clare, who obtained a grant from Henry III. of all the lands he should conquer from the Irish, and whose family for some time maintained a precarious position in the district. In 1602 the county was re-annexed to Munster. The O'Briens and other native chieftains had many fierce contests to preserve their independence against the Anglo-Norman and English adventurers, and generally succeeded in maintaining their position as native kings and chieftains of Thomond. From some cause or other the comparative immunity of Clare in ancient times from foreign rule and settlement, and from absenteeism, has proved of doubtful advantage to its modern condition. The chief ancient families of note in the district were the O'Briens, now represented by Lord Inchiquin of Dromoland, the Macnamaras, and the O'Loughlens.

The county abounds with remains of antiquities, both military and ecclesiastical. There still exist above a hundred fortified castles, several of which are inhabited. They are mostly of small extent, a large portion being fortified dwellings. The chief of them is Bunvatty Castle, built in 1277. Rath or Danish forts are to be found in every part. They are generally circular, composed either of large stones without mortar, or of earth thrown up and surrounded by one or more ditches. The list of abbeys and other religious houses formerly flourishing here (some now only known by name, but many of them surviving in ruins) comprehends upwards of twenty. The most remarkable are—Quin, considered one of the finest and most perfect specimens of ancient monastic architecture in Ireland; Corcomroe; Ennis, in which is a very fine window of uncommonly elegant workmanship; and those on Iniscattery, or Scattery Island, in the Shannon, said to have been founded by St Sevanus. On the same island there is a round tower, and also the ruins of what are called the seven churches. It is called Holy Island, and is still one of the most popular burial-places in the county. Four other round

towers are to be found in various stages of preservation—at Druneliffe, Dysert, Kiluby, and Inniscaltra. The cathedral of the diocese of Killaloe, at the town of that name, is a plain massive building originally erected in 1160; and near it are the ruins of the mausoleum of Brian Boróihne. Cromlechs are found, chiefly in the limestone rocky district of Burren, though there are some in other baronies. That at Ballygannor is formed of a stone 40 feet long and 10 broad. The celebrated tomb of Conan, on Mount Callan, is still extant.

CLARE, JOHN (1793–1864), commonly known as “the Northamptonshire Peasant Poet,” was the son of a farm labourer, and was born at Helpstone, near Peterborough, on 13th July 1793. At the age of seven he was taken from school to tend sheep and geese; five years after he wrought on a farm, paying with his own meagre savings for the education he received in the evening. He endeavoured to enter a lawyer’s office but failed, studied algebra, and fell in love, became a pot-boy in a public-house, and subsequently was apprenticed to a gardener, from which employment he ran away. Among the neighbours his manners and habits made an unfavourable impression. He enlisted in the militia, tried camp life with gipsies, and wrought as a lime burner in 1817, but the following year he was obliged to accept parish relief. In 1820 appeared his *Poems Descriptive of Rural Life and Scenery*, which were very indulgently received, and the year following his *Village Minstrel and other Poems* were published. He was greatly patronized; fame, with many curious visitors, broke the tenor of his life, and dangerous habits were formed. From subscriptions he became possessed of £45 annually, a sum far beyond what he had ever earned, but new wants made his income insufficient, and in 1823 he was nearly penniless. His next volume, the *Shepherd’s Calendar*, 1827, met with little success, which was not increased by his hawking it himself. As he wrought again on the fields his health improved; but farm operations being unsuccessful he was “as dull as a fog in November,” and became seriously unwell. Although a noble patron presented him with a new cottage and a piece of ground, Clare was full of anguish to leave the “old home of homes.” The removal to Northborough was his culminating period, and gradually his mind gave way. His last and best work, the *Rural Muse*, published in 1835, was noticed by “Christopher North” alone. Bursts of insanity followed, of which he had for some time shown symptoms; and in July 1837 he was kept in confinement, and was subsequently lodged in Northampton General Lunatic Asylum, where he died May 20, 1864. The neglect of friends and relatives to visit him, together with the non-success of his later poems, preyed heavily upon his mind. In the asylum he penned his most thrilling poem, beginning—“I am! yet what I am who cares or knows?” In its exceeding sadness of thought there is sublime feeling, —a strain of divine music in the wail of woe,—and the poet longed to

“Sleep as I in childhood sweetly slept
Full of high thoughts, unborn. So let me lie,
The grass below, above the vaulted sky.”

Clare was one of our most uneducated poets, and sung from the fulness of his heart; he is one of England’s sweetest singers of nature, whose thoughts “gild life’s brambles with a flower,” and whose songs were gathered from the fields. Many of his sonnets, which display great power of word-painting, are sweet as “sunshine in summer dream.” His ballads and love-songs are wild flowers strewn at will, which “art and fashion fling as weeds away,” and his *Eternity of Nature*, and *First Love’s Recollections* display deftness of touch, pastoral beauty, and genuine poetic ability. All his love and genius were showered on beautifying the rural scenes and humble incidents of his

surroundings. His poems, drawn with a delicate hand, are those of a keen observer, but they greatly want that vigour which is essential to popularity; in his own words, “the tide of fashion is a stream too strong for pastoral brooks that gently flow and sing.”

See the *Life of John Clare* by Frederick Martin, 1865, and *Life and Remains of John Clare*, by J. L. Cherry, 1873, the latter of which, though not so complete, contains some of the poet’s asylum-verses and prose fragments.

CLARENDON, EDWARD HYDE, FIRST EARL OF (1609–1674), historian and statesman, born at Dinton in Wiltshire, on the 18th February 1609, was the third son of Henry Hyde, a gentleman belonging to an ancient Cheshire family. The profession first chosen for him was the church; and consequently, after being educated at home by the vicar of the parish up to the age of thirteen, he was sent to Magdalen College, Oxford. But his eldest brother having died young, the death of his second brother in 1625 left him heir to his father’s estate; and the law being now considered a more appropriate profession, he was entered at the Middle Temple by his uncle, Sir Nicholas Hyde, then treasurer of that society. At the age of twenty he married a daughter of Sir George Ayliffe; but in six months he was left a widower; and three years later he took as his second wife a daughter of Sir Thomas Aylesbury, Master of Requests.

While yet a young man Hyde had the happiness, as he boasts in his autobiography, of being admitted into the most brilliant literary society of his time. Among poets he knew Ben Jonson, Waller, and Carew; he was acquainted with Selden, and with nearly every other scholar of eminence in his day; and he had a rare opportunity of acquiring, from the conversation of the subtle and impartial Chillingworth and the outspoken but liberal-minded Hales, a breadth of sympathy which unhappily his natural temper and the rough pressure of the times combined to prevent him from ever displaying. The brilliant, tender-hearted Falkland also was his most intimate friend. And, fortunately for his professional advancement, besides possessing considerable family influence, he enjoyed the favour of Laud, who, as commissioner of the treasury, regularly consulted him in regard to mercantile affairs.

When, therefore, in April 1640, Hyde took his seat in the Short Parliament as representative of Wootton-Basset, he was already known as a lawyer of mark. During its session of barely three weeks, he made himself prominent as a zealous supporter of the popular party; and his maiden speech consisted of a vigorous attack upon the Earl Marshal’s Court, which had become notorious for the savage manner in which it resented the least affront offered to a man of rank.

In the Long Parliament (in which he sat as member for Saltash) his zeal for reform was at first in no degree diminished. He effected the final overthrow of the Earl Marshal’s Court. He sat as chairman of the committee which collected evidence against the Councils of York and of the Marshes, and of the committee which was appointed to consider the advisability of remodelling the government of the church. He went entirely with the popular party in their condemnation of ship-money; and it was largely through the earnest speech which Hyde delivered against him that Lord Keeper Finch was driven into exile. When, however, Episcopacy was threatened, and it became apparent that the popular leaders were not to be satisfied with merely temporary reform, but were resolved on gaining a permanent triumph, Hyde, in perfect accordance with both his religious and his political principles, went over to the royalist party. He uttered an open and determined protest against the Grand Remonstrance, and drew up an answer to it which was adopted and published by the king, and

which procured for him the offer of the post of solicitor-general. This he declined; but he complied with the request that he would watch over his Majesty's interests in the House of Commons, in conjunction with Falkland and Colepepper. The king's deepest policy, however, was not disclosed to him, and there is no reason to doubt that the arrest of the five members surprised him as much as he professes. After the retreat of Charles from London, Hyde remained for some weeks in his seat in the Commons, maintaining constant but secret communication with the court; but in May, having been summoned by the king, and being besides alarmed for his own safety, he fled to York. In March 1643 he was made chancellor of the exchequer. He was also chosen one of the royal commissioners at Uxbridge, and was employed in many other matters of importance; and the most persuasive and dignified of the state papers on the royalist side are from his pen.

In 1645, after the final ruin of the king's cause at Naseby, Hyde was appointed, with Lord Capel, Lord Hopton, and Sir John Colepepper, to watch over the safety of the prince of Wales. In the spring of the next year they were compelled to take refuge in Scilly, whence, after six weeks' stay, they passed to Jersey. Soon the prince was called by his mother to Paris, against the will of the council, none of whom accompanied him except Colepepper. Hyde resided at Jersey for nearly two years, solacing himself by studying the Psalms and recording the meditations which they suggested, and also by composing the first four books of his greatest work, the *History of the Rebellion*. In April 1648 he drew up an answer to the ordinance which had been issued by the parliament declaring the king guilty of the civil war, and forbidding all future addresses to him. At length, in May, his attendance was required by the prince, who about this time assumed the command of the seventeen ships which had gone over to his side; but various accidents, of which the most serious was his capture by privateers, prevented him from meeting Charles till August, when he found him at Dunkirk.

In the agreement with the Covenanters and in the Scottish expedition of 1649 Hyde had no share, as he was then absent with Lord Cottington on a fruitless embassy to Spain. The two years which he passed there were not unpleasantly spent; for he was free from all serious cares, and had little to do but study Spanish etiquette and write his *Animadversions on the Supremacy of the Pope*. In 1651, the slights offered by the Spanish ministers having been crowned by a request that he would leave the country, he rejoined Charles at Paris. During the nine weary years which had to elapse before the Restoration he was not the least unfortunate of the exiles. It was no easy matter to fulfil the duty which his office imposed upon him of supplying the wants of his careless master; and his family and himself were often scarcely able to procure the necessaries of life. Besides, he was far from popular. His attachment to the English church, admitting of compromise with no other sect, brought upon him the aversion alike of the Presbyterians and of the queen and the Papists. Charles, however, was wise enough to appreciate his disinterested fidelity. He was recognized as chief adviser of the king, and all state papers were drawn up by him; he conducted the correspondence with the English Royalists; and, in 1658, the dignity of lord chancellor was conferred upon him.

On the Restoration, Hyde retained his posts of lord chancellor and chancellor of the exchequer, and at once assumed the direction of the Government. What the Episcopalian Royalists now required was not so much a leader to stimulate, as a guide to control. Their fervour and their strength were more than sufficient to replace the king firmly on the throne, and to raise

the church to a loftier position than it had ever before attained. The parliament hastened to restore to the Crown the command of the militia, to repeal the Triennial Act, and to vote a revenue of £1,200,000. The Corporation Act, the Act of Uniformity, and the Five Mile Act avenged the church on her enemies, and forced all but the most determined of the clergy into her ranks. Thousands showed as much enthusiasm for monarchy as Hyde himself, and he was no longer the most Episcopalian of Episcopals. To some extent, if not to as great an extent as was to be desired, he has the credit of having restrained his party from too insolent a triumph. Desirous as he was of the re-establishment of the full royal prerogative, he had no wish to see it transgress the limits which he believed to be assigned to it by the constitution, for which he cherished the true lawyer's reverence. Strongly as he held that all were guilty who had in any way countenanced the government of Cromwell, he was statesman enough to see that it was necessary to carry out the Declaration of Breda by pressing the Acts of Oblivion and Indemnity on the reluctant parliament. On the other hand, with regard to the triumph of the church over dissent, if he was somewhat alarmed at its completeness, his fear arose from no pity for the dissenters. His opinion of them, and of the policy which ought to be observed towards them, is emphatically stated in his *Life* (vol. ii. p. 121):—"Their faction is their religion; nor are those combinations ever entered into upon real and substantial motives of conscience, how erroneous soever, but consist of many glutinous materials of will, and humour, and folly, and knavery, and ambition, and malice, which make men cling inseparably together, till they have satisfaction in all their pretences, or till they are absolutely broken and subdued, which may always be more reasonably done than the other."

But, notwithstanding his exaggerated reverence for the sovereign, his passionate attachment to the church, and his real worth, Hyde rapidly became the most unpopular man in the kingdom. The settlement of landed property which had been made by the Act of Indemnity deeply offended hundreds of the cavaliers; for, while it restored all they had lost to those who, like Hyde himself, had both escaped the necessity of selling their land and refused to bow to the government of Cromwell, it did nothing for those who had sold their property, even though they had ruined themselves to support the cause of the king. By the people, who had no means of judging for what he was responsible and of what he was innocent, he was blamed for every misfortune. The sale of Dunkirk was the chief crime with which they charged him; but there is no reason to disbelieve his own declaration that he was at first opposed to the scheme, while it must be allowed that there is force in his excuses that the fortress was expensive to maintain, that the money offered for it was sorely needed, and that its worth to England was by no means great. Still its surrender was a great political mistake; it displayed to the popular eye in far too striking a light the difference between the government of Clarendon and the government of Cromwell. He was also held responsible for the marriage of the king with the childless and Catholic princess of Portugal, and he was even accused of having selected her in order that his own descendants might inherit the throne. And, though his worst political weakness—his allowing Charles to accept the bribes of France—was not then made known, it was the general belief that his splendid mansion in Piccadilly had been erected with foreign gold. Of all dissenters, Catholic and Protestant, his bitter dislike had made determined enemies; and his repellent hauteur, his somewhat conceited austerity, offended the courtiers, and aroused their derision. All these enemies, however, he could afford to scorn so long

as he retained the regard of the king, who, to do him justice, was unusually mindful of his debts to Hyde. In 1661 the chancellor, on the disclosure of the marriage of his daughter to the duke of York, was created Baron Hyde of Hindon, and shortly after earl of Clarendon, at the same time receiving a gift of £20,000; he had already refused the offer of a garter and 10,000 acres. Two years later the attempt to impeach him, made by the earl of Bristol, resulted in a miserable failure, and the accuser sought safety in flight. But in 1667 a second impeachment found him powerless to resist. His dignified censoriousness must always have been disagreeable to the king, who was also annoyed by his strenuous opposition to every scheme for tolerating the Catholics; and when Clarendon ventured to thwart his plans and interfere with his pleasures, annoyance was turned into hatred. Charles, having become enamoured of Miss Fanny Stewart, resolved to marry her, and therefore determined to effect a divorce from the queen. This scheme, which threatened to exclude his descendants from the throne, Clarendon was told enough to oppose; and it was insinuated by his enemies that the marriage of Miss Stewart to the duke of Richmond, which put an end to the project, had been brought about partly by his contrivance. Misfortunes now pressed thick upon him. About the middle of 1667 his wife died; and a few days after the duke of York was sent to him with a message requesting him to resign the chancellorship. This he could not be persuaded to do; he so far forgot his dignity as to plead personally with his master to be allowed to retain his office; and he also addressed to him a humble letter, in which he denied that he had been in any way concerned with Miss Stewart's marriage, and declared that he had no acquaintance with either herself or her husband. But his humiliation was in vain; and on the 30th of August Secretary Morrice was sent to take from him the great seal. On the 6th November the Commons drew up seventeen articles of impeachment against him. It would not have been easy to convict him of high treason. Several of the charges were exaggerated, and one or two were altogether false; there were some, however, sufficiently serious. The chief articles were:—that he had sought to govern by means of a standing army, and without parliament; that he had confined prisoners uncondemned in places where they could not appeal to the law; that he had sold Dunkirk; that he had made a sale of offices, and obtained money by means of his position in various illegal ways; that he had introduced arbitrary government into the colonies; and that he had deceived the king with regard to foreign affairs, and had betrayed his plans to the enemy. It was, however, a general charge of high treason, without specified grounds, which was presented to the Lords, and this they refused to accept. Nevertheless it became plain even to Clarendon himself that he was deserted, and that his cause was hopeless. On the 29th November 1667 he left England for ever, after addressing a vindication of his conduct to the Lords, which, being communicated to the Commons, was voted seditious, and burned by the hangman. A bill of attainder was brought in against him, but the Lords rejected it; and the matter was finally compromised by the passing of an Act which condemned him to perpetual banishment, unless he should appear for trial within six weeks.

Meanwhile, sick in body and in mind, he had landed in France; but, before reaching Rouen, he was stopped, and informed that he could not be allowed to remain in the country. After several refusals, however, permission to stay was granted; and he was conducted to Avignon by a French officer. At Evreux an incident occurred which shows the bitterness of the feeling with which he was regarded by his countrymen. A party of English sailors who happened to be working in the town, on hearing of

his arrival, broke into his bed-room, burst open his trunks, attacked and wounded him with their swords, and were only prevented from murdering him by the arrival of a body of French troops. From Avignon he passed to Montpellier; and the rest of his life was spent chiefly in this town and in Rouen. His time was thenceforth passed in the quiet pursuit of literature. He resumed his *Meditations on the Psalms*, concluded his *History of the Rebellion*, and wrote his *Life, A Short View of the State of Ireland*, most of his *Essays*, and his *Survey of Hobbes's Leviathan*. Twice he humbly appealed to Charles that he might be allowed to die in his native land; but not even a reply was vouchsafed, and it was at Rouen that he expired on the 9th December 1674.

The character of Clarendon is well-marked. In the court of Charles II. he was almost the only man who lived chastely, drank moderately, and swore not at all. Three principles guided his life. The first, from which he never swerved, was a passionate attachment to the religion and polity of the Church of England. The second, to which he was faithful on the whole, though with some declensions, was the determination to maintain what he regarded as the true and ideal English constitution. The third, which he more than once nobly sacrificed to the other two, was a desire for personal advancement. In political practice he sadly wanted both insight and tact, and, though he could plead most cleverly and affectingly in a state paper, he was too apt, when confronted by opposition in Parliament, to lose his temper. He was, however, ready in debate; he could speak well; and for business he was admirably adapted. In political theory he was intensely conservative; no royalist squire who had never seen the king but in moments of dignified ceremony could have cherished a deeper reverence for him than did this courtier, who had watched his every act of crime and selfishness. Cold and haughty as he was towards his equals, at least in the end of his life, in his bearing towards the royal family, he sometimes appeared to abjure every feeling of manly independence. On two occasions this was miserably exemplified. He was too proud to allow his own wife to visit any woman of disreputable character, whatever her position; yet, at the command of his master, he was base enough to urge the queen to admit her husband's favourite mistress as one of her ladies in waiting. And there is another scene in which we cannot help regarding him with still deeper scorn. In his *Life* he calmly tells us the story. About the time of the Restoration the duke of York had fallen in love with his eldest daughter, Anne Hyde, and before their intimacy had been discovered had given her a written promise of marriage. Of this Clarendon professes to have been completely ignorant; and when the affair could no longer be concealed, he tells us he was the last to be informed of it. Nor is this surprising if his own account of the manner in which he received the news is to be credited in the least. He broke into "a very immoderate passion." He would turn his daughter from his house. He hoped she was the duke's mistress, and not his wife, for then he could refuse to harbour her. He would have her sent to the Tower; he would have an Act passed to execute her; nay, he would be the first to propose such an Act. "Whoever knew the man," he adds, "will know that he said all this very heartily." Modern historians are perhaps too kind in doubting him. Soon after he told the king that he "so much abominated" the thought of his daughter's becoming the wife of the prince, that he "had much rather see her dead, with all the infamy that is due to her presumption." He even informed the duke himself—when an infamous conspiracy was hatched against her honour, and Sir Charles Berkeley swore that she had granted him favours incon-

sistent with her duty to her husband—that since she had deceived himself he could not answer for her fidelity to any other man. The conclusion of the affair displays a depth of meanness which could not have been credited on any other testimony than his own. In fear of death Mary of Orange confessed that the accusation was false, and Berkley admitted his perjury; but in Clarendon's breast there does not appear to have been kindled a spark of the burning indignation which an honourable stranger could not have repressed; Berkley himself had only to ask forgiveness. It is possible that this humiliating story—this basest display of the “besotted loyalty” of the time, is altogether true. Much of it is beyond denial; and if we hold that in the rest Clarendon was merely acting a part, we miserably save a very small portion of his manliness at the expense of all his sincerity.

It is in literature that Clarendon's name best deserves to be remembered. His *Essays* (which are chiefly didactic) and his *Survey of Hobbes's Leviathan* scarcely rise above the commonplace, but his *History of the Rebellion* and his *Life of Edward, Earl of Clarendon* have a high and permanent value. That he was a historian of wide grasp and deep insight cannot be maintained; his works are professedly pleadings on behalf of the Episcopalian Royalists and himself; but, though it would be too much to allege that his accuracy is never warped by his purpose, we may in general accept his statements of fact as correct. It is, however, as works of literary art that his histories have attained to the position they hold. They charm us by their calm and never-failing grace, by their quiet humour, by their general tone of lofty dignity, but perhaps most of all by the exquisite portraits which they contain. It is true he cannot penetrate to the innermost recesses of men's souls, and let us read the motives of their lives; but he can introduce them to us, as it were, in society, can let us observe their career, watch their humours, and listen to their talk. Clarendon's style, too, though extremely loose and often amusingly ungrammatical, has many beauties. His sentences are of extraordinary length, and usually contain numerous involved parentheses; but while these qualities threaten obscurity, obscurity is always avoided; and they have the merit of enabling the writer to produce a slow, stately, graceful music, of which the short sentence is altogether incapable. (T. M. W.)

CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, FOURTH EARL of, diplomatist and statesman, was born in London 12th January 1800, and died 27th June 1870. He was the eldest son of the Honourable George Villiers, brother of the third earl of Clarendon (second creation), by Theresa, only daughter of the first Lord Boringdon, and granddaughter of the first Lord Grantham. The earldom of the Lord Chancellor Clarendon became extinct in 1756 by the death of the fourth earl, his last male descendant. Jane Hyde, countess of Essex, the sister of that nobleman (who died in 1724), left two daughters; of these the eldest, Lady Charlotte, became heiress of the Hyde family. She married Thomas Villiers, second son of the second earl of Jersey, who served with distinction as English minister in Germany, and in 1776 the earldom of Clarendon was revived in his favour. The connection with the Hyde family was therefore in the female line and somewhat remote. But a portion of the pictures and plate of the great chancellor was preserved to this branch of the family, and remains at the Grove, their family seat at Hertfordshire, to this day.

Young George Villiers, the subject of this notice, entered upon life under circumstances which gave small promise of the brilliancy of his future career. He was well born; he was heir presumptive to an earldom; and his mother was a woman of great energy, admirable good sense, and high feeling. But the means of his family were contracted;

his education was desultory and incomplete; he had not the advantages of a training either at a public school or in the House of Commons. He went up to Cambridge at the early age of sixteen, and entered St John's College on the 29th June 1816. In 1820, as the eldest son of an earl's brother with royal descent, he was enabled to take his M.A. degree under the statutes of the university then in force; and in the same year he was appointed attaché to the British embassy at St Petersburg, where he remained three years, and acquired that practical knowledge of the business of diplomacy which was of so much use to him in after-life. He had received from nature a singularly handsome person, a polished and engaging address, a ready command of languages, and a remarkable power of composition.

Upon his return to England in 1823, Mr Villiers was appointed to a commissionership of customs, an office which he retained for about ten years. Part of this time was spent in Ireland in the work of fusing the revenue boards of England and Ireland into those of the United Kingdom. It was the period of the liveliest excitement that preceded Catholic Emancipation, and the young English official incurred the censure of the Tory Government of the day for having presumed to cultivate the acquaintance of the most accomplished of the Catholic leaders. These official duties trained Mr Villiers in the business of civil administration, and likewise enabled him to acquire some useful experience of the Irish character. In 1831 he was despatched to France to negotiate a commercial treaty, which, however, led to no result.

The time was come which was to open to him a wider and more congenial field of action in the politics of Europe. On the 16th of August 1833 Mr Villiers was appointed minister at the court of Spain. Ferdinand VII. died within a month of his arrival at Madrid, and the infant queen Isabella, then in the third year of her age, was placed by the old Spanish law of female inheritance on her contested throne. Don Carlos, the late king's brother, claimed the crown by virtue of the Salic law of the House of Bourbon which Ferdinand had renounced before the birth of his daughter. Isabella II. and her mother Christina, the queen regent, became the representatives of constitutional monarchy, Don Carlos of Catholic absolutism. The conflict which had divided the despotic and the constitutional powers of Europe since the French Revolution of 1830 broke out into civil war in Spain, and by the Quadruple Treaty, signed on April 22, 1834, France and England pledged themselves to the defence of the constitutional thrones of Spain and Portugal. For six years Mr Villiers continued to give the most active and intelligent support to the Liberal Government of Spain. He was accused, though unjustly, of having favoured the revolution of La Granja, which drove Christina, the queen mother, out of the kingdom, and raised Espartero to the regency. He undoubtedly supported the chiefs of the Liberal party, such as Olozaga and Espartero against the intrigues of the French Court; but the object of the British Government was to establish the throne of Isabella on a truly national and liberal basis and to avert those complications, dictated by foreign influence, which eventually proved so fatal to that princess. Spain never forgot what she owed in those years to the youthful and energetic minister of Great Britain, and he, on his part, retained a cordial interest in her welfare. He received the Grand Cross of the Bath in 1838 in acknowledgment of his services, and succeeded, on the death of his uncle, to the title of earl of Clarendon; in the following year, having left Madrid, he married Katharine, eldest daughter of James Walter, first earl of Verulam.

In January 1840 he entered Lord Melbourne's administration as Lord Privy Seal, and from the death of Lord Holland in the autumn of that year, Lord Clarendon also held the office of Chancellor of the Duchy of Lancaster until the dissolution of the ministry in 1841. In this capacity he made his first appearance in parliament, and although he always regretted the want of a previous training in the House of Commons, he was from the first listened to by the House of Peers as a speaker well qualified to assist the deliberations of parliament on questions of foreign policy. But on these questions he was not heartily united with the spirit that then animated the Foreign Office. Deeply convinced that the maintenance of a cordial understanding with France was the most essential condition of peace and of a liberal policy in Europe, he reluctantly concurred in the measures proposed by Lord Palmerston for the expulsion of the pasha of Egypt from Syria; he strenuously advocated, with Lord Holland, a more conciliatory policy towards France; and he was only restrained from sending in his resignation by the dislike L. Palmerston's policy (as is shown by his own published letters) was constantly governed by the belief that France must be regarded by England as a rival and an enemy, with whom war was, sooner or

later, inevitable. Lord Clarendon, on the contrary, regarded France as a rival, but a friend; he relied on the good sense and common interests of the two nations to maintain amicable relations; and he succeeded in drawing closer for a period of thirty years, from 1840 to 1870, the ties which still happily remain unbroken between them. That was his great object, and the proudest result of his political life; and the difficulties he had to encounter were at times as great on his own side of the Channel as on the other.

The interval of Sir Robert Peel's great administration (1841-1846) was to the leaders of the Whig party a period of repose; but Lord Clarendon took the warmest interest in the progressive triumph of the principles of free trade and in the ultimate repeal of the corn-laws, of which his brother, Mr Charles Pelham Villiers, had been the earliest, the most constant, and the most able advocate. For this reason, upon the formation of Lord John Russell's first administration, Lord Clarendon accepted the office of President of the Board of Trade. Twice in his career the Governor-Generalship of India was offered him, and once the Governor-Generalship of Canada;—these he refused from reluctance to withdraw from the politics of Europe. But in 1847 a sense of duty compelled him to take a far more laborious and uncongenial appointment. The desire of the cabinet was to abolish the Lord Lieutenantcy of Ireland, and Lord Clarendon was prevailed upon to accept that office, with a view to transform it ere long into an Irish Secretaryship of State. But he had not been many months in Dublin before he acknowledged that the difficulties then existing in Ireland could only be met by the most vigilant and energetic authority, exercised on the spot. The crisis was one of extraordinary peril. Agrarian crimes of horrible atrocity had increased threefold. The Catholic clergy were openly disaffected. This was the second year of a famine which had desolated Ireland. The population, decimated by starvation and disease, lived upon the poor-rate and the alms of England, and extraordinary measures were required to regulate the bounty of the Government and the nation. In 1848 the French Revolution let loose fresh elements of discord, which culminated in an abortive insurrection, and for a lengthened period Ireland was a prey to more than her wonted symptoms of disaffection and disorder. During those five years Lord Clarendon held the reins of the vice-regal government; a task more entirely repugnant to his own predilections and more certain to be repaid with unmerited obloquy could not have been imposed upon him. But he bore up against that flood of hostile passions and difficulties with unshaken firmness. He fed the starving; he subdued the factious; he crushed the rebellious. He left behind him permanent marks of improvement in the legislation of Ireland; and he practised, as far as possible, the broadest toleration of races and of creeds. If any name is associated in Ireland with the recollection of a government at once firm, far-sighted, and liberal, it should be that of Lord Clarendon. His services were expressly acknowledged by her Majesty in the Speech to both Houses of Parliament from the throne, on September 5, 1848,—this being the first time that any *civil* services obtained that honour; and he was made a Knight of the Garter (retaining also the Grand Cross of the Bath by special order of her Majesty) on the 23d March 1849. Looking back to that period, after an interval of more than twenty years, it must be acknowledged that from this crisis dates the regeneration of Ireland. The population, reduced in numbers, has never ceased to advance in prosperity; wages have risen; the land has been freed from secular incumbrances; crime has diminished; and treason itself has never recovered the crushing defeat of Smith O'Brien and Meagher. Lord Clarendon had a large share in promoting these results; but he hailed with no common satisfaction the change of Government which released him from those arduous duties in 1852.

Upon the formation of the coalition ministry between the Whigs and the Peelites, in 1853, under Lord Aberdeen, the premier placed, without hesitation, the foreign office in the hands of Lord Clarendon; but incredulous himself of the peril of war, which was already casting its dark shadow over the East, Lord Aberdeen sought rather to check than to stimulate the decisions which might possibly have arrested the course of hostilities. It can hardly now be doubted that the hesitation which appeared to mark the successive steps of the Western allies encouraged the czar to more daring aggressions; and Lord Clarendon confessed, in an expression which was never forgotten, that we "drifted" into war, which a more prompt defiance and an open alliance between the Western powers and the Porte might have arrested. But the war once begun Lord Clarendon continually urged the prosecution of it with the greatest energy. He employed every means in his power to stimulate and assist the war departments, and above all he maintained the closest relations with our French allies, on whose co-

operation everything depended. The Emperor Nicholas had speculated on the impossibility of the sustained joint action of France and England in council and in the field. It was mainly by Lord Clarendon at Whitehall and by Lord Raglan before Sebastopol that such a combination was rendered practicable, and did eventually triumph over the enemy. The diplomatic conduct of such an alliance for three years between two great nations jealous of their military honour and fighting for no separate political advantage, tried by excessive hardships and at moments on the verge of defeat, was certainly one of the most arduous duties ever performed by a minister. No one will ever know all the labour it cost; but the result was due in the main to the confidence with which Lord Clarendon had inspired the emperor of the French, and to the affection and regard of the empress, whom he had known in Spain from her childhood.

In 1856 Lord Clarendon took his seat at the Congress of Paris convoked for the restoration of peace, as first British Plenipotentiary, invested with full powers. It was the first time since the appearance of Lord Castlereagh at Vienna that a secretary of state for foreign affairs had been present in person at a congress on the Continent. Lord Clarendon's first care was to obtain the admission of Italy to the council chamber as a belligerent power, and to raise the barrier which still excluded Prussia as a neutral one. But in the general anxiety of all the powers to terminate the war there was no small danger that the objects for which it had been undertaken would be abandoned or forgotten. It is due, we may say, entirely to the firmness of Lord Clarendon that the principle of the neutralization of the Black Sea was preserved, that the Russian attempt to trick the allies out of the cession in Bessarabia was defeated, and that the results of the war were for a time secured.¹ The Congress was eager to turn to other subjects, and perhaps the most important result of its deliberations was the celebrated Declaration of the Maritime Powers, which abolished privateering, defined the right of blockade, and limited the right of capture to enemy's property in enemy's ships. Lord Clarendon has been accused of an abandonment of what are termed the belligerent rights of this country, which were undoubtedly based on the old maritime laws of Europe. But he acted in strict conformity with the views of the British cabinet, and the British cabinet adopted those views because it was satisfied that it was not for the benefit of the country to adhere to practices which exposed the vast mercantile interests of Britain to depredation, even by the cruisers of a secondary maritime power, and which, if vigorously enforced against neutrals, could not fail to embroil her with every maritime state in the world. The experience of 1780, when the armed neutrality of the North reacted so fatally on the American war, is the most conclusive demonstration of the fatal results of such a system of policy; and the more enlightened views of the present day have shown that a commercial belligerent nation would lose far more than she would gain by the suppression of the neutral trade, even if such a suppression were possible.

Upon the reconstitution of the Whig administration in

¹ The Crimean War and the peace of 1856 had results highly beneficial to the politics of Europe. They rescued Turkey from the inimical grasp of Russia, and gave to the Ottoman empire twenty years of peace and security, which might, under abler rulers, have restored it to real independence and prosperity. They overthrew the preponderance which the Emperor Nicholas had asserted in Europe; they cemented the alliance of France and England; and they led the way to the subsequent changes which followed in Italy and Germany. These were all objects which Lord Clarendon had at heart, and although no minister can hope to have a permanent influence on the course of human affairs, the events of the last twenty-five years have not been uninfluenced by his liberal and conciliatory views.

1859, Lord John Russell made it a condition of his acceptance of office under Lord Palmerston that the Foreign Department should be placed in his own hands, which implied that Lord Clarendon should be excluded from office, as it would have been inconsistent alike with his dignity and his tastes to fill any other post in the Government. The consequence was that from 1859 till 1864 Lord Clarendon remained out of office, and the critical relations arising out of the civil war in the United States were left to the guidance of Earl Russell. But he re-entered the cabinet in May 1864 as Chancellor of the Duchy of Lancaster; and upon the death of Lord Palmerston in 1865, Lord Russell again became prime minister, when Lord Clarendon returned to the Foreign Office, which was again confided to him for the third time upon the formation of Mr Gladstone's administration in 1868. To the last moment of his existence, Lord Clarendon continued to devote every faculty of his mind and every instant of his life to the public service; and he expired surrounded by the boxes and papers of his office on the 27th June 1870, within a few days of that great catastrophe which was about to change the face of Europe, and which he, if any body, might possibly have retarded or averted. His death called forth expressions of the deepest sympathy and regret from all the courts and statesmen of both hemispheres; and these manifestations of more than official sorrow were collected and laid before parliament by order of the Queen. This is not the place to enlarge on the charm of Lord Clarendon's personal demeanour, or on the playfulness and grace he threw over the conduct of great affairs. We must content ourselves with a brief record of what he did in public life. But no man owed more to the influence of a generous, unselfish, and liberal disposition. If he had rivals he never ceased to treat them with the consideration and confidence of friends, and he cared but little for the ordinary prizes of ambition in comparison with the advancement of the great cause of peace and progress in the world.

A notice of Lord Clarendon, by a friendly hand, was printed in *Fraser's Magazine* for August 1870, from which we have borrowed some details. No other biography of this eminent and accomplished statesman has been published. (H. R.)

CLARI, GIOVANNI CARLO MARIA, chapel-master at Pistoia, was born at Pisa in 1669. The time of his death is unknown. He was the most celebrated pupil of Colonna, chapel-master of S. Petronio, at Bologna. The works by which Clari distinguished himself pre-eminently are his vocal duets and trios, with a continued bass, published in 1720. In these beautiful and learned compositions the tonal responses and modulations are in the modern style. An edition of these duets and trios, with a pianoforte accompaniment, was published at Paris in 1823, by Mirecki, a Polish musician, and a pupil of Cherubini. In such esteem were these compositions held by Cherubini, that, in the course of his studies, he repeatedly transcribed them with his own hand, as models of excellence. Clari composed one opera, *Il Savio Delirante*, and for the church a *Stabat* and four other works.

CLARINET. See OBOE.

CLARK, SIR JAMES (1788–1870), an English physician, was born at Cullen, in Banffshire. He was educated at the grammar-school of Fordyce, and at the universities of Aberdeen and Edinburgh, at the former of which he took the degree of M.A., at the latter that of M.D. He served for six years as a surgeon in the navy; he then spent some time in travelling on the Continent, in order to investigate the effects of the mineral waters and the climate of various places commonly recommended to invalids; and for eight years he was settled at Rome. In 1824 he was chosen physician to Prince Leopold of Saxe-Coburg, and two years after he commenced to practise in London as physician to

the St George's Parochial Infirmary. He was elected a fellow of the Royal Society in 1832; in 1835 he was appointed physician to the Duchess of Kent and the Princess Victoria, and on the accession of the latter to the throne he became physician in ordinary to the Queen. On the foundation of the university of London, he was made a member of its senate; and he belonged to many medical societies both at home and abroad. In 1838 he was created baronet. Sir James Clark made a special study of sanatory science, and he was also regarded as an authority on diseases of the lungs. He published—*Medical Notes*; *The Sanative Influence of Climate*, containing valuable meteorological tables; *A Treatise on Pulmonary Consumption and Scrofulous Disease*; and *Clinical Instruction*.

CLARK, THOMAS (1801–1867), a distinguished chemist, was born at Ayr, on the 31st March 1801. His father was captain of a merchant vessel, and his mother began the Ayrshire needlework. He was educated at the Ayr Academy, a school of great efficiency and repute. In 1816 he entered the counting-house of Charles Macintosh & Co. the inventors of the waterproof cloth, but soon obtained the more congenial situation of chemist in Tennant's chemical works at St Rollox. In 1826 he was appointed lecturer on chemistry to the Glasgow mechanics' institution, where he propounded advanced views on the atomic theory and the theory of salts. The same year he published his first papers, containing his discovery of the pyrophosphate of soda, which was a turning-point in chemical history. Becoming a medical student in the university of Glasgow, he took the degree of M.D. in 1831. He was for several years apothecary to the Glasgow infirmary, and published several important papers on pharmacy. In 1832 he published in the *Westminster Review* an elaborate inquiry into the existing system of weights and measures. In 1833 he obtained by competition the chair of chemistry in Marischal College, Aberdeen. About the same time he matured two important practical researches relating to the construction of hydrometers and the means of detecting arsenic. In 1835 he published a paper on the "Application of the Hot-Blast," explaining the principle of its efficacy. In 1836 appeared his letter to Mitscherlich on the Oxygen Salts. Clark's name became most generally known in connection with his water tests and his process for softening hard (chalk) waters. These came out in 1841. The tests have been in use ever since; and the softening process intended for the London waters, but not as yet adopted by any of the London companies, has been very successfully carried out in several places. In 1844 his health gave way under mental strain, and he ceased to be able to lecture to his class. Being removed also from his laboratory, he did little more chemical work, except directing his assistant in perfecting his water tests. His active mind, however, could not rest, and he took up several inquiries, the last of all, which occupied what strength he had for nearly twenty years before his death, being the historical origin of the Gospels. Proceeding from one stage to another, he finally concentrated his energies on an attempt to settle the true readings of the Greek text of the three first Gospels. His mode of proceeding displayed the peculiar sagacity and tact shown in his scientific inventions, and his results had reached a form admitting of publication at the time of his death. The work would have been very valuable in connection with the revision of the Bible, and it is to be regretted that his surviving relatives did not see fit to publish it. Clark took a leading part in all the discussions relating to the improvement of the university of Aberdeen. He was an admirable lecturer, but unfortunately his teaching career was short. He died at Glasgow on the 27th November 1867.

CLARKE, ADAM (c. 1760–1832), a Wesleyan divine, distinguished for his varied learning, was born at Moybeg, in

the north of Ireland in 1760 or 1762. After receiving a very limited education he was apprenticed to a linen manufacturer, but, finding the employment uncongenial, he soon abandoned it, and devoted himself to study. His parents belonged to a Methodist congregation under the pastoral charge of Breedon, one of Wesley's earliest associates in the Methodist movement, by whose advice young Clarke was sent to the school founded by Wesley at Kingswood, near Bristol. In 1782 he entered on the duties of the ministry, being appointed by Wesley to the Bradford (Wiltshire) circuit. His popularity as a preacher was very great, and his influence in the denomination is indicated by the fact that he was three times chosen to be president of the Conference. He served twice on the London circuit, the second period being extended considerably longer than the rule allowed, at the special request of the British and Foreign Bible Society, who had employed him in the preparation of their Arabic Bible. He had found time during his itinerancy for diligent study of Hebrew and other Oriental languages, undertaken chiefly with the view of qualifying himself for the great work of his life, his *Commentary on the Holy Scriptures*, the first volume of which appeared in 1810, and the eighth and last in 1826. It is a work of much learning and ability, and it still possesses some value, though it is in great part superseded by the results of later scholarship. Dr Clarke's other literary works were very numerous. In 1802 he published a *Bibliographical Dictionary* in six volumes, to which he afterwards added a supplement. He was selected by the Records Commission to edit Rymer's *Fœdera*, a task for which he was not well qualified, and which he did not complete. He also wrote *Memoirs of the Wesley Family* (1823), and edited a large number of religious works. He died of cholera in London on the 16th August 1832. His Miscellaneous Works have been published in a collected form in 13 vols., and a Life by J. B. B. Clarke appeared in 1833.

CLARKE, EDWARD DANIEL (1769-1822), LL.D., an English traveller, was born at Willingdon, Sussex, June 5, 1769. In 1786 he obtained the office of chapel clerk at Jesus College, Cambridge, but the loss of his father at this time involved him in many difficulties. In 1790 he took his degree, and soon after became private tutor to the Honourable Henry Tufton, nephew of the duke of Dorset. In 1792 he obtained an engagement to travel with Lord Berwick through Germany, Switzerland, and Italy. After crossing the Alps, and visiting a few of the principal cities of Italy, including Rome, he repaired to Naples, where he remained nearly two years. Having returned to England in the summer of 1794, he became tutor in several distinguished families. In 1799 he set out with a Mr Cripps, on a tour through the Continent of Europe, commencing with Norway and Sweden, whence they proceeded through Russia and the Crimea to Constantinople, Rhodes, and afterwards to Egypt and Palestine. After the capitulation of Alexandria, Clarke was of considerable use in securing for England the statues, sarcophagi, maps, manuscripts, &c., which had been collected by the French savans. Greece was the country next visited. From Athens the travellers proceeded by land to Constantinople, and after a short stay in that city, directed their course homewards through Rumelia, Austria, Germany, and France. Clarke, who had now obtained considerable reputation, took up his residence at Cambridge, and there he continued chiefly to reside till the day of his death. He received the degree of LL.D. shortly after his return, on account of the valuable donations, including a colossal statue of the Eleusinian Ceres, which he had made to the university. He was also presented to the college living of Harlton, to which, four years later, his father-in-law added that of Yeldham. Towards the end of 1808 Clarke was

appointed to the professorship of mineralogy, then first instituted. Nor was his perseverance as a traveller otherwise unrewarded. The MSS. which he had collected in the course of his travels were sold to the Bodleian Library for £1000; and by the publication of his travels he realized altogether a clear profit of £6595. Besides lecturing on mineralogy and discharging his clerical duties, Dr Clarke eagerly prosecuted the study of chemistry, and made several discoveries, principally by means of the gas blowpipe, which he had brought to a high degree of perfection. His health gave way under too ardent study; and after a short illness he expired at London, March 9, 1822. In all the relations of life Dr Clarke was a most amiable man; and his enthusiasm was united with a great capacity for enduring long-continued exertion, both mental and physical. The following is a list of his principal works:—

Testimony of Authors respecting the Colossal Statue of Ceres in the Public Library, Cambridge, 8vo, 1801-3; *The Tomb of Alexander, a Dissertation on the Sarcophagus brought from Alexandria, and now in the British Museum*, 4to, 1805; *A Methodical Distribution of the Mineral Kingdom*, fol., 1807; *A Description of the Greek Marbles brought from the Shores of the Euxine, Archipelago, and Mediterranean, and deposited in the University Library, Cambridge*, 8vo, 1809; *Travels in various Countries of Europe, Asia, and Africa*, 4to, 1810-1819.

CLARKE, DR SAMUEL (1675-1729), a celebrated English philosopher and divine, was the son of Edward Clarke, alderman of Norwich, who had represented that city in parliament for several years. He was born October 11, 1675; and having finished his education at the free school of Norwich in 1691, removed thence to Caius College, Cambridge, where his uncommon abilities soon began to display themselves. Though the philosophy of Descartes was at that time the reigning system at the university, yet Clarke easily mastered the new system of Newton, and contributed greatly to the spread of the Newtonian philosophy by publishing an excellent translation of Rohault's *Physics* with notes, which he finished before he was twenty-two years of age. The system of Rohault was founded entirely upon Cartesian principles, and was previously known only through the medium of a rude Latin version. Clarke not only gave a new translation, but added to it such notes as were calculated to lead students insensibly to other and truer notions of science. "The success," says Bishop Hoadley, "answered exceedingly well to his hopes; and he may justly be styled a great benefactor to the university in this attempt." It continued to be used as a text-book in the university till supplanted by the treatises of Newton, which it had been designed to introduce. Whiston relates that, in 1697, he met young Clarke (at that time chaplain to Moore, bishop of Norwich), then wholly unknown to him, at a coffee-house in that city, where they entered into conversation about the Cartesian philosophy, particularly Rohault's *Physics*, which Clarke's tutor, as he tells us, had put him upon translating. "The result of this conversation was," says Whiston, "that I was greatly surprised that so young a man as Clarke then was should know so much of those sublime discoveries, which were then almost a secret to all but to a few particular mathematicians. Nor do I remember," continues he, "above one or two at the most, whom I had then met with, that seemed to know so much of that philosophy as Clarke." This translation of Rohault was first printed in 1697, 8vo. There have been four editions of it: the last and best is that of 1718, which has the following title:—*Jacobi Rohaulti Physica. Latine vertit, recensuit, et uberioribus jam Annotationibus, ex illustrissimi Isaaci Newtoni Philosophia maximam partem haustis, amplificavit et ornavit S. Clarke, S.P.T. Accedunt etiam in hac quarta editione novæ aliquot tabulæ æri incisæ et Annotationes multum sunt*

auctæ. It was translated into English by Dr John Clarke, dean of Sarum, and published in two vols. 8vo.

Clarke afterwards turned his thoughts to divinity, and in order to qualify himself for the sacred office, devoted himself to the study of Scripture in the original, and of the primitive Christian writers. Having taken holy orders, he became chaplain to Moore, bishop of Norwich, who was ever afterwards his constant friend and patron. In 1699 he published two treatises,—one entitled *Three Practical Essays on Baptism, Confirmation, and Repentance*, and the other, *Some Reflections on that part of a book called Amyntor, or a Defence of Milton's Life, which relates to the Writings of the Primitive Fathers, and the Canon of the New Testament*. In 1701 he published *A Paraphrase upon the Gospel of St Matthew*, which was followed, in 1702, by the *Paraphrases upon the Gospels of St Mark and St Luke*, and soon afterwards by a third volume upon St John. They were subsequently printed together in two volumes 8vo, and have since passed through several editions. He intended to have treated in the same manner the remaining books of the New Testament, but something accidentally interrupted the execution of his design.

Meanwhile Bishop Moore gave him the rectory of Drayton, near Norwich, and procured him a parish in the city. In 1704 he was appointed to the Boyle lectureship, and chose for his subject the Being and Attributes of God. Having been appointed to the same office in the following year, he chose for his subject the Evidences of Natural and Revealed Religion. These lectures were first printed in two distinct volumes, but were afterwards collected together, and published under the general title of *A Discourse concerning the Being and Attributes of God, the Obligations of Natural Religion, and the Truth and Certainty of the Christian Revelation, in opposition to Hobbes, Spinoza, the author of the Oracles of Reason, and other Deniers of Natural and Revealed Religion*.

In 1706 he wrote a refutation of some positions which had been maintained by Dr Dodwell on the immortality of the soul, and this drew him into controversy with Collins. He also at this time wrote a translation of Newton's Optics, for which the author presented him with £500. In the same year also, through the influence of Bishop Moore, he obtained the rectory of St Bennet's, Paul's Wharf, London; and he soon afterwards appeared at the court of Queen Anne, who appointed him one of her chaplains in ordinary, and afterwards, in 1709, presented him to the rectory of St James's, Westminster. On his elevation to this latter office, he took the degree of doctor in divinity, defending as his thesis the two propositions:—"1. *Nullum fidei Christianæ dogma, in Sacris Scripturis traditum, est rectæ rationi dissentaneum*, no article of the Christian faith, delivered in the Holy Scriptures, is disagreeable to right reason, and 2. *Sine actionum humanarum libertate nulla potest esse religio*, without the liberty of human actions, there can be no religion. During the same year, at the request of the author, he revised and corrected Whiston's English translation of the *Apostolical Constitutions*.

In 1712 he published a carefully punctuated and annotated edition of Cæsar's Commentaries, adorned with elegant engravings. It was printed in folio, 1712, and afterwards in 8vo, 1720, and dedicated to the duke of Marlborough. During the same year he published his celebrated treatise on *The Scripture Doctrine of the Trinity*. It is divided into three parts. The first contains a collection and exegesis of all the texts in the New Testament relating to the doctrine of the Trinity; in the second the doctrine is set forth at large, and explained in particular and distinct propositions; and in the third the principal passages in the liturgy of the Church of England relating to the doctrine of the Trinity are considered. Whiston

informs us that, some time before the publication of this book, a message was sent to him from Lord Godolphin and other ministers of Queen Anne, importing "that the affairs of the public were with difficulty then kept in the hands of those that were for liberty; that it was therefore an unseasonable time for the publication of a book that would make a great noise and disturbance; and that therefore they desired him to forbear till a fitter opportunity should offer itself,"—a message that Clarke of course entirely disregarded. The ministers were right in their conjectures; and the work not only provoked a great number of replies, but occasioned a formal complaint from the Lower House of Convocation. Clarke, in reply, drew up an apologetic preface, and afterwards gave several explanations, which satisfied the Upper House; and on his pledging himself that his future conduct would occasion no trouble, the matter dropped.

In 1715 and 1716 he had a discussion with Leibnitz relative to the principles of natural philosophy and religion, which was at length cut short by the death of his antagonist. A collection of the papers which passed between them was published in 1717. In 1719 he was presented by Lord Lechmere to the mastership of Wigston's hospital in Leicester. In 1724 he published seventeen sermons, eleven of which had not before been printed. In 1727, upon the death of Sir Isaac Newton, he was offered by the court the place of Master of the Mint, worth on an average from £1200 to £1500 a year. This secular preference, however, he absolutely refused,—a circumstance which Whiston regards as "one of the most glorious actions of his life, and affording undeniable conviction that he was in earnest in his religion." In 1728 was published "A Letter from Dr Clarke to Benjamin Hoadley, F.R.S., occasioned by the controversy relating to the Proportion of Velocity and Force in Bodies in Motion," printed in the *Philosophical Transactions*. In 1729 he published the first twelve books of Homer's *Iliad*. This edition was printed in quarto, and dedicated to the duke of Cumberland. "The translation of Homer, who was Clarke's favourite author," says Bishop Hoadley, "with his corrections, may now be styled accurate; and his notes, as far as they go, are indeed a treasury of grammatical and critical knowledge. He was called to his task by royal command, and he has performed it in such a manner as to be worthy of the young prince for whom it was laboured." The year of its publication was the last of Clarke's life. Hitherto, though not robust, he had always enjoyed a firm state of health; but on the morning of Sunday, 11th May 1729, when going out to preach before the judges at Sergeant's Inn, he was seized with a sudden illness, which caused his death on the Saturday morning following. He died, May 17, 1729, in the 54th year of his age.

Soon after his death were published, from his original manuscripts, by his brother Dr John Clarke, dean of Sarum, *An Exposition of the Church Catechism*, and ten volumes of sermons, in 8vo. His *Exposition* is composed of the lectures which he read every Thursday morning, for some months in the year, at St James's church. In the latter part of his life he revised them with great care, and left them completely prepared for the press. Three years after his death appeared also the last twelve books of the *Iliad*, published in 4to by his son Mr Samuel Clarke, the first three of these books and part of the fourth having, as he states, been revised and annotated by his father.

Clarke was of a cheerful and even playful disposition. An intimate friend relates that happening to call for him he found him swimming upon a table. At another time, when Clarke and several other men of ability and learning were indulging in diversion, on looking out at the window he saw a grave blockhead approaching the house; upon which

he cried out, "Boys, boys, be wise; here comes a fool." This turn of his mind is confirmed by Dr Warton, who, in his observations upon the line of Mr Pope,

"Unthought-of frailties cheat us in the wise,"

says, "Who could imagine that Locke was fond of romances; that Newton once studied astrology; that Dr Clarke valued himself on his agility, and frequently amused himself in a private room of his house in leaping over the tables and chairs; and that our author himself was a great epicure?"

[Clarke, although in no department a genius of the first order, was a man of great general ability. He was eminent as a theologian, a mathematician, a metaphysician, and a philologist. His chief strength lay in his logical power. He was so disciplined and skilful a reasoner as to be able to contend on equal terms even with a Butler or a Leibnitz. Few have defended so well so many good causes. The materialism of Hobbes, the pantheism of Spinoza, the empiricism of Locke, the determinism of Leibnitz, Collins's necessitarianism, Dodwell's denial of the natural immortality of the soul, rationalistic attacks on Christianity, and the selfish morality of the sensualists,—all found in him a formidable opponent, possessed of great strength of mind, extraordinary dialectic skill, and a thorough conviction of the importance and truth of the principles which he advocated.

His fame as a theologian and philosopher rests to a large extent on his demonstration of the existence of God and his theory of the foundation of rectitude. The former is not, as it is often described, a purely *a priori* argument, nor is it presented as such by its author. It starts from a fact, and it often explicitly appeals to facts. The intelligence, for example, of the self-existence and original cause of all things—the main question between theists and atheists—is admitted to be "not easily proved *a priori*," but argued to be "demonstrably proved *a posteriori* from the variety and degrees of perfection in things, and the order of causes and effects, from the intelligence that created beings are confessedly endowed with, and from the beauty, order, and final purpose of things." The propositions maintained in the argument are—"1. That something has existed from eternity; 2. That there has existed from eternity some one immutable and independent being; 3. That that immutable and independent being, which has existed from eternity, without any external cause of its existence, must be self-existent, that is, necessarily existing; 4. What the substance or essence of that being, which is self-existent or necessarily existing, is, we have no idea, neither is it at all possible for us to comprehend it; 5. That though the substance or essence of the self-existent being is itself absolutely incomprehensible to us, yet many of the essential attributes of his nature are strictly demonstrable, as well as his existence, and, in the first place, that he must be of necessity eternal; 6. That the self-existent being must of necessity be infinite and omnipresent, 7. Must be but one, 8. Must be an intelligent being, 9. Must be not a necessary agent, but a being indued with liberty and choice, 10. Must of necessity have infinite power, 11. Must be infinitely wise, and 12. Must of necessity be a being of infinite goodness, justice, and truth, and all other moral perfections, such as become the supreme governor and judge of the world."

In order to establish his sixth proposition, Dr Clarke contends that time and space, eternity and immensity, are not substances but attributes,—the attributes of a self-existent being. Edmund Law, Dugald Stewart, Lord Brougham, and many other writers, have, in consequence, represented Clarke as arguing from the existence of time and space to the existence of Deity. This is a serious mistake. The existence of an immutable, independent, and necessary being is supposed to be proved before

any reference is made to the nature of time and space. Clarke has been generally supposed to have derived the opinion that time and space are attributes of an infinite immaterial and spiritual being from the *Scholium Generale*, first published in the second edition of Newton's *Principia* (1714). The truth is that his work on the Being and Attributes of God appeared nine years before that *Scholium*. The view propounded by Clarke may have been derived from the Midrash, the Kabbalah, Philo, Henry More, or Cudworth, but not from Newton. It is a view difficult to prove, and probably few will acknowledge that Clarke has conclusively proved it.

His theory as to the nature, foundation, and obligation of virtue is to the following effect. Things differ from one another in their natures. They necessarily, therefore, stand in different relations to one another. From these different relations of things there must arise an agreement or disagreement of some things to others, a fitness or unfitness of the application of different things one to another. Thus there is a fitness or suitableness of certain acts in certain circumstances to certain persons and an unsuitableness of others founded on the nature of things and persons, apart from all positive appointment whatsoever. It is only imperfection or perversion of intelligence which can make the relations of things, and the fitness and unfitness involved in them, appear to be other than what they are. The fundamental truths of morals are absolutely and in themselves what they seem, no less than the truths of geometry. The obligation to virtue is involved in the very recognition of the moral relations which arise out of the necessary and eternal differences of things. It is impossible for us to apprehend them otherwise than as laws of reason which ought to guide our actions. Prior to all consideration of the divine will or law there is obligation; and God, although under no necessity to create, must, having resolved to create, have respect to certain proportions, abstractly of eternal necessity, and, having resolved to act, must determine His will according to eternal reason. His own law to himself is the law which He has given to every rational being, and which He has sanctioned by rewards and punishments. These are a secondary source of obligation.

This theory has been misunderstood and misrepresented in various ways. Jouffroy, Amédée Jacques, Sir James Mackintosh, Dr Thomas Brown, &c., criticise it on the assumption that Clarke made virtue consist in conformity to the relations of things universally, although the whole tenor of his argument shows him to have had in view only conformity to such relations as belong to the sphere of moral agency. We may admit, however, that he might have profitably insisted more on the fact that the relations and fitnesses spoken of are those which afford a reason and rule of action to the will. In this respect the doctrine of the distinguished German philosopher Herbart, which, while resolving morality into relations, lays stress on the fact that these relations are relations of will, may be regarded as an improvement of that of Clarke. It is erroneous to represent Clarke as confounding mathematical and moral relations, as overlooking that the relations involved in morality must be distinct from those involved in mere truth, or as meaning by the "fitness" which is constitutive of morality the adaptation of means and ends. In reality, he simply states an analogy between mathematical and moral truths, assigns to moral principles the distinctive peculiarity of being related to the will, and being liable to be set aside, and denotes by fitness the accordance of things with a standard by which they can be judged.

When Clarke's doctrine, that rectitude is a conformity to certain relations, has been accurately understood, it cannot fail to be obvious that, although it must be vindicated from

many of the objections which have been urged against it, no one can justly regard it as more than the mere starting-point of a theory. It must be followed up by a great amount of research before it can approximate to what a theory should be. But there is no reason why it should not be followed up by research in various directions, nor why it should not be made much more precise and definite than it has yet been. The relations involved in morality may be compared with those involved in pure science, in utility both personal and general, and in beauty, and ought to be, for it is only thus that what is distinctive of them can be brought clearly and completely out. More, perhaps, than any other theory on the nature of virtue, the theory of relations suggests and implies the necessity of a minute scientific inquiry into how truth, beauty, utility, and goodness are connected and distinguished. By Socrates and Wollaston truth and goodness, by Plato, Shaftesbury, and Herbert beauty and goodness, and by the selfish school and the utilitarian school of moralists, utility and goodness, have been, if not identified, too nearly so, while there have been held errors as great although directly contrary to these, separating unnaturally goodness from truth, or from beauty, or from utility; and it lies directly in the way of those who adopt the theory of relations to institute an investigation into the whole subject of the connection of truth, beauty, utility, and goodness, so thorough and comprehensive as to show what is true and what erroneous in all these views, and what are the resemblances and differences, the identities and distinctions, in the things themselves.

As to the biography of Clarke see the *Life* by Bishop Hoadley, and Whiston's *Historical Memoirs*. As to his philosophical, ethical, and theological tenets, there may be consulted Bishop Law's *Inquiry into the Ideas of Space, Time, &c.*, several works of Dr John Balguy (referred to in article BALGUY), Dugald Stewart's *Dissertation*, Sir James Mackintosh's *Dissertation*, Lord Brougham's *Discourse on Natural Theology*, Dr Turton's *Natural Theology*, Wardlaw's *Christian Ethics*, Dr Chalmers's *Natural Theology*, and Hunt's *Religious Thought in England, passim*, but particularly in vol. ii. 447-457, and vol. iii. 20-29 and 109-115, &c. The most elaborate essay on his philosophy as a whole is, perhaps, that by Prof. Zimmermann in the *Denkschriften d. k. Akademie der Wissenschaften, Phil.-Hist. Classe*, Bd. xix., Vienna, 1870. It treats of English rationalism before Clarke, his life, the general character of his philosophy, his criticism of materialism, his defence of natural religion, his discussion with Leibnitz, and his moral philosophy. (R. F.)

CLARKSON, THOMAS (1760-1846), was born on the 28th March 1760, at Wisbeach, in Cambridgeshire, where his father was head-master of the free grammar school. He was educated at St Paul's School and at St John's College, Cambridge. Having taken the first place among the middle bachelors as Latin essayist, he succeeded in 1785 in gaining a similar honour among the senior bachelors. The subject appointed by the vice-chancellor, Dr Peckhard, was one in which he was himself deeply interested—*Anne licet invito in servitutum dare?* (Is it right to make men slaves against their will?) In preparing for this essay Clarkson consulted a number of works on African slavery, of which the chief was Benezet's *Historical Survey of New Guinea*; and the atrocities of which he read affected him so deeply that he determined to devote all his energies to effect the abolition of the slave trade, and gave up his intention of entering the church. His first measure was to publish, with additions, an English translation of his prize-essay (June 1786). He then commenced to search in all quarters for information concerning slavery. He soon discovered that the cause had already been taken up to some extent by others, most of whom belonged to the Society of Friends, and among the chief of whom were William Dillwyn, Joseph Wood, and Granville Sharp. With the aid of these gentlemen, a committee of twelve was formed in May 1787 to do all that was possible to effect the abolition of the slave trade. Meanwhile Clarkson

had also gained the sympathy of Wilberforce, Whitbread, Sturge, and several other men of influence. Travelling from port to port, he now commenced to collect a large mass of evidence; and much of it was embodied in his *Summary View of the Slave Trade, and the Probable Consequences of its Abolition*, which, with a number of other anti-slavery tracts, was published by the committee. Pitt, Grenville, Fox, and Burke looked favourably on the movement; in May 1788 Pitt introduced a parliamentary discussion on the subject, and Sir W. Dolben brought forward a bill providing that the number of slaves carried in a vessel should be proportional to its tonnage. A number of Liverpool and Bristol merchants obtained permission from the House to be heard by council against the bill, but on the 18th June it passed the Commons. Soon after Clarkson published an *Essay on the Impolicy of the Slave Trade*; and for two months he was continuously engaged in travelling that he might meet men who were personally acquainted with the facts of the trade. From their lips he collected a considerable amount of evidence; but only nine could be prevailed upon to promise to appear before the privy council. Meanwhile other witnesses had been obtained by Wilberforce and the committee, and on the 12th May 1789 the former led a debate on the subject in the House of Commons, in which he was seconded by Burke and supported by Pitt and Fox. It was now the beginning of the French Revolution, and in the hope that he might arouse the French to sweep away slavery with other abuses, Clarkson crossed to Paris, where he remained six months. He found Necker head of the Government, and obtained from him some sympathy but little help. Mirabeau, however, with his assistance, prepared a speech against slavery, to be delivered before the National Assembly, and the Marquis de la Fayette entered enthusiastically into his views. During this visit Clarkson also met a deputation of negroes from St Domingo, who had come to France to present a petition to the National Assembly, desiring to be placed on an equal footing with the whites; but the storm of the Revolution permitted no substantial success to be achieved. Soon after his return home he engaged in a search, the apparent hopelessness of which finely displays his unshrinking laboriousness and his passionate enthusiasm. He desired to find some one who had himself witnessed the capture of the negroes in Africa; and a friend having met by chance a man-of-war's-man who had done so, Clarkson, though ignorant both of the name and of the residence of the sailor, at once set out in search of him, and after many disappointments actually discovered him. His last tour was undertaken in order to form anti-slavery committees in all the principal towns. At length, in the autumn of 1794, his health, which had long been impaired by his uninterrupted exertions, gave way, and he was obliged to cease active work. He did not, however, entirely give up the cause. At the suggestion of Wilberforce and others, he occupied his time in writing a *History of the Abolition of the Slave Trade*, which appeared in 1808. In 1818 he had an interview at Paris with the emperor of Russia, to whom he presented an address against the negro slave trade. He again visited the emperor during the conference of the European monarchs which was held at Aix-la-Chapelle, and, through him, the address was also presented to the emperor of Austria and the king of Prussia. In 1823, the slave trade having been abolished in 1807, the Anti-Slavery Society was formed, and Clarkson was one of its vice-presidents. He was for some time blind from cataract; but several years before his death his sight was restored. He died at the age of eighty-six, at his paternal house, Playford Hall, Suffolk.

Besides the works already mentioned, he published

the *Portraiture of Quakerism* (1806), *Mémoires of William Penn* (1813), *Researches, Antediluvian, Patriarchal, and Historical* (1836), intended as a history of the interference of Providence for man's spiritual good, and *Strictures on several of the remarks concerning himself made in the Life of Wilberforce*, in which his claim as originator of the anti-slavery movement is denied. See his *Mémoires* by Thomas Elmes and Thomas Taylor.

CLAUBERG, JOHN (1622–1665), one of the most noted of the immediate followers of Descartes, was born at Solingen, in Prussia, in the year 1622. After travelling in France and England, he came to Leyden, where he studied philosophy under the Cartesian John Ray. He became professor of philosophy at Herborn, and afterwards at Duisburg, and was one of the earliest teachers of the new doctrines in Germany. Clauberger is justly celebrated as an exact and methodical commentator on his master's writings; but he was no mere commentator, and his speculations anticipate in a marked degree the subsequent course of thought in the Cartesian school. His theory of the connection between the soul and the body is hardly to be distinguished from that afterwards advanced by Malebranche; while his view of the relation which God holds to his creatures is a distinct foreshadowing of the pantheism of Spinoza. All creatures exist only through the continuous creative energy of the Divine Being, and are no more independent of his will than are our thoughts independent of us,—or rather less, for there are thoughts which force themselves upon us whether we will or not. Clauberger died at Duisburg in 1665. His chief works are—*De conjunctione animæ et corporis humani scriptum*; *Exercitationes centum de cognitione Dei et nostri*; *Logica vetus et nova*; *Initiatio philosophi, seu Dubitatio Cartesiana*. He also wrote a commentary on Descartes's *Meditations*. A complete edition of his works in two vols. was published at Amsterdam in 1691.

CLAUDE, JEAN (1619–1687), a famous French Protestant preacher and controversialist, was born at Sauvetat near Agen, where his father was a Protestant minister. He held for eight years the office of professor of theology in the Protestant college of Nîmes; but in 1661, having opposed a suggestion which was made at a provincial synod for reuniting Catholics and Protestants, he was forbidden to preach in Lower Languedoc. On visiting Paris in order to appeal against this command, he became engaged in a controversy with Bossuet and Arnould concerning the Eucharist. In 1662 he obtained a post at Montauban similar to that which he had lost; but after four years he was removed from it also. He next became pastor in Paris, where he continued his controversy with Bossuet. On the revocation of the Edict of Nantes he fled to Holland, and received a pension from the Prince of Orange. He continued to preach occasionally at the Hague till his death.

His principal works are the *Réponse aux deux traités intitulés La Perpétuité de la Foi de l'Eglise Catholique touchant l'Eucharistie* (1665); *Réponse au livre de P. Nouet sur l'Eucharistie* (1668); *Défense de la Réformation, ou réponse aux préjugés légitimes de Nicole* (1678); *Plaintes des Protestants cruellement opprimés dans le Royaume de France* (1686); *Œuvres posthumes* (Amsterdam, 1688), containing the *Traité de la Composition d'un Sermon*, which was translated into English in 1778. See biographies by Nicéron and Laderize.

CLAUDE OF LORRAINE, or CLAUDE GELÉE (1600–1682), the celebrated landscape-painter, was born of very poor parents at the village of Chamagne in Lorraine. When it was discovered that he made no progress at school, he was apprenticed, it is commonly said, to a pastry-cook, but this is extremely dubious. At the age of twelve, being left an orphan, he went to live at Freiburg with an elder brother, Jean Gelée, a wood-carver of moderate merit, and under

him he designed arabesques and foliage. He afterwards rambled to Rome to seek a livelihood; but from his clownishness and ignorance of the language, he failed to obtain permanent employment. He next went to Naples, to study landscape painting under Godfrey Waals, a painter of much repute. With him he remained two years; then he returned to Rome, and was domesticated until April 1625 with another landscape-painter, Augustin Tassi, who hired him to grind his colours and to do all the household drudgery. His master, hoping to make Claude serviceable in some of his greatest works, advanced him in the rules of perspective and the elements of design. Under his tuition the mind of Claude began to expand, and he devoted himself to artistic study with great eagerness. He exerted his utmost industry to explore the true principles of painting by an incessant examination of nature; and for this purpose he made his studies in the open fields, where he very frequently remained from sunrise till sunset, watching the effect of the shifting light upon the landscape. He generally sketched whatever he thought beautiful or striking, marking every tinge of light with a similar colour; from these sketches he perfected his landscapes. Leaving Tassi, he made a tour in Italy, France, and a part of Germany, including his native Lorraine, suffering numerous misadventures by the way. Karl Dervent, painter to the duc de Lorraine, kept him as assistant for a year; and he painted at Nancy the architectural subjects on the ceiling of the Carmelite church. He did not, however, relish this employment, and in 1627 returned to Rome. Here, painting two landscapes for Cardinal Bentivoglio, he earned the protection of Pope Urban VIII. and rapidly rose into celebrity.

Claude was not only acquainted with the facts, but also with the laws, of nature; and Sandrart relates that he used to explain, as they walked together through the fields, the causes of the different appearances of the same landscape at different hours of the day, from the reflections or refractions of light, or from the morning and evening dews or vapours, with all the precision of a natural philosopher. He elaborated his pictures with great care; and if any performance fell short of his ideal, he altered, erased, and repainted it several times over.

His skies are aerial and full of lustre, and every object harmoniously illumined. His distances and colouring are delicate, and his tints have a sweetness and variety till then unexampled. He frequently gave an uncommon tenderness to his finished trees by glazing. His figures, however, are very indifferent; but he was so conscious of his deficiency in this respect, that he usually engaged other artists to paint them for him, among whom were Curtois and Filippo Lauri. Indeed, he was wont to say that he sold his landscapes and gave away his figures. In order to avoid a repetition of the same subject, and also to detect the very numerous spurious copies of his works, he made tinted outline drawings (in six paper-books prepared for this purpose) of all those pictures which were transmitted to different countries; and on the back of each drawing he wrote the name of the purchaser. These books he named *Libri di Verità*. This valuable work has been engraved and published, and has always been highly esteemed by students of the art of landscape. Claude died at Rome at the age of eighty-two, on the 21st of November 1682, leaving his wealth, which was considerable, between his only surviving relatives, a nephew and niece. Many choicest specimens of his genius may be seen in the National Gallery, and in the Louvre; the landscapes in the Altieri and Colonna Palaces in Rome are also of especial celebrity. He himself regarded a landscape which he painted in the Villa Madama, being a cento of various views with great abundance and variety of leafage, and a composition of Esther and

Ahasuerus, as his finest works; the former he refused to sell, although Clement IX. offered to cover its surface with gold pieces. He etched a series of twenty-eight landscapes, fine impressions of which are greatly prized. Full of amenity, and deeply sensitive to the graces of nature, Claude has long been deemed the prince of landscape painters, and indeed he must always be accounted a prime leader in that form of art, and in his day a great enlarger and refiner of its province. Within the last century, however, he has been vastly exceeded—in grasp, power, knowledge, subtlety, variety, and general mastery of all kinds—by many painters, one in one quality and another in another; in proof we need only name Turner, whose range, in comparison with Claude's, was as that of a continent to a canton, or a mountain to a hillock.

Claude was a man of amiable and simple character, very kind to his pupils, a patient and unwearied worker; in his own sphere of study, his mind was stored (as we have seen) with observation and knowledge, but he continued an unlettered man till his death. (V. M. R.)

CLAUDET, ANTOINE FRANÇOIS (1797–1867), an eminent photographer, was born at Lyons. Shortly after the publication of Daguerre's results (1839), Claudet, by the addition of bromide and chloride of iodine to the iodide of silver employed by the former discoverer, greatly accelerated the process of production. This, with the use of iodide of gold in fixing the image, may be said to have completed the invention. In 1848 Claudet produced the photophometer, an instrument designed to measure the intensity of photogenic rays; and in 1849 he brought out the focimeter, for securing a perfect focus in photographic portraiture. In 1850 he received a medal from the Society of Arts and Manufactures for a machine to cut glass of any curvature of surface. This was followed in 1851, 1855, and 1862 by the medals awarded by the French and English universal exhibitions for eminence in and discoveries connected with his profession, and in 1853 by his election into the Royal Society. In 1858 he produced the stereomonoscope, in reply to a challenge from Sir David Brewster. Claudet, who was photographer in ordinary to Her Majesty, was also a *decoré* of the Legion of Honour, and had received tokens of admiration and regard from Louis Philippe and the Czar Nicholas.

CLAUDIANUS, CLAUDIUS, the gifted poet who shed lustre on the last decrepid era of Roman literature, was, as we learn from himself (Epist. 1), an Egyptian by birth, and probably a native of Alexandria. It may be conjectured from his name that he was of Roman extraction, and it is hardly possible that he should have acquired such mastery over the Latin language if it had not been familiar to him from his boyhood. We have, however, his own authority for the assertion that his first poetical compositions were in Greek, and that he had written nothing in Latin before 395 A.D. In that year he appears to have come to Rome, and made his *début* as a Latin poet by a panegyric on the consulship of Olybrius and Probinus, the first brothers not belonging to the imperial family who had ever simultaneously filled the office of consul. This piece proved the precursor of the series of panegyric poems which compose the bulk of his writings. In 396 appeared the encomium on the third consulship of the Emperor Honorius, and the epic on the downfall of Rufinus, the unworthy minister of Arcadius at Constantinople. This revolution was principally effected by the contrivance of Stilicho, the great general and minister of Honorius. Claudian's poem appears to have obtained his patronage, or rather perhaps that of his wife Serena, by whose interposition the poet was within a year or two enabled to contract a wealthy marriage in Africa (Epist. 2). Previous to this event he had produced (398) his panegyric

on the fourth consulship of Honorius, his epithalamium on the marriage of Honorius to Stilicho's daughter, Maria, and his poem on the Gildonic war, celebrating the repression of a revolt in Africa. To these succeeded his piece on the consulship of Mallius Theodorus (399), the unfinished or mutilated invective against the Byzantine prime minister Eutropius, in the same year, the epics on Stilicho's first consulship and on his repulse of Alaric (400 and 403), and the panegyric on the sixth consulship of Honorius (404). From this time all trace of Claudian is lost, and he is generally supposed to have perished with his patron Stilicho in 408. It may, however, be plausibly conjectured that he must have died in 404, as he could hardly otherwise have omitted to celebrate the greatest of Stilicho's achievements, the destruction of the barbarian host led by Radagaisus in the following year. Nor, on the other hand, is ground wanting for the surmise that he may have survived Stilicho, as in the dedication to the second book of his epic on the *Rape of Proserpine*, he speaks of his disuse of poetry in terms hardly reconcilable with the fertility which, as we have seen, he displayed during his patron's lifetime. From the manner in which Augustine alludes to him in his *De Civitate Dei*, it may be inferred that he was no longer living at the date of the composition of that work, between 415 and 428.

We have already enumerated Claudian's chief poems, to which only remain to be added a number of short descriptive pieces and epigrams, his lively Fescennines on the emperor's marriage, his panegyric on Serena, and the *Gigantomachia*, a fragment of an unfinished epic. Several poems expressing Christian sentiments are undoubtedly spurious. There can be no question of his paganism, which, however, neither prevented his celebrating Christian rulers and magistrates nor his enjoying the distinction of a court laureate. We have his own authority for his having been honoured by a bronze statue in the forum, although the inscription on the pedestal which Pomponius Letus professed to have discovered in the 15th century is almost certainly spurious.

Claudian's position in literature is unique. It is sufficiently remarkable that, after nearly three centuries of torpor, the Latin muse should have experienced any revival in the age of Honorius, nothing less than amazing that this revival should have been the work of a foreigner, most surprising of all that a just and enduring celebrity should have been gained by official panegyrics on the generally uninteresting transactions of an inglorious epoch. The first of these particulars bespeaks Claudian's taste, rising superior to the prevailing barbarism, the second his command of language, the third his rhetorical skill. As remarked by Gibbon, "he was endowed with the rare and precious talent of raising the meanest, of adorning the most barren, and of diversifying the most similar topics." This gift is especially displayed in his poem on the downfall of Rufinus, where the punishment of a public malefactor is exalted to the dignity of an epical subject by the magnificence of diction and the ostentation of supernatural machinery. The noble exordium, in which the fate of Rufinus is propounded as the vindication of divine justice, places the subject at once on a dignified level; and the council of the infernal powers has afforded a hint to Tasso, and through him to Milton. The inevitable monotony of the panegyrics on Honorius is relieved by just and brilliant expatiation on the duties of a sovereign. In his celebration of Stilicho's victories Claudian found a subject more worthy of his powers, and some passages, such as the description of the flight of Alaric, and of Stilicho's arrival at Rome, and the felicitous parallel between his triumphs and those of Marius, rank among the brightest ornaments of Latin poetry. Claudian's panegyric, however lavish and re-

ardless of veracity, is in general far less offensive than usual in his age, a circumstance attributable partly to his more refined taste and partly to the genuine merit of his patron Stilicho. He is a valuable authority for the history of his times, and is rarely to be convicted of serious inaccuracy in his facts, whatever may be thought of the colouring he chooses to impart to them. As correctly observed by his latest critic, Mr Hodgkin, he was animated by true patriotic feeling, in the shape of a reverence for Rome as the source and symbol of law, order, and civilization. Outside the sphere of actual life he is less successful; his *Rape of Proserpine*, though the beauties of detail are as great as usual, betrays his deficiency in the creative power requisite for dealing with a purely ideal subject. This denotes the rhetorician rather than the poet, and in general it may be said that his especial gifts of vivid natural description and of copious illustration, derived from extensive but not cumbrous erudition, are fully as appropriate to eloquence as to poetry. In the general cast of his mind and character of his writings, and especially in his faculty for bestowing enduring interest upon occasional themes, we may fitly compare him with Dryden, remembering that while Dryden exulted in the energy of a vigorous and fast-developing language, Claudian was cramped by an artificial diction, confined to the literary class.

Claudian's works must have been carefully edited in his own time, for his epigrams include several short pieces evidently prepared for insertion in or rejected from poems of greater compass. The *editio princeps* was printed at Vicenza in 1482; the best subsequent editions are those by Gesner (1759), Burmann (1760), and Jeep (1872). There is a complete English translation of little merit, by Abraham Hawkins (London, 1817), and a version of the *Rape of Proserpine*, by Dean Howard. Some excellent criticism on Claudian will be found in Professor Ramsay's article in Smith's Classical Dictionary, and in two lectures by Mr Thomas Hodgkin (Newcastle, 1875). (R. G.)

CLAUDIUS, APPIUS CÆCUS, a Roman patrician and author of the 4th century B.C. In 312 B.C. he was elected censor without having passed through the office of consul. His censorship was remarkable for the actual or attempted achievement of several great constitutional changes. He filled vacancies in the senate with men of low birth; and when his list was rejected, and C. Plautius, his colleague, resigned, he continued, in defiance of custom, to hold the office alone. He also retained it for five years, despite the Æmilian law, which limited the duration of its tenure to a year and a half. He transferred the charge of the public worship of Hercules in the Forum Boarium from the hands of the Politian gens to that of public slaves. He distributed the *libertini* among all the tribes; and he further invaded the exclusive rights of the patricians by directing his secretary Cncius Flavius (whom, though a freedman, he made a senator) to publish the *legis actiones* and the list of *dies fasti* (or days on which legal business could be transacted). And lastly, he gained enduring fame by the construction of a road and an aqueduct, which—a thing unheard of before—he called by his own name. In the year after his resignation of the censorship (307) he was elected consul. In 298 he was made interrex; and in 296, as consul, he led the army in Samnium, and the armies of the two consuls gained a victory over the Etruscans and Samnites; but he never triumphed, nor does his military career appear to have been at all distinguished. Next year he was prætor, and he was once dictator. To the Ogulnian law admitting the plebeians to the offices of augur and pontifex he was strongly opposed; and his advocacy of the cause of the democracy seems to have ended with his censorship. His ambition and his pride of race were, however, accompanied by a passionate love of Rome.

He was already blind and tottering with age when Cineas, the minister of Pyrrhus visited him, but so vigorously did he oppose every concession that all the eloquence of Cineas was in vain, and the Romans forgot past misfortunes in the inspiration of his patriotism. The story of his blindness, however, may be merely a method of accounting for his eognomen.

Appius Claudius Cæcus is also remarkable as the first of the Roman writers, both in verse and prose, of whom we know anything. He wrote a poem which is mentioned by Cicero, but of which the remaining fragments are of the smallest, and a legal work entitled *De Usurpationibus*. It is very likely also that he was concerned in the drawing up of the *Legis Actiones* published by Flavius. His *Sententiae*, which include the famous dictum "Every one is the architect of his own fortunes," were read by Panætius, but are now lost.

CLAUDIUS, APPIUS CRASSUS, was, according to Livy, a patrician notorious for his pride and cruelty and his bitter hatred of the plebeians. Twice they refused to fight under him, and, fleeing before their enemies, brought upon him defeat and disgrace. He retaliated by decimating the army. At length they effected his banishment, but he quickly returned, and again became consul. In the same year (451 B. C.) he was made one of the decemviri who had been appointed to draw up a code of written laws, and so carefully did he act during his first year of office that he was the only one of the ten who was re-elected. With Claudius at their head, the new decemviri appear to have resolved on retaining permanent authority, but an outburst of popular feeling suddenly crushed their power. Enamoured of the beautiful daughter of the plebeian centurion Virginius, Claudius attempted to seize her by an abuse of justice. One of his clients, Marcus Claudius, swore that she was the child of a slave belonging to him, and that she had been stolen by the childless wife of the centurion. Virginius was summoned from the army, but a private message was sent at the same time instructing the general to detain him. The first messenger was more speedy than the second, and on the day of trial Virginius was present to expose the conspiracy. Still judgment was given according to the evidence of Marcus, and Claudius commanded Virginia to be given up to him. There was but one way of escape, and in despair, her father seized a knife from a neighbouring stall and plunged it in her side. The popular passion was deeply stirred. Virginius, with Icilius, the betrothed lover of his daughter, and Numitorius, her uncle, hurried to arouse the army; Horatius and Valerius put themselves at the head of the people. The decemviri were overthrown; and Appius Claudius died in prison, either by his own hand or by that of the executioner. Mommsen rejects the view given as above by Livy, and is inclined to hold that Claudius, as decemvir, was the pretended champion of the plebs, and that the revolution which ruined him was a return of the people to the rule of the patricians, who are represented by Horatius and Valerius. See appendix to vol. i. of his *History of Rome*.

CLAUDIUS, or TIBERIUS CLAUDIUS DRUSUS NERO GERMANICUS (10 B.C.—54 A.D.), the first Roman emperor of the name, born at Lugdunum (Lyons), in 10 B.C., was the son of Drusus and Antonia, and grandson of Livia, the wife of Augustus. Paralyzed and lame, and unable to speak with distinctness, he was an object of scorn even to his mother; and the natural diffidence and timidity of his character were increased by neglect and insult, till he was regarded as little better than an imbecile. His time was spent chiefly in the society of servants, and devoted to the industrious pursuit of literature; and until his accession he took no real part in public affairs, though Caligula honoured

him with the dignity of consul. His first wife was Plautia Urgulanilla, whom he divorced because he suspected her of designs against his life; his second, Ælia Petina, was also divorced; and his third was the infamous Valeria Messalina. In 41 A.D., on the murder of Caligula, Claudius was seized by the prætorians, and declared emperor. As soon as he gained resolution to assume the authority of his office, he proclaimed an amnesty for all except Chærea, the assassin of his predecessor, and one or two others. The account, however, of his painstaking government, his laborious personal administration of justice, his conquest of Britain, his extension of the *jus honorum* to the Gauls, his construction of the Claudian aqueduct and the harbour of Ostia, are matters of history (see ROMAN HISTORY). The enormities of his reign appear to have been due to the facility of character which placed him completely under the influence of his favourite freedmen, of whom the most conspicuous were Nareissus, Pallas, and Polybius, and of his wife, the vicious and shameless Messalina, whom he fondly loved and honoured. At length, according to the account of Tacitus, Messalina went through the ceremony of marriage with one of her lovers, and urged by her former confederate Narcissus, the emperor allowed her to be seized, and Narcissus put her to death. Suetonius throws a somewhat different light on the story, making it rather more probable, for he tells us that there was a rumour that the emperor desired and assisted in the marriage, because he had been warned by a soothsayer that the husband of Messalina was about to fall into misfortune. The next and fourth wife of Claudius was his niece Agrippina, a woman as criminal as any of her predecessors. She prevailed upon him to set aside his own son Britannicus in favour of Nero, her son by a former marriage; and in 54 A.D., that she might place the act beyond recall, she put the emperor to death by means of poison.

Encouraged by Livy, as Suetonius asserts, and assisted by the freedmen who attended him, Claudius produced a history of Rome, commencing with the battle of Actium (31 B.C.), in 41 books, a defence of Cicero against Asinius Pollio, memoirs of his own life, and, in Greek, a history of Carthage and a history of Etruria; but none of his writings have come down to us. He introduced three new letters into the Latin alphabet—the digamma, the ψ , and another not now known; but they appear to have been dropped at his death.

The principal authority for the life and times of Claudius is the *Annals* of Tacitus, in whose high-coloured pictures there is much that gives rise to a suspicion of exaggeration. Suetonius and Dion Cassius are even less trustworthy.

CLAUDIUS, MARCUS AURELIUS, GOTHICUS, the second of the Roman emperors of the name of Claudius, was born in Illyria or Dardania in the first half of the 3d century. On account of his military ability he was placed in command of an army by Decius; and Valerian appointed him general on the Illyrian frontier, and ruler of the provinces of the lower Danube. During the reign of Gallienus, he was called to Italy in order to crush Aureolus; and, on the death of the emperor (268 A.D.) he was chosen as his successor, in accordance, it was said, with his express desire. He enjoyed great popularity, and, as far as we can now judge, he appears to have been a man of considerable ability and strength of character. The account of his reign belongs to the history of Rome.

CLAUDIUS, MATTHIAS (1743–1815), a German poet, otherwise known by the *nom de plume* of Asmus, was born in 1743 at Rheinfeld, near Lubeck, and studied at Jena. With the exception of a short time in 1776 and 1777, when he held the office of superior commissioner or Oberlandcommissar at Darmstadt, he spent his life in the little town of Wandsbeck, near Hamburg, for which he had

conceived so strong an attachment that he would not accept any appointment which required him to settle elsewhere. Here he earned his first literary reputation by the publication, from 1770 to 1775, of a weekly periodical called the *Wandsbecker Bote* or *Wandsbeck Messenger*, in which he gave to the world a large number of prose essays and poems of various kinds. They were written in very pure and simple German, and appealed to the popular taste; in many there was a vein of extravagant humour or even burlesque, while others were full of quiet meditation and solemn sentiment. In his later days, perhaps through the influence of Klopstock, with whom he had formed an intimate acquaintance, Claudius became strongly pietistic, and the graver side of his nature was alone permitted to display itself. Instead of firing the German heart with a *Rheinweinlied*, or shaking the German sides with a *Wenn Jemand eine Reise thut*, he translated the works of Saint Martin and Fénelon. At the same time, he thought it no harm to publish a complete collection of his writings, under the whimsical title of *Asmus omnia sua secum portans, oder Sämmtliche Werke des Wandsbecker Boten*, 8 vols. 1774–1812. His biography has been written by Herbst (Gotha, 1857); and Kahle has given us *Claudius und Hebel* (Berlin, 1864).

CLAVIJO, RUY GONZALEZ DE, a Spanish traveller of the 15th century, whose narrative is the first important one of its kind contributed to Spanish literature. He was a native of Madrid, and belonged to a family of some antiquity and position. On the return of the ambassadors Solomayor and Palazuelos from the East, Henry III. determined to send another embassy to the court of Timur, who had just risen to power, and for this purpose he selected Clavijo, Gomez de Salazar, and a master of theology named Fray Alonzo Paez de Santa Maria. They sailed from Seville in May 1403, touched at the Balearic Isles, Gaeta, and Rhodes, spent some time at Constantinople, sailed along the southern coast of the Black Sea to Trebizond, and proceeded inland, probably by Etchimizin, Tabreez, Tehran, and Meshud, to Samarcand, where they were well received by the conqueror. Their return was safely accomplished, and they landed in Spain in 1406. Clavijo proceeded at once to the court, at that time in Alcalá de Henares, and served as chamberlain till the king's death in the following year; he then returned to Madrid, and lived there in opulence till his own death in April 1412. He was buried in the chapel of the monastery of San Francisco, which he had rebuilt at great expense. His itinerary was first published in 1582 at Seville, by Argote de Molina, with the title of *Historia del gran Tamorlan e itinerario y enarracion del viage y relacion de la embaxada que Ruy Gonzalez de Clavijo le hizo*,—the editor appending “a short discourse,” for the better intelligence of his author. Another edition was brought out at Madrid in 1782, by Antonio de Sancha; and from this an English translation was prepared by Clements Markham, and published by the Hakluyt Society in 1860. The identification of a great number of the places mentioned by Clavijo is a matter of considerable difficulty, and has given rise to some discussion (see Khanikof's list in *Geographical Magazine*, 1874). A short account of his life is given by Alvarez y Baena in the *Hijos de Madrid*, vol. ix.

CLAY, HENRY (1777–1852), a celebrated American politician, born near Richmond, in Virginia, on the 12th April 1777, was the son of a Baptist minister, who died when Henry was only five years old. His youth was consequently spent in some hardship, and for a time he worked on a farm; but at the age of fifteen he obtained a situation in the office of the clerk of the Court of Chancery. Having gained some influential friends, he began in 1796 to study law under Robert Brooke, the attorney-general. In 1797 he was admitted to the bar, and in the end of that year he

commenced to practise in Lexington. His great power of influencing a jury soon brought him a flourishing practice; and having taken a prominent part in the discussions as to the constitution which was drawn up for the State of Kentucky, he was in 1803 chosen member of the Legislature of that State. Three years later he became for a few months member of the Senate of the United States. In the next year he again took his seat in the Legislature of Kentucky, of which in 1808 he was appointed speaker. It was during this session that he challenged a fellow-member, who had attacked him warmly in debate. The meeting took place; two shots were fired, and both parties were slightly wounded. In 1811 he became at once member for the first time and speaker of the House of Congress, and he subsequently held the latter position four times. All his energies were now devoted to bringing about a declaration of war with Great Britain, and maintaining the contest with all the vigour possible. At the end of the war (1814) he was appointed one of the commissioners who was sent to Ghent to conclude the treaty of peace, and it was he who caused the erasure of the clause allowing Great Britain to navigate the Mississippi. During his visit to Europe he spent two months at Paris, enjoying the society of which Mme. de Staël was the queen. On his return to America he was again made speaker of Congress. In 1824 he allowed himself to be nominated for the office of president; but the election did not give to any one the required majority, and the decision between the three who had obtained the greatest number of votes had to be made by Congress. Clay, who had been fourth on the list, gave his support to Quincy Adams, whence arose his second duel, that with John Randolph, in which neither was hurt. Under Adams Clay accepted the post of secretary of state. In 1832 he was again candidate for the presidency, and again unsuccessfully; and in 1844 he was nominated for the third time with a similar result. He now retired from public life; but in 1848 he was again called into the Senate; and in 1850 he carried a bill, which sought to avert the great battle on the slavery question. In 1851, however, the weakness of his health prevented him from taking any part in public life; and on the 29th July of the next year he died. On receiving the news of his death Congress adjourned; next day orations in his praise were delivered in both houses; and the day of his funeral was observed in New York and in all the chief towns of the State to which he belonged.

Henry Clay commenced his political career in 1799 by attempting to persuade the State of Kentucky to introduce into its new constitution a provision for the gradual abolition of slavery. He never, however, made any attempt to free the whole country from the system, and the effect of much of his policy was to maintain it. His name is connected with the "Missouri Compromise," which, while providing that slavery should never be established in any State formed in the future from the lands lying to the north of lat. 36° 30', yet permitted Missouri to enter the Union as a slave-holding State. His bill of 1850, nicknamed the "omnibus bill," had for its result the admission of California into the Union on the basis of the constitution of 1849 which rejected slavery, while yet the newly acquired territories of Utah and New Mexico were left open to its introduction. A most important feature of Clay's policy was the desire to free America from European control, which led him to advocate, in some of his most powerful speeches, the recognition of the independence of the South American republics which had revolted from Spain. The part he took in the war with England has been already noticed. His action with regard to the tariff was not uniform; in 1832 he proposed to reduce gradually a large number of duties, but afterwards he

more than once sought to make it more protective. Though first opposed to the establishment of a national bank, he subsequently spoke vigorously in its favour. For some time he was president of the Colonization Society. See the edition of his speeches and writings, with a life by Calvin Colton (1857 and 1864).

CLAZOMENÆ, now KELISMAN, a town of Ionia, and a member of the Ionian Dodecapolis, or Confederation of Twelve Cities, on the Gulf of Smyrna, about 20 miles from that city in a south-west direction. It stood originally on the isthmus connecting the mainland with the peninsula on which were Erythræ and other towns of note; but the inhabitants, alarmed by the encroachments of the Persians, abandoned the continent and removed to one of the small islands of the bay, and there established their city in security. This island was connected with the mainland by Alexander the Great by means of a pier, the remains of which are still visible. Though Clazomenæ was not in existence before the arrival of the Ionians in Asia, its original founders were only partly Ionians, the great proportion being Phliasians and Cleonæans. It remained for some time subject to the Athenians, but about the middle of the Peloponnesian war it revolted. After a brief resistance, however, it again acknowledged the Athenian supremacy, and repelled the Lacedæmonians when they attempted to gain possession of the town. Under the Romans Clazomenæ was included in the province of Asia, and enjoyed an immunity from taxation. The site of the city can still be made out, in the neighborhood of Vourla, but nearly every portion of its ruins has been removed. Anaxagoras the philosopher was born in Clazomenæ, 499 B.C.

CLEANTHES, a Stoic philosopher, born at Assos in Asia Minor, about 300 B.C., was originally a boxer. He first listened to the lectures of Crates the Cynic, and then to those of Zeno, the Stoic, supporting himself meanwhile by working all night as water-carrier to a gardener. His apparent idleness aroused suspicion, and he was summoned before the Areopagus; but when his story became known the court offered him a present of ten minæ, which he refused to accept. His power of patient endurance, or perhaps his slowness, earned him the title of the Ass; but such was the esteem awakened by his high moral qualities that, on the death of Zeno in 263, he became the leader of the school. He still, however, continued to support himself as before by the labour of his own hands. Among his pupils were his successor, Chrysippus, and Antigonus, king of Macedon, from whom he accepted 2000 minæ. The story of his death, which took place about 220 or 225 B.C., is thus related. Being troubled by an ulcer, he had been directed to fast for a short time, but when that time had expired, he still refused to eat on the ground that he was now half-way on the road to death, and need not take the trouble of twice performing the journey.

Cleantes produced very little that was original, though he wrote some fifty works, of which fragments have come down to us. The principal is the large portion of the *Hymn to Jupiter* which has been preserved in Stobæus. He regarded the sun as the abode of God, the intelligent providence, or (in accordance with Stoical materialism) the vivifying fire or æther of the universe. Virtue, he taught, is life according to nature; but pleasure is not according to nature. He also originated a new theory as to the individual existence of the human soul; for he held that the degree of its vitality after death depends upon the degree of its vitality in this life. The principal fragments of Cleantes's works are contained in Diogenes Laertius and Stobæus; some may be found in Cicero and Seneca. See Zeller, *Stoics, Epicureans, and Sceptics*; and Ritter, *Geschichte der Philosophie*.

CLEARCHUS, a Spartan general of the 5th century B.C. After serving in the Hellespont and at the battle of Cyzicus, he became harmost of Byzantium; but, during his absence, the town was surrendered, and he was consequently

punished by a fine. He continued, however, to be employed in matters of importance; but at length, after being sent into Thraee to protect the Greek colonies, he was recalled by the Ephors. He refused to obey, and made himself master of Byzantium. Being driven thence, he visited the court of Cyrus, for whom he levied a little army of Greek mercenaries, which he led on the famous Expedition of the Ten Thousand. He was the only one of the Greeks who was acquainted with the real intention of Cyrus; and it was not till they had proceeded too far to retire with safety that he made known the object for which they had been collected. He commanded a division of his countrymen in the battle of Cunaxa (401 B.C.); and he led them on their difficult return journey till, being treacherously seized by Tissaphernes, he was sent to the court of Artaxerxes, where he was put to death.

CLEMENS ALEXANDRINUS. The little we know of Clemens Alexandrinus is mainly derived from his own works. The earliest writer after himself who gives us any information with regard to him is Eusebius. The only points on which his works now extant inform us are his date and his instructors. In the *Stromata*, while attempting to show that the Jewish Scriptures were older than any writings of the Greeks, he invariably brings down his dates to the death of Commodus, a circumstance which at once suggests that he wrote in the reign of the Emperor Severus, from 193 to 211 A.D. (see *Strom.*, lib. i. cap. xxi. 140, p. 403, Potter's edition). The passage in regard to his teachers is corrupt, and the sense is therefore doubtful (*Strom.*, lib. i. cap. i. 11, p. 322, P.)

"This treatise," he says, speaking of the *Stromata*, "has not been contrived for mere display, but memoranda are treasured up in it for my old age to be a remedy for forgetfulness,—an image, truly, and an outline of those clear and living discourses, and those men truly blessed and noteworthy I was privileged to hear. One of these was in Greece, the Ionian, the other was in Magna Græcia; the one of them was from Cæle Syria, the other from Egypt; but there were others in the East, one of whom belonged to the Assyrians, but the other was in Palestine, originally a Jew. The last of those whom I met was first in power. On falling in with him I found rest, having tracked him while he lay concealed in Egypt. He was in truth the Sicilian bee, and, plucking the flowers of the prophetic and apostolic meadow, he produced a wonderfully pure knowledge in the souls of the listeners."

Some have supposed that in this passage seven teachers are named, others that there are only five, and various conjectures have been hazarded as to what persons were meant. The only one about whom conjecture has any basis for speculating is the last, for Eusebius states (*Hist. Eccl.*, v. 11) that Clement made mention of Pantænus as his teacher in the *Hypotyposes*. The reference in this passage is plainly to one whom he might well designate as his teacher.

To the information which Clement here supplies subsequent writers add little. By Eusebius and Photius he is called Titus Flavius Clemens, and "the Alexandrian" is added to his name. Epiphanius tells us that some said Clement was an Alexandrian, others that he was an Athenian (*Hær.*, xxxii. 6), and a modern writer imagined that he reconciled this discordance by the supposition that he was born at Athens, but brought up at Alexandria. We know nothing of his conversion except that he passed from heathenism to Christianity. This is expressly stated by Eusebius (*Præp. Evangel.*, lib. ii. cap. 2), though it is likely that Eusebius had no other authority than the works of Clement. These works, however, warrant the inference. They show a singularly minute acquaintance with the ceremonies of pagan religion, and there are indications that Clement himself had been initiated in some of the mysteries (*Protrept.*, cap. ii. sec. 14, p. 13, P.). There is no means of determining the date of his conversion. He attained the position of presbyter in the church of Alexandria (Eus., *Hist. Eccl.*, vi. 11, and Jerome, *De Vir.*

Ill., 38), and became the successor of Pantænus in the catechetical school of that place. Among his pupils were Origen (Eus., *Hist. Eccl.*, vi. 7) and Alexander, bishop of Jerusalem (Eus., *Hist. Eccl.*, vi. 14). How long he continued in Alexandria, and when and where he died, are all matters of pure conjecture. The only further notice of Clement that we have in history is in a letter written in 211 by Alexander, bishop of Jerusalem, to the Antiochians, and preserved by Eusebius (*Hist. Eccl.*, vi. 11). The words are as follows:—"This letter I sent through Clement the blessed presbyter, a man virtuous and tried, whom ye know and will come to know completely, who being here by the providence and guidance of the Ruler of all strengthened and increased the church of the Lord." A statement of Eusebius in regard to the persecution of Severus in 202 (*Hist. Eccl.*, vi. 3) would render it likely that Clement left Alexandria on that occasion. It is conjectured that he went to his old pupil Alexander, who was at that time bishop of Flaviada in Capadocia, and that when his pupil was raised to the see of Jerusalem Clement followed him there. The letter implies that he was known to the Antiochians, and that it was likely he would be still better known. Some have conjectured that he returned to Alexandria, but there is not the shadow of evidence for such conjecture.

Eusebius and Jerome give us lists of the works which Clement left behind him. Photius has also described some of them. They are as follows:—1. πρὸς Ἕλληνας λόγος ὁ προτροπικός, *A Hortatory Address to the Greeks*. 2. ὁ παιδαγωγός, *The Tutor*, in three books. 3. Στρωματεῖς, or *Patch-work*, in eight books. 4. τίς ὁ σωζόμενος πλούσιος, *Who is the Rich Man that is Saved?* 5. Eight books of ἑρμηνείαι, *Adumbrations or Outlines*. 6. *On the Pass-over*. 7. *Discourses on Fasting*. 8. *On Slander*. 9. *Exhortation to Patience, or to the Newly Baptized*. 10. The κατὰ ἐκκλησιαστικὴν, *the Rule of the Church, or to those who Judaize*, a work dedicated to Alexander, bishop of Jerusalem.

Of these, the first four have come down to us complete, or nearly complete. The first three form a series. The *Hortatory Address* to the Greeks is an appeal to them to give up the worship of their gods, and to devote themselves to the worship of the one living and true God. Clement exhibits the absurdity and immorality of the stories told with regard to the pagan deities, the cruelties perpetrated in their worship, and the utter uselessness of bowing down before images made by hands. He at the same time shows the Greeks that their own greatest philosophers and poets recognized the unity of the divine Being, and had caught glimpses of the true nature of God, but that fuller light had been thrown on this subject by the Hebrew prophets. He replies to the objection that it was not right to abandon the customs of their forefathers, and points them to Christ as their only safe guide to God.

The *Pædagogus* is divided into three books. In the first Clement discusses the necessity for and the true nature of the *Pædagogus*, and shows how Christ as the Logos acted as *Pædagogus*, and still acts. In the second and third books Clement enters into particulars, and explains how the Christian following the Logos or Reason ought to behave in the various circumstances of life—in eating, drinking, furnishing a house, in dress, in the relations of social life, in the care of the body, and similar concerns, and concludes with a general description of the life of a Christian. Appended to the *Pædagogus* are two hymns, which are, in all probability, the production of Clement, though some have conjectured that they were portions of the church service of that time.

Stromata, or rather Στρωματεῖς, are coverlets made out of miscellaneous pieces of cloth. The title is used by Clement to designate a miscellaneous collection of materials, and Clement's work is unquestionably of this nature. It is impossible to give a brief account of its varied contents. Sometimes he discusses chronology, sometimes philosophy, sometimes poetry, entering into the most minute critical and chronological details; but one object runs through all, and this is to show what the true Christian Gnostic is, and what is his relation to philosophy. The work was in eight books. The first seven are complete. The eighth now extant is really an incomplete treatise on logic. Some critics have rejected this book as spurious, since its matter is so different from that of the rest. Others, however, have held to its genuineness, because in a Patch-work or Book of Miscellanies the difference of subject is no sound objection, and because Photius seems to have regarded our present eighth book as genuine (Phot., cod. 111, p. 59b, Bekker).

The treatise *Who is the Rich Man that is Saved?* is an admirable exposition of the narrative contained in St Mark's Gospel, x. 17-31. It was in all probability preached.

The *Hypotyposes* have not come down to us. Cassiodorus translated them into Latin, freely altering to suit his own ideas of orthodoxy. Both Eusebius and Photius describe the work. It was a short commentary on all the books of Scripture, including some of the apocryphal works, such as the Epistle of Barnabas and the Revelation of Peter. Photius speaks in strong language of the impiety of some opinions in the book (*Bibl.*, ed. 109, p. 89a, Bekker), but his statements are such as to prove conclusively that he must have had a corrupt copy, or read very carelessly, or grossly misunderstood Clement. Notes in Latin on the first epistle of Peter, the epistle of Jude, and the first two of John have come down to us; but whether they are the translation of Cassiodorus, or indeed a translation of Clement's work at all, is a matter of dispute.

The treatise on the Passover was occasioned by a work of Melito on the same subject. Two fragments of this treatise were given by Petavius, and are contained in the modern editions.

We know nothing of the work called *The Ecclesiastical Canon* from any external testimony. Clement himself often mentions the *ἐκκλησιαστικὸς κανὼν*, and defines it as the agreement and harmony of the law and the prophets with the covenant delivered at the appearance of Christ (*Strom.*, vi. cap. xv. 125, p. 803, P.). No doubt this was the subject of the treatise. Jerome and Photius call the work *Ecclesiastical Canons*, but this seems to be a mistake.

Of the other treatises mentioned by Eusebius and Jerome nothing is known. A fragment of Clement, quoted by Antoninus Melissa, is most probably taken from the treatise on slander.

Besides the treatises mentioned by Eusebius, fragments of treatises on Providence and the Soul have been preserved. Mention is also made of a work by Clement on the Prophet Amos, and another on Definitions.

In addition to these Clement often speaks of his intention to write on certain subjects, but it may well be doubted whether in most cases, if not all, he intended to devote separate treatises to them. Some have found an allusion to the treatise on the Soul already mentioned. The other subjects are Marriage (*γαμικὸς λόγος*), Continence, the Duties of Bishops, Presbyters, Deacons, and Widows, Prophecy, the Soul, the Transmigration of the Soul and the Devil, Angels, the Origin of the World, First Principles and the Divinity of the Logos, Allegorical Interpretation of Statements made with regard to God's anger and similar affections, the Unity of the Church, and the Resurrection.

Two works are incorporated in the editions of Clement which are not mentioned by himself or any ancient writer. They are *ἐκ τῶν Θεοδότου καὶ τῆς ἀνατολικῆς καλουμένης διδασκαλίας κατὰ τοὺς Οὐαλεντίνου χρόνους ἐπιτομαί*, and *ἐκ τῶν προφητικῶν ἐκλογαί*. The first, if it is the work of Clement, must be a book merely of excerpts, for it contains many opinions which Clement opposed. Mention is made of Pantenus in the second, and some have thought it more worthy of him than the first. Others have regarded it as a work similar to the first, and derived from Theodorus.

Clement occupies a profoundly interesting position in the history of Christianity. He is the first to bring all the culture of the Greeks and all the speculations of the Christian heretics to bear on the exposition of Christian truth. He does not attain to a systematic exhibition of Christian doctrine, but he paves the way for it, and lays the first stones of the foundation. In some respects Justin anticipated him. He also was well acquainted with Greek philosophy, and took a genial view of it; but he was not nearly so widely read as Clement. The list of Greek authors whom Clement has quoted occupies upwards of fourteen of the quarto pages in Fabricius's *Bibliotheca Græca*. He is at home alike in the epic and the lyric, the tragic and the comic poets, and his knowledge of the prose writers is very extensive. He made a special study of the philosophers. Equally minute is his knowledge of the systems of the Christian heretics. And in all cases it is plain that he not merely read but thought deeply on the questions which the civilization of the Greeks and the various writings of poets, philosophers, and heretics raised. He pondered on all he read that he might gain a clearer insight into the truth. But it was in the Scriptures that he found his greatest delight. He believed them to contain the revelation of God's wisdom to men. He quotes all the books of the Old Testament except Ruth and the Song of Solomon, and amongst the sacred writings of the Old Testament he evidently included the Book of Tobias, the Wisdom of Solomon, and Ecclesiasticus. He is equally full in his quotations from the New Testament, for he

quotes from all the books except the epistle to Philemon, the second epistle of St Peter, and the epistle of St James, and he quotes from the pastor of Hermas, and the epistles of Clemens Romanus and of Barnabas, as inspired. He appeals also to many of the lost Gospels, such as those of the Hebrews, of the Egyptians, and of Matthias.

Notwithstanding this adequate knowledge of Scripture, the modern theologian is disappointed to find very little of what he deems characteristically Christian. In fact Clement regarded Christianity as a philosophy. The ancient philosophers sought through their philosophy to attain to a nobler and holier life, and this also was the aim of Christianity. The difference between the two, in Clement's judgment, was that the Greek philosophers had only glimpses of the truth, that they attained only to fragments of the truth, while Christianity revealed in Christ the absolute and perfect truth. All the stages of the world's history were therefore preparations leading up to this full revelation, and God's care was not confined to the Hebrews alone. The worship of the heavenly bodies, for instance, was given to man at an early stage that he might rise from a contemplation of these sublime objects to the worship of the Creator. Greek philosophy in particular was the preparation of the Greeks for Christ. It was the schoolmaster or pædagogus to lead them to Christ. Plato was Moses atticizing. Clement varies in his statement how Plato got his wisdom or his fragments of the Reason. Sometimes he thinks that they came direct from God, like all good things, but he is also fond of maintaining that many of Plato's best thoughts were borrowed from the Hebrew prophets; and he makes the same statement in regard to the wisdom of the other philosophers. But however this may be, Christ was the end to which all that was true in philosophies pointed. Christ himself was the Logos, the Reason. God the Father was ineffable. The Son alone can manifest Him fully. He is the Reason that pervades the universe, that brings out all goodness, that guides all good men. It was through possessing somewhat of this Reason that the philosophers attained to any truth and goodness; but in Christians He dwells more fully and guides them through all the perplexities of life. It is easy to see that this doctrine in regard to Christ may be misconstrued. If Jesus were the Reason, thus visible in all goodness, how could there be a real difference between Him and the Father, or how could He really become incarnate? Photius, probably on a careless reading of Clement, argued that he could not have believed in a real incarnation. But the words of Clement are quite precise and their meaning indisputable. He believed in a personal God different from the universe. He believed in a personal Son of God who was the Reason and Wisdom of God; and he believed that this Son of God really became incarnate. The object of His incarnation and death was to free man from his sins, to lead him into the path of wisdom, and thus in the end elevate him to the position of a god. But man's salvation was to be gradual. It began with faith, passed from that to love, and ended in full and complete knowledge. There could be no faith without knowledge. But the knowledge is imperfect, and the Christian was to do many things in simple obedience without knowing the reason. But he has to move upwards continually until he at length does nothing that is evil, and he knows fully the reason and object of what he does. He thus becomes the true Gnostic, but he can become the true Gnostic only by contemplation and by the practice of what is right. He has to free himself from the power of passion. He has to give up all thoughts of pleasure. He must prefer goodness in the midst of torture to evil with unlimited pleasure. He has to resist the temptations of the body, keeping it under strict control, and with the eye of the soul undimmed by

corporeal wants and impulses, contemplate God the supreme good, and live a life according to reason. In other words, he must strive after likeness to God as He reveals himself in his Reason or in Christ. Clement thus looks entirely at the enlightened moral elevation to which Christianity raises man. He believed that Christ instructed men before He came into the world, and he therefore viewed heathenism with kindly eye. He was also favourable to the pursuit of all kinds of knowledge. All enlightenment tended to lead up to the truths of Christianity, and hence knowledge of every kind not evil was its handmaid. Clement had at the same time a strong belief in evolution or development. The world went through various stages in preparation for Christianity. The man goes through various stages before he can reach Christian perfection. And Clement conceived that this development took place not merely in this life, but in the future through successive grades. The Jew and the heathen had the gospel preached to them in the world below by Christ and His apostles, and Christians will have to pass through processes of purification and trial after death before they reach perfect knowledge and perfect bliss.

The beliefs of Clement have caused considerable difference of opinion among modern scholars. He sought the truth from whatever quarter he could get it, believing that all that is good comes from God, wherever it be found. He belongs, therefore, to no school of philosophers. Some have insisted that he was an eclectic. Daehne has tried to show that he was Neo-Platonic, and Reinkens has maintained that he was essentially Aristotelian. His mode of viewing Christianity does not fit into any classification. It is the result of the period in which he lived, of his wide culture and the simplicity and noble purity of his character.

It is needless to say that his books well deserve study; but the study is not smoothed by beauty of style. Clement despised ornament. He wished to avoid everything that might seem to deceive. He thought also that it was quite possible to throw pearls before swine, and that care should be taken to prevent this by digressions and difficulties which only the earnest student would encounter. He is singularly simple in his character. In discussing marriage he refuses to use any but the plainest language. A euphemism is with him a falsehood. But he is temperate in his opinions; and the practical advice in the second and third books of the *Protrepticus* are remarkably sound and moderate. He is not always very critical, and he is passionately fond of allegorical interpretation; but these were the faults of his age.

All early writers speak of Clement in the highest terms of laudation, and he certainly ought to have been a saint in any Church that reveres saints. But Clement is not a saint in the Roman Church. He was a saint up till the time of Benedict XIV., who read Photius on Clement, believed him, and struck the Alexandrian's name out of the calendar. The Pope was unquestionably wrong; and many Roman Catholic writers, though they yield a practical obedience, have adduced good reason why the decision of the Pope should be reversed (Cognat, p. 451).

The editions of Clement's works are by (1) Petrus Victorinus, 1550; (2) Sylburg, 1592; (3) Heinsius, 1616; (4) Fronto Ducaens, 1629, 1641, 1688; (5) Potter, London, 1715 (this was by far the best edition, and has formed the basis of subsequent editions; it was reprinted at Venice, 1757, and in Galland's *Bibliotheca*, in Oberthür, and in Migne's *Cursus Patrologia Græca*); (6) Klotz, Leipzig, 1831; (7) W. Dindorf, Oxford, 1869. There are separate editions of *Quis dices salvetur* by Ghislar, Combefisius, Fell, Ittig, Segaar, and Lindner.

The writings that discuss Clement are very numerous. Notice is taken of him by ecclesiastical historians, and by the historians of Christian literature, among whom Lumper, Permaneder, and Kontogones deserve special mention. There are monographs on Clement and his doctrine by J. and F. Tribbechovius, Bieleke, Guericke,

Hofstede de Groot, Daehne, Lentzen, Reinkens, Reuter, Laemmer, Duperron, Cognat, Lipsius, Müller, and Freppel, by Miss Cornwallis in her *Small Books on Great Subjects*, No. vii., and by Bishop Kaye. Clement's works have been translated in Clark's Ante-Nicene Christian Library, by the Rev. W. Wilson. (J. D.)

CLEMENT, the name borne by fourteen Popes.

CLEMENT I. (Clemens Romanus). See APOSTOLIO FATHERS, vol. ii. p. 195.

CLEMENT II. (Suidger, a Saxon, bishop of Bamberg) was chancellor to the Emperor Henry III., to whom he was indebted for his elevation to the Papacy upon the abdication of Gregory VI. (December 1046). His short pontificate was only signalized by the convocation of a council in which decrees were enacted against simony. He died in October 1047, and was interred at Bamberg.

CLEMENT III. (Paulino Scolari, bishop of Præneste) was elected Pope in December 1187, and died in March 1191. He succeeded shortly after his accession in allaying the discords which had prevailed for half a century between the Popes and the citizens of Rome, in virtue of an agreement by which the latter were allowed to elect their magistrates, while the nomination of the governor of the city remained in the hands of the Pope. He incited Henry II. of England and Philip Augustus to undertake the third crusade, and introduced several minor reforms in ecclesiastical matters.

CLEMENT IV. (Gui Foulques, archbishop of Narbonne) was elected Pope in February 1265. Before taking orders he had been successively a soldier and a lawyer, and in the latter capacity had acted as secretary to Louis IX. of France, to whose influence he was chiefly indebted for his elevation. At this time the Holy See was engaged in a conflict with Manfred, the usurper of Naples; and Clement, whose election had taken place in his absence, was compelled to repair to Italy in disguise. He immediately took steps to ally himself with Charles of Anjou, the French pretender to the Neapolitan throne, who marched into Naples, and having defeated and slain Manfred in the great battle of Benevento, established himself firmly in the kingdom. Clement is said to have disapproved of the cruelties committed by Charles, and there seems no foundation for the charge of his having advised the latter to execute the unfortunate Conradin, the last of the church's hereditary antagonists of the house of Hohenstaufen. His private character was unexceptionable, and he is especially commended for his indisposition to promote and enrich his own relatives. He also did himself great honour by his encouragement and protection of Roger Bacon. He died in November 1268, and was buried at Viterbo, where he had resided throughout his pontificate.

CLEMENT V. (Bertrand de Goth, archbishop of Bordeaux) is memorable in history for his suppression of the order of the Templars, and as the Pope who removed the seat of the Roman see to Avignon. He was elected in June 1305, after a year's interregnum occasioned by the disputes between the French and Italian cardinals, who were nearly equally balanced in the conclave. According to Villani he had bound himself to subservience towards the French monarch by a formal agreement previous to his elevation; however this may be, it is unquestionable that he conducted himself throughout his pontificate as the mere tool of that monarch. His first act was to create nine French cardinals. The removal of the seat of the Papacy to Avignon (1308) might seem palliated by the factious and tumultuary condition of Rome at the period, but it proved the precursor of a long "Babylonish captivity," in Petrarch's phrase, and marks the point from which the decay of the strictly Catholic conception of the Pope as universal bishop is to be dated. The guilt or innocence of the Templars is one of the most difficult of historical problems, the discussion of which belongs, however, to the history of the order.

Clement may have acted conscientiously in his suppression of an order which had heretofore been regarded as a main bulwark of Christianity, but there can be little doubt that his principal motive was complaisance towards the king of France, or that the latter was mainly actuated by jealousy and cupidity. Clement's pontificate was also disastrous for Italy. The Emperor Henry VII. entered the country, established the Visconti in Milan, and was crowned by Clement's legates in Rome, but was unable to maintain himself there, and died suddenly, leaving great part of Italy in a condition of complete anarchy. The dissensions of the Roman barons reached their height, and the Lateran palace was destroyed in a conflagration. Other remarkable incidents of Clement's reign are his sanguinary repression of the heresy of Fra Dolcino in Lombardy and his promulgation of the Clementine Constitutions in 1313. He died, leaving an inauspicious character for nepotism, avarice, and cunning, in April 1314. He was the first Pope who assumed the triple crown.

CLEMENT VI. (Pierre Roger, archbishop of Rouen), the fourth of the Avignon popes, was elected in May 1342. Like his immediate predecessors, he was devoted to France, and he further evinced his French sympathies by refusing a solemn invitation to return to Rome, and by purchasing the sovereignty of Avignon from Joanna, queen of Naples, for 80,000 crowns. The money was never paid, but Clement may have deemed that he gave the queen a full equivalent by absolving her from the murder of her husband. The other chief incidents of his pontificate were his disputes with Edward III. of England on account of the latter's encroachments on ecclesiastical jurisdiction, his excommunication of the Emperor Louis of Bavaria, his negotiations for reunion with the Eastern Church, and the commencement of Rienzi's agitation at Rome. He died in December 1352, leaving the reputation of "a fine gentleman, a prince munificent to profusion, a patron of the arts and learning, but no saint" (Gregorovius; see also Gibbon, chap. 66).

CLEMENT VII. (Giulio de' Medici), the most unfortunate of the Popes, was the son of Giuliano de' Medici, assassinated in the conspiracy of the Pazzi, and consequently nephew of Lorenzo the Magnificent and cousin of Pope Leo X. Upon the latter's accession to the Papacy, Giulio became his principal minister and confidant, especially in the maintenance of the Medici interest at Florence. At Leo's death, Cardinal Medici, though unable to gain the Papacy for himself or his ally Farnese, took a leading part in determining the unexpected election of Adrian VI., to whom he succeeded in the next conclave (November 1523). He brought to the Papal throne a high reputation for political ability, and possessed in fact all the accomplishments of a wily diplomatist, but the circumstances of the times required a man of far different mould. His worldliness and lack of insight into the tendencies of his age disqualified him from comprehending the great religious movement which then convulsed the church; while his timidity and indecision no less disabled him from following a consistent policy in secular affairs. At first attached to the imperial interest, he was terrified by the overwhelming success of the emperor in the battle of Pavia into joining the other Italian princes in a league with France. This policy in itself was sound and patriotic, but Clement's zeal soon cooled; by his want of foresight and unseasonable economy he laid himself open to an attack from the turbulent Roman barons which obliged him to invoke the mediation of the emperor. When this danger seemed over he veered back to his former engagements, and ended by drawing down upon himself the host of the imperialist general, the Constable Bourbon, who, compelled to satisfy his clamorous mercenaries by pillage, embraced the

opportunity of leading them against Rome. The city was assaulted and sacked on May 5, 1527, and Clement, who had displayed no more resolution in his military than in his political conduct, was shortly afterwards obliged to surrender himself together with the castle of St Angelo, where he had taken refuge. After six months' captivity he was released upon very onerous conditions, and for some years subsequently followed a policy of subserviency to the emperor, endeavouring on the one hand to induce him to act with severity against the Lutherans in Germany, and on the other to elude his demands for a general council. One momentous consequence of this dependence on Charles V. was the breach with England occasioned by Clement's refusal, justifiable in point of principle, but dictated by no higher motive than his fear of offending the emperor, to sanction Henry VIII.'s divorce from Catherine of Aragon. Towards the end of his reign Clement once more gave indications of a leaning towards a French alliance, which was prevented by his death in September 1534. As a man he possessed few virtues and few vices; as a pontiff he did nothing to disgrace the church and nothing to restore its lustre; his adroitness and dexterity as a statesman were counteracted by his suspicion and irresolution; his administration affords a proof that at eventful crises of the world's history mediocrity of character is more disastrous than mediocrity of talent.

CLEMENT VIII. (Ippolito Aldobrandini) was elected in January 1592. The most remarkable event of his reign was the reconciliation to the church of Henry IV. of France after long negotiations carried on with great dexterity by Cardinal D'Ossat. Europe is principally indebted to this Pope for the peace of Vervins (1598), which put an end to the long contest between France and Spain. Clement also annexed Ferrara to the States of the Church upon the failure of the line of Este, the last addition of importance to the Pope's temporal dominions. The execution of Giordano Bruno, February 17, 1600, is a blot upon an otherwise exemplary pontificate. Clement was an able ruler and a sagacious statesman, the general object of whose policy was to free the Papacy from its undue dependence upon Spain. The conferences to determine the questions of grace and free will, controverted between the Jesuits and Dominicans, were commenced under him, but he wisely abstained from pronouncing a decision. He died in March 1605, leaving a high character for prudence, munificence, and capacity for business. His reign is especially distinguished by the number and beauty of his medals.

CLEMENT IX. (Giulio Rospigliosi) was elected Pope in June 1667. Nothing remarkable occurred under his short administration beyond the temporary adjustment of the disputes between the Roman see and those prelates of the Gallican church who had refused to join in condemning the writings of Jansenius. He died in December 1669.

CLEMENT X. (Emilio Altieri) was elected in April 1670, at the age of eighty. His years and infirmities led him to devolve the charge of the government upon his nephew, Cardinal Altieri, whose interference with the privileges of ambassadors occasioned disputes in which the Pope was obliged to yield. Little else of importance occurred during his reign, which terminated in July 1676.

CLEMENT XI. (Giovanni Francesco Albani) was elevated to the pontificate in November 1700, and died in March 1721. The most memorable transaction of his administration was the publication in 1713 of the bull *Unigenitus*, which so greatly disturbed the peace of the Gallican church. By this famous document 101 propositions extracted from the works of Quesnel were condemned as heretical, and as identical with propositions already condemned in the writings of Jansenius. The resistance of many French ecclesiastics and the refusal of the French parliaments to

register the bull led to controversies extending through the greater part of the 18th century. Another important decision of this Pope's was that by which the Jesuit missionaries were forbidden to take a part in idolatrous worship, and to accommodate Christian language to pagan ideas under plea of conciliating the heathen. The political troubles of the time greatly embarrassed Clement's relations with the leading Catholic powers, and the moral prestige of the Holy See suffered much from his compulsory recognition of the Archduke Charles of Austria as king of Spain. His private character was irreproachable; he was also an accomplished scholar, and a patron of letters and science.

CLEMENT XII. (Lorenzo Corsini) was Pope from July 1730 to February 1740. His first act was the trial and condemnation of Cardinal Coscia, guilty of malversation under his predecessor. Nothing else of importance occurred under his administration, during the greater part of which, according to some historians, he was afflicted with blindness. He was the first pontiff who condemned the Freemasons.

CLEMENT XIII. (Carlo Rezzonico, bishop of Padua) was elected in July 1758. Notwithstanding the meekness and affability of his character, his pontificate was disturbed by perpetual contentions respecting the investiture of Parma, and subsequently by the demands of France, Spain, and Portugal for the suppression of the Jesuits. Clement warmly espoused the cause of the order in an apostolical brief issued in 1765. The pressure put upon him by the Catholic powers, however, was so strong that he seemed about to give way, when, having convoked a consistory to receive his decision, he died suddenly, February 3, 1769, not without suspicion of poison.

CLEMENT XIV. (Giovanni Vincenzo Antonio Ganganelli), the best and most calumniated of the popes, was born in 1705, and was originally a Franciscan monk. Having acquired a great reputation as a preacher, he became the friend and confidant of Pope Benedict XIV., and was created a cardinal by his successor. He was elected Pope on May 19, 1769, after a conclave extremely agitated by the intrigues and pretensions of the Catholic sovereigns, who were resolved to exclude every candidate favourable to the Jesuits. Theiner has satisfactorily vindicated Ganganelli from the charge of having given a formal pledge on this subject. He may probably have lent to the views of the Catholic powers, but if so his motive was widely different from the subservience which had induced his predecessor Clement V. to gratify Philip the Fair by the suppression of the Templars. The breach between the temporal and the spiritual authorities had become threatening, and the guiding principle of Clement's policy was undoubtedly the reconciliation of the European sovereigns, whose alienation threatened to produce the results which we have seen accomplished in our own times. By yielding the Papal pretensions to Parma, he obtained the restitution of Avignon and Benevento, and in general he succeeded in placing the relations of the spiritual and the temporal authorities on a satisfactory footing. Whether from scruple or policy he proceeded with great circumspection in the suppression of the Jesuits, the decree to this effect not being framed until November 1772, and not signed until July in the following year. This memorable measure, which takes rank in history as the most remarkable, perhaps the only really substantial, concession ever made by a Pope to the spirit of his age, has covered Clement's memory with obloquy in his own communion. There cannot be any reasonable doubt of the integrity of his conduct, and the only question is whether he acted from a conviction of the pernicious character of the Society of Jesus, or merely from a sense of expediency. In either case his action was abundantly justified, and to allege that though beneficial to the world it was detrimental to the church is merely to

insist that the interests of the Papacy are not the interests of mankind. His work was hardly accomplished ere Clement, whose natural constitution was exceedingly vigorous, fell into a languishing sickness, generally and plausibly attributed to poison. No conclusive evidence of this, however, has been produced; and it is but just to remark that poison would more probably have been administered before the obnoxious measure had been taken than when it was already beyond recall. Clement expired on September 22, 1774, execrated by the Ultramontane party, but regretted by his subjects for his excellent temporal administration. No Pope has better merited the title of a virtuous man, or has given a more perfect example of integrity, unselfishness, and aversion to nepotism. Notwithstanding his monastic education, he approved himself a statesman, a scholar, an amateur of physical science, and an accomplished man of the world. As Leo X. indicates the manner in which the Papacy might have been reconciled with the Renaissance had the Reformation never taken place, so Ganganelli exemplifies the type of Pope which the modern world might have learned to accept if the movement towards free thought could, as Voltaire wished, have been confined to the aristocracy of intellect. In both cases the requisite condition was unattainable; neither in the 16th nor in the 18th century has it been practicable to set bounds to the spirit of inquiry otherwise than by fire and sword, and Ganganelli's successors have been driven into assuming a position analogous to that of Paul IV. and Pius V. in the age of the Reformation. The estrangement between the secular and the spiritual authority which Ganganelli strove to avert is now irreparable, and his pontificate remains an exceptional episode in the general history of the Papacy, and a proof how little the logical sequence of events can be modified by the virtues and abilities of an individual. The history of Clement's administration has been written in a spirit of the most violent detraction by Cretineau-Joly, and perhaps too unreservedly in the opposite spirit by Father Theiner, the custodian of the archives of the Vatican. Theiner calls attention to the disappearance of many documents which have apparently been abstracted by Clement's enemies. Ganganelli's familiar correspondence has been frequently reprinted and is much admired for its elegance and urbanity. (R. G.)

CLEMENT, FRANÇOIS (1714–1793), a French historian, was born at Brézé, near Dijon, and was educated at the Jesuit College at Dijon. At the age of seventeen he entered the society of the Benedictines at Saint Maur, and worked with such intense application that at the age of twenty-five he was obliged to take a protracted rest. He now resided in Paris, where he wrote the 11th and 12th vols. of the *Histoire littéraire de la France*. Clement also revised the *Art de vérifier les dates* (1783–92). The king appointed him on the committee which was engaged in publishing maps, acts, and other documents connected with French history, and the Academy of Subscriptions chose him as a member. He was engaged in preparing another edition of the *Art de vérifier les dates*, which was to include the period before the Christian era, when he died suddenly of apoplexy at the age of sixty-nine. (The work was afterwards brought down from 1770 to 1827 by Ds Courcelles and D'Urban.)

CLEMENTI, MUZZO (1752–1832), an Italian pianist and composer, was born at Rome in 1752. His father, a jeweller, encouraged his son's musical talent, which was evinced at a very early age. Buroni and Cordicelli were his first masters, and at the age of nine Clementi's theoretical and practical studies had advanced to such a degree that he was able to compete successfully for the position of organist at a church. He continued his contrapuntal studies

under Carpinì, and at the age of fourteen wrote a mass which was performed in public and excited universal admiration. About this time Beckford, the author of *Vathek*, persuaded Clementi to follow him to England, where the young composer lived in retirement at one of the country seats of his protector in Dorsetshire up to 1770. In that year he first appeared in London, where his success both as a composer and pianist was rapid and brilliant. In 1777 he was for some time employed as conductor of the Italian opera, but he soon afterwards left London for Paris. Here also his concerts were crowded by enthusiastic audiences, and the same success accompanied Clementi on an artistic tour to Southern Germany and Austria which he undertook about 1780. At Vienna he was received with high honour by the Emperor Joseph II., in whose presence he met Mozart, and sustained a kind of musical duel with him. His technical skill proved to be equal if not superior to that of his great rival, who on the other hand infinitely surpassed him by the passionate beauty of his rendering. Such seems to have been the opinion of most of the witnesses of this remarkable meeting, and it is confirmed to some extent by the two musicians themselves. Apropos of the connection of these great men the fact may be mentioned that one of the finest of Clementi's sonatas, that in B flat, shows an exactly identical opening theme with Mozart's overture to the *Flauto Magico*, also that at the concert given by the Philharmonic Society in commemoration of Clementi's death, the German composer's *Recordare* was the chief item of the programme. Soon after his meeting with Mozart, Clementi returned to London, where he continued for the next twelve years his lucrative occupations of fashionable teacher and performer at the concerts of the aristocracy. He also started a pianoforte manufacturing firm of his own, and the commercial shrewdness characteristic of his nation greatly contributed to the lasting success of the business. Amongst his pupils on the pianoforte during this period may be mentioned John Field, the composer of the celebrated *Nocturnes*. In his company Clementi paid, in 1804, a prolonged visit to the large cities of the Continent, including Paris, Vienna, St Petersburg, and Berlin. At the Prussian capital he made a prolonged stay, and there counted Meyerbeer among his pupils. He also revisited his own country after an absence of more than thirty years. In 1810 Clementi returned to London, but refused to play again in public, devoting the remainder of his life to composition. Several symphonies belong to this time, and were played with much success at contemporary concerts, but none of them seem to have been published. His intellectual and musical faculties remained unimpaired up to his death, which took place at Evesham, Worcestershire, March 9, 1832. Clementi has been called the "father of pianoforte playing," and it cannot be denied that the modern style of execution owes a great deal to his teaching and example. His *technique* is described as all but unequalled at his time, and remarkable even according to our present advanced notions. Moscheles, a pianist of a very different school, gives a vivid description of the effect produced by Clementi's playing. At a dinner given in his honour in 1828 the composer was induced to play once more to a larger audience. "Smart, Cramer (another of Clementi's pupils), and I," Moscheles writes in his diary, "conducted him to the piano. Every one's expectation is raised to the utmost pitch, for Clementi has not been heard for years. He improvises on a theme of Handel and carries us all away to the highest enthusiasm. His eyes shine with the fire of youth, those of his hearers grow humid. . . . Clementi's playing in his youth was marked by a most beautiful *legato*, a supple touch in lively passages, and a most unfailing *technique*. The remains of these qualities could still be discovered and admired, but

the most charming things were the turns of his improvisation full of youthful genius." Amongst his compositions the most remarkable are 60 sonatas for pianoforte, and the great collection of *Etudes* called *Gradus ad Parnassum*. As a work of instruction combining absolute artistic beauty with the highest usefulness for the purposes of teaching and self-practice the *Gradus* remains unrivalled.

CLEOBULUS, one of the Seven Sages, was son of Evagoras, and a native of Lindus, which town he ruled, though whether as monarch or as head of a republic is uncertain. He was distinguished for his strength and his handsome person, for the wisdom of his sayings, the acuteness of his riddles, and the beauty of his lyric poetry. Diogenes Laertius quotes a letter in which Cleobulus invites Solon to take refuge with him against Pisistratus; and this would imply that he was alive in 560 B.C. He is said to have held advanced views as to female education, and he was the father of the wise Cleobuline, whose riddles were not less famous than his own.

CLEOMENES (Κλεομένης), the name of three kings of Sparta, the 16th, 25th, and 31st of the Agid line. The second of these does not call for particular notice.

CLEOMENES I. succeeded as one of the two joint kings about 519 B.C. He led a Spartan force to Athens in 510 to aid the Alcmaeonids and their followers in the expulsion of Hippias. He was called in subsequently to support the oligarchical party there, headed by Isagoras, against the party of Clisthenes. He forcibly expelled from the city, on a technical charge of pollution, no less than 7000 families, and established an entirely new constitution, transferring the government from the old senate to 300 of the oligarchical party. Eventually, however, he and his small force were blockaded by their opponents in the Acropolis, and forced to capitulate and to quit the city. On his return home he at once raised a force of Spartans and allies in order to avenge his failure, and to establish a despotism at Athens in the person of Isagoras. But when the expedition had reached Elensis on its march, not only some of the subject-allies but also his brother-king Demaratus (of the Proclid junior branch) refused to proceed further, and he had to return without effecting his object. When the Ionian colonies revolted from Persia, in 500, their leader Aristagoras came to seek aid from Sparta. Cleomenes was at first inclined to entertain the tempting offers of Asiatic conquest which the Ionian, in his eagerness to secure the alliance, laid before him. But when Aristagoras, in reply to his questions, was forced to confess that Susa, the Persian capital, was no less than three months' journey inland from the sea, the king was startled, and bade his visitor quit Sparta before sunset. The Ionian then tried to bribe him; and as his offers mounted higher and higher, his little daughter Gorgo, some eight or nine years old (afterwards the wife of Leonidas) said, "Father, go away, or the stranger will corrupt you." Such at least is the story told by Herodotus, though Grote doubts its authenticity.

During a local war between Sparta and Argos, Cleomenes by a stratagem defeated the Argive forces near Tiryns. Those who escaped from the battle took refuge in a consecrated grove, which was set on fire by order of Cleomenes, and no less than 6000 men, the flower of the Argive citizens, are said either to have been killed in the battle, or to have perished in the flames,—a loss for which Argos was very long in recovering. For a reason he did not pursue his victory, but returned once to Sparta, to the great dissatisfaction of the people. One legend relates that the city of Argos successfully defended against him by its women.

When Darius (491) sent heralds to demand submission of all the Greeks, and the inhali-

had consented to give the tributary "earth and water," Cleomenes proceeded to the island to punish its treachery to the national cause. His fellow-king Demaratus, who was always jealous of him, privately encouraged the Ægeians in their resistance, and the feud between the two became so bitter, that Cleomenes brought up an old charge of illegitimacy against his colleague, and succeeded in driving him into exile. Retributive fate very soon overtook himself; he was convicted of having procured the deposition of Demaratus by tampering with the priestess of the Delphian oracle, and had to retire for safety into Thessaly, and thence into Arcadia. There he endeavoured to raise war against his countrymen, who in their alarm were weak enough to recall him. His renewed reign was not long. He soon after showed symptoms of madness, attacking violently with his staff those who came to him for audience. Some attributed this derangement to a habit of hard drinking which had grown upon him; others saw in it the just punishment of his impiety, both in his intrigues with the oracle at Delphi, and in the burning of the sacred grove at Argos and the massacre of those who had taken sanctuary there. At length he had to be placed in close confinement, when he persuaded the slave who had charge of him to bring him a knife, with which he deliberately slashed himself to pieces.

CLEOMENES III. the last of the Agid line, succeeded 240 B.C.—a king of strong and determined character, who wished to restore at Sparta the old constitution and discipline of Lycurgus, and to destroy the Achæan League. He met Aristomachus, the "captain" of the League, with a force of 5000 men against 25,000 at Palantium, but the Achæans, even with this advantage, declined the engagement. The next year he defeated them in a great battle at the foot of Mount Lycæum. He found active opponents at Sparta in the Ephors, whose anomalous authority he held to have been gradually usurped in derogation of the royal prerogative, affecting dangerously the independence of the kings, and which it was therefore his great object to crush. He succeeded in this at last by an unscrupulous *coup d'état*, surrounding the hall in which the Ephors were feasting with a body of armed mercenaries, and slaughtering them on the spot. He met with no resistance from the panic-stricken citizens, and at once proceeded to inaugurate his new constitution, abolishing the Ephorate entirely, restoring the old prerogatives of the kings, and amongst other reforms making a re-distribution of lands, and extending the franchise.

He had still to contend with the Achæan League for the supremacy of Greece. In the war which ensued he was finally defeated by Antigonus of Macedonia, who had become virtually the master of the League, in the battle of Sellasia (222), when the death-blow was given to the independence of Sparta. Cleomenes took refuge in Egypt with Ptolemy Euergetes, who received him kindly. But the succeeding Ptolemy neglected and even imprisoned him. He escaped and attempted to head an insurrection against the king, failing in which, he committed suicide.

CLEON (Κλέων), one of those popular leaders who rose to great temporary influence at Athens during the Peloponnesian War, and especially after the death of Pericles. He was emphatically a man of the people, sprung from their own ranks, his father Cleænetus having been a tanner or leather-dresser. He possessed considerable ability and was a powerful public speaker, though coarse and violent in manner and language. At first he seems to have formed one of the large party at Athens who protested against the policy of the war, and on that ground became a bitter opponent of Pericles. But his views must afterwards have changed, since we find him repeatedly urging active warlike measures in opposition to the peace party of which Nicias

and others were the representatives. He was at the height of his political influence when in 427 B.C. the revolted citizens of Mitylene, after a long siege, submitted to the Athenian forces, and the question of their punishment was discussed in a public assembly. Cleon proposed and carried, though against strong opposition, the terrible decree that all the males who were able to bear arms (Grote estimates them at as many as 6000) should be put to death, and the women and children sold for slaves. However, in a second assembly held next day, the decree was rescinded in spite of Cleon's remonstrances. A vessel hastily despatched was barely in time to stay its execution. Even as it was, a thousand of those who were considered the ringleaders of the revolt were put to death. But it was perhaps fortunate for Cleon's future influence with the Athenian commons that he had not to bear the odium of a cruelty which they might have bitterly repented. He was hated at all times by the aristocracy of Athens, and on one occasion they succeeded in convicting him of something like extortion of money from certain of the islanders who were subject to the Athenian rule. In 425, the seventh year of the war, he achieved his greatest military and political triumph. The Athenians had succeeded in cutting off from their ships and supplies a strong detachment of Lacedæmonian infantry, and blockading them in the small island of Sphacteria, off Pylos (the modern Navarino). At first it seemed that they must speedily surrender; Cleon persuaded the Athenians to dictate, as the price of their release, hard conditions of peace, which the Lacedæmonians rejected. Time wore on, and the Lacedæmonians still held out, while the blockade was maintained with great difficulty and hardship. Then Cleon came forward, and publicly declared that if he were general, he would undertake to bring the men who were on the island prisoners to Athens, dead or alive, within twenty days. Nicias, who at that time held the command-in-chief, anxious probably to discredit a political opponent, offered to take him at his word, and make over to him the command at Pylos. Cleon's own party were loud in their encouragements; and willingly or unwillingly, after obtaining a strong reinforcement of troops, and getting Demosthenes, an able general then employed on the station, joined with him in the command, he set out for the scene of operations. The historian Thucydides calls his boast "insane," but admits that he fulfilled it. Within the days named he landed on the island of Sphacteria, compelled the Lacedæmonian force there, after great loss, to surrender at discretion, and brought 300 prisoners to Athens. It is very probable that much of the credit was due to the skilful dispositions of Demosthenes, his colleague in command of the forces; but nevertheless, the man who dared and succeeded where others had so long failed must have had a well-grounded confidence in his own energy and resources. He did not long enjoy his new glories. Two years afterwards he was sent to act against Brasidas, the Lacedæmonian commander in Thracæ, and to attempt the reconquest of Amphipolis. At first he was successful; he took Torone, and made an advance upon Amphipolis; but a sudden sally of Brasidas from the town utterly routed the Athenian forces, and Cleon fell there with half his men. Brasidas was at the same time mortally wounded.

We have to judge of the character and conduct of Cleon almost entirely from the history of Thucydides and the satiric comedies of Aristophanes. But the historian, even if his judgment were not warped by the fact asserted by some writers, that Cleon had been instrumental in procuring his disgrace and banishment whilst holding a military command, had at any rate strong oligarchical prejudices, and regarded him as a restless and dangerous agitator. If we might trust the picture given of him by Aristophanes

in his comedy of *The Knights*, he is the unscrupulous and shifty demagogue, always by lies and cajolery pandering to the worst passions of his master, the populace, filching from other men their glory, and resisting all the efforts of the peace party for his own selfish ends. But, besides the general mark which all public characters presented to the licence of the satirist, he had in this case his own private grudge against Cleon, who had laid a complaint before the Athenian senate that in his comedy called *The Babylonians* he had held up to ridicule the policy and institutions of his country before the eyes of foreigners; and this in the midst of a great national war. With all his real faults, it is likely that Cleon has had less than justice done to him in such portraits of him as have come down to us. (W. L. C.)

CLEOPATRA (Κλεοπάτρα), the name of several Egyptian princesses of the house of the Ptolemies. The best known was the daughter of Ptolemy Auletes, born 69 B.C. Her father left her, at the age of seventeen, heir to his kingdom jointly with her younger brother Ptolemy, whose wife, in accordance with Egyptian custom, she was to become. A few years afterwards her brother, or rather her guardians, deprived her of all royal authority. She withdrew into Syria, and there made preparation to recover her rights by force of arms. It was at this juncture that Julius Cæsar followed Pompey into Egypt, resolved to settle there, if possible, the existing dispute as to the throne. The personal fascinations of Cleopatra, which she was not slow in bringing to bear upon him, soon won him entirely to her side; and as Ptolemy and his advisers still refused to admit her to a share in the kingdom, Cæsar undertook a war on her behalf, in which Ptolemy lost his life, and she was replaced on the throne in conjunction with a younger brother, to whom she was also contracted in marriage. Her relations with Cæsar were matter of public notoriety, and soon after his return to Rome she joined him there, in company with her boy-husband (of whom, however, she soon rid herself by poison), but living openly with her Roman lover, somewhat to the scandal of his fellow-citizens. After Cæsar's assassination, aware of her unpopularity, she returned at once to her native country. But subsequently, during the civil troubles at Rome, she took the part of Antony, on whom she is said to have already made some impression in her earlier years, when he was campaigning in Egypt. When he was in Cilicia, she made a purpose journey to visit him, sailing up the Cydnus in a gorgeously-decked galley, arrayed in all the attractive splendour which Eastern magnificence could bring in aid of her personal charms. Antony became from that time forth her infatuated slave, followed her to Egypt, and lived with her there for some time in the most profuse and wanton luxury. They called themselves "Osiris" and "Isis," and claimed to be regarded as divinities. His marriage with Octavia broke this connection for a while, but it was soon renewed, and Cleopatra assisted him in his future campaigns both with money and supplies. This infatuation of his rival with a personage already so unpopular at Rome as Cleopatra, was taken advantage of by Octavianus Cæsar (Augustus), who declared war against her personally. In the famous sea-fight at Actium, between the fleets of Octavianus and Antony, Cleopatra, who had accompanied him into action with an Egyptian squadron, took to flight while the issue was yet doubtful, and though hotly pursued by the enemy succeeded in escaping to Alexandria, where she was soon joined by her devoted lover. When the cause of Antony was irretrievably ruined, and all her attempts to strengthen herself against the Roman conqueror by means of foreign alliances had failed, she made overtures of submission. Octavianus suggested to her, as a way to his favour, the assassination of his enemy Antony. She seems to have entertained the base proposal,—enticing him to join her in

a mausoleum which she had built, in order that "they might die together," and where he fulfilled his part of the compact by committing suicide, in the belief that she had already done so. The charms which had succeeded so easily with Julius and with Antony failed to move the younger Cæsar, though he at once granted her an interview; and rather than submit to be carried by him as a prisoner to Rome, she put an end to her life—by applying an asp to her bosom, according to the common version of the story—in the thirty-ninth year of her age. With her ended the dynasty of the Ptolemies in Egypt. Besides her remarkable charms of person, she had very considerable abilities, and unusual literary tastes. She is said to have been able to converse in seven languages. She had three children by Antony, and, as some say, a son, called Cæsarion, by Julius Cæsar. (W. L. C.)

CLEPSYDRA (from κλέπτειν, to steal, and ὕδωρ, water), the chronometer of the Greeks and Romans, which measured time by the flow of water. In its simplest form it was a short-necked globe of known capacity, pierced at the bottom with several small holes, through which the water placed in it escaped or stole away. The instrument was employed to set a limit to the speeches in courts of justice, hence the phrases *aquam dare*, to give the advocates speaking time, and *aquam perdere*, to waste time; it was also very generally used instead of the sun-dial. Its defects were—first, that the flow of water varied with the temperature and pressure of the air, and secondly, that the rate of flow became less as the vessel emptied itself. The latter was remedied by keeping the level of the water in the clepsydra uniform, the volume of that discharged being noted. In the clepsydra or hydraulic clock of Ctesibius of Alexandria, made about 135 B.C., the movement of water-wheels caused the gradual rise of a little figure, which pointed out the hours on an index attached to the machine. The rate of the flow of water through an orifice being proportional to the square of the vertical distance of its upper surface from the orifice, a clepsydra of simple construction can be formed by making in the bottom of a glass cylinder an opening through which its contents can escape in twelve hours, and graduating the vessel into 144 (= 12²) equal parts. A mark made at division 121 (= 11²) from the bottom indicates the quantity of water remaining at the end of the first hour, and in like manner the squares of 10, 9, 8, and the lower numbers give the divisions to which the level of the water descends at the end of the second, third, fourth, and succeeding hours.

CLERC, LE. See LECLERC.

CLERGY, a collective term signifying the body of "clerks," that is, in English, men in holy orders. *Clericus*, however, has, both itself and its equivalents in the languages of the Catholic countries of the Continent, a wider ecclesiastical signification; while in England a use of the word, originally abusive, but now so entirely accepted as to constitute a proper secondary meaning of the term, comprises in the class of persons signified by it all those employed in duties the discharge of which demands the acquirements of reading and writing, which were originally supposed to be the exclusive qualification of the clergy.

The word is derived from the Greek κλήρος, which signifies a lot; but the authorities are by no means agreed in which sense the root is connected with the sense of the derivative, some conceiving that the original idea was that the clergy received the service of God as their lot or portion; others that they were the portion of the Lord; and others again, with, as Bingham (*Orig. Eccl.*, lib. i. cap. 5, sec. 9) seems to think, more reason, maintain that the word has reference to the choosing by lot, as was the case in early ages, of those to whom public offices were to be entrusted.

In the primitive times of the church the term canon was used as synonymous with clerk, from the names of all the persons in the service of any church having been inscribed on a roll or *kanon*, whence they were termed *canonici*, a fact which shows that the practice of the Roman Catholic Church in modern times of including all persons of all ranks in the service of the church, ordained or unordained, in the term clerks, or clergy, is at least in conformity with the practice of antiquity. The Roman hierarchy now reckons four grades of clerks:—1st, those who are merely tonsured as a sign of the ecclesiastical destination, but have received no orders of any kind; 2d, those who have received any of the four minor orders, as *hostiarii*, readers, exorcists, or acolytes; 3d, those who have received orders as subdeacons, deacons, or priests; 4th, those who have been consecrated to bishoprics, archbishoprics, or other of the higher dignities of the church. Monks, whether hermitic or coenobite, have not at any time formed as such any part of the body of the clergy. But it would seem that in the earliest ages of the church they were not deemed even eligible to the priesthood, inasmuch as it is said that St Siricius, who became Pope in the year 384, first permitted them to receive priests' orders. And we read in the epistles of St Ambrose that monks began to be ordained priests towards the end of the 4th century,—St Athanasius having been the first who ordained monks to the church of Alexandria, in which course he was imitated in the West by St Eusebius, bishop of Vercelli.

At a very early period the church began to find the necessity of taking measures to stem the evil arising from the numbers of persons who embraced an ecclesiastical career from improper motives, and often without any intention of performing any of the duties of it. Of course the same evil has vexed the church in every age. From the first moment in which she became rich, worldly men were, and have always been, found eager to share her riches without sharing her work. But in the early times, even while she was poor, the state of society was such that many unworthy motives operated to induce men who neither had nor fancied themselves to have any call to the priesthood, to seek its immunities. Not only was an ecclesiastical career the only one which offered to the studious or the lazy man any hopes of a tranquil life, and to the unwarlike immunity from the necessity of fighting, but it offered very solid and valuable privileges in the shape of specialities of jurisdiction both in civil and criminal causes, and in exemption from taxes. There is a very early decree of a congregation of bishops, ordering that no more persons shall be ordained than are needed for the service of each church. And the germ of a politico-economical idea may be observed in the reason given for the prohibition, which one would hardly have expected to find at that period, and which both ecclesiastical and civil rulers altogether lost sight of at a later time. Clerks, it was decreed, should not be unnecessarily multiplied to the prejudice of the poorer laity. Casuists of a later age have pronounced it to be sinful to receive first orders, without the intention of proceeding to take full orders. Gregory the Great likens those who entered the ecclesiastical state merely for the sake of a benefice to the crowds who followed the Saviour only because He multiplied the miraculous loaves. The Council of Trent also at its twenty-fourth sitting, chap. 4, directs the refusal of ordination to those who may with probability be supposed to desire it for other than godly reasons.

Soldiers, slaves, comedians, tax-gatherers, those who had been married twice, and all persons exercising a mean and servile occupation could not be ordained. To which classes Bingham, particularizing more accurately, adds (*Orig. Eccl.*, lib. 4):—"No stranger from another diocese, unless by letters dismissory; no one who has performed

public penance; no homicide, adulterer, or who had in time of persecution denied the faith; no usurer; no one who had mutilated any of his members; no one who had been baptized only by a medical attendant, or by a heretic, or whose baptism was in any wise irregular; no one belonging to any guild of artificers; no legal official of the Roman court; no guardian of a ward, as long as that office lasted; none who had ever suffered from insanity or diabolic possession; to which certain other canonical impediments might be added."

Bingham (*Orig.*, lib. 2, cap. 6, sec. 4) says that in some churches the clergy lived in common. Moroni says (article "Clero," *Dict. Eccles.*) that in the 4th and following centuries it is certain that almost everywhere the clergy adopted the practice of living in common. The first assertion seems to be somewhat too narrow in its scope, the second too wide. It is certain that the practice was more common than seems to be indicated by the phrase, "in some churches;" but the instance which Moroni gives in support of his assertion seems to show that the practice was far from universal. We read in a chronicle of the church of Augsburg, that in the time of Constantine, when a church was dedicated to St Afra, "clerks were established there living in common, according to the apostolic rule." Of the church of Rincotura in Mauritania, Sozomen tells us that the clerks there had "their dwelling, their table, all things, in short, in common." The venerable Bede says that Gregory I. ordered that the same rule should be observed in England. Eusebius, bishop of Vercelli, is praised by St Ambrose for restoring the practice in question in his church. Leo IX. ordered that cloisters should be established in connection with the churches in order that the clergy might live in common. Hence divers churches were anciently called monasteries, and in a history of the church of Besançon it is stated "that nothing is more common in ancient writings than to find any church called a monastery."

The immunities enjoyed by clerks of course differed largely at different times and in different countries, the extent of them having been gradually curtailed from a period a little earlier than the close of the Middle Ages. They consisted mainly in exemption from public burdens, both as regarded person and pocket, and in immunity from lay jurisdiction. This last enormous privilege, which became one of the main and most efficient instruments of the subjection of Europe to clerical tyranny, extended to matters both civil and criminal; though, as Bingham shows, it did not (always and everywhere) prevail in cases of heinous crime. The reader will find the whole subject lucidly set forth in the 5th book of Bingham's work.

This diversity of jurisdiction, and subjection of the clergy only to the sentences of judges bribed by their *esprit de corps* to judge leniently, led to the adoption of a scale of punishments for the offences of clerks avowedly much lighter than that which was inflicted for the same crimes on laymen. This part of the subject will be found fully elucidated in the 1st chapter of Bingham's 17th book; in the remaining chapter of which the penal portion of the canon law as regarding clerks is succinctly treated. (T. A. T.)

CLERGY, BENEFIT OF, an obsolete but once very important feature in the English criminal law. It was a relief of the claim of exemption from the authority of the common law tribunals on the part of the clergy, and marked the extent to which the demand was acceded to in England. The conclusion of the protracted conflict was that the common law courts abandoned the extreme punishment of death assigned to some offences, when the person convicted was a *clericus*, in holy orders, and the church was obliged to accept the compromise and let a secondary punishment be inflicted. For the more atrocious crimes

the partial exemption was not obtained, and hence offences came to be divided into clergyable and unclergyable. According to the common practice in England of working out modern improvements through antiquated forms, this exemption was made the means of modifying the severity of the criminal law. It became the practice for every convict to claim and be allowed the benefit of clergy; and when it was the intention by statute to make a crime really punishable with death, it was awarded "without benefit of clergy." A full account of the origin and progress of the system will be found in the 28th chapter of the fourth book of Blackstone's *Commentaries*. The benefit of clergy in cases of felony was abolished in the modifications of the criminal law by Sir Robert Peel in 1827 (8 Geo. IV. c. 28).

CLERMONT, or CLERMONT FERRAND, a city of France, formerly the chief town of Basse Auvergne, and now of the department of Puy-de-Dôme, is situated on a hill composed chiefly of volcanic tufa, in the fertile district of Limagne, and surrounded on the S. and W. by a line of mountains, of which the Puy-de-Dôme is the culminating point. It lies in 45° 46' N. lat. and 3° 5' E. long., and is 220 miles S. by E. from Paris. Since 1633 it is composed of the two towns of Clermont and Mount Ferrand, connected by a fine avenue of walnut trees and willows, two miles in length. The streets are generally ill laid out, narrow, and crooked; and the houses are built of dull, grey lava, which had a gloomy effect until the fashion was introduced of covering them with white-wash. It has several handsome squares ornamented with fountains, and is well supplied with water brought by subterranean conduits from Royat, a league distant. The principal public building is the cathedral, a Gothic edifice of the 13th century, and though still unfinished its interior is considered one of the finest existing specimens of Gothic architecture. The church of Notre-Dame-du-Port is curiously decorated externally with mosaic work and bas-reliefs, and is very ancient—parts of it dating from 870. Clermont has also a university-academy, a royal college, a botanic garden, a public library of 30,000 vols. (among which are several ancient MSS. of great value), museums of natural history and antiquities, two hospitals, and a theatre. The manufactures are woollen and linen goods, silk stockings, paper, cutlery, and jewellery. Being the entrepôt for the produce of the surrounding departments, the town carries on a considerable trade in hemp, flax, corn, wine, cheese, wool, hides, and cattle. In the suburb of St Allyre, to the north-west of the city, is a remarkable calcareous spring, the copious deposits of which have formed a curious natural bridge over a small stream. The population of Clermont in the end of the 18th century was about 16,000; in 1851, 30,566; and in 1872, 32,963.

Clermont (i.e., Clarus Mons or Clarimontium) is identified with the ancient Augustonemetum, the chief town of the Arverni, and it still preserves some remains of the Roman period. The present name occurs as early as the 8th century, but was at first applied to the castle alone. During the disintegration of the Roman empire Clermont suffered as much perhaps from capture and pillage as any city in the country; but it preserved its municipal liberties down to the Middle Ages, and, even after it was incorporated in the domain of its bishops, maintained the rights of its communal charter. It was the seat of no fewer than seven ecclesiastical councils, held respectively in the years 535, 549, 587, 1095, 1110, 1124, and 1130; and of these the council of 1095 is for ever memorable as that in which Pope Urban II. first formally organized the great crusade. In the national wars of the 15th and the civil wars of the 16th century the town had its full participation; and in 1665 it acquired a terrible notoriety by the trial and execution of a number of robber chieftains who had infested the neighbouring district. The proceedings lasted six months, and the episode is still known as *les Grands Jours de Clermont*. Before the great Revolution the town possessed several monastic establishments, of which the most important was the abbey of Saint Allyre, founded, it is said, by St Austramonius, the apostle of Auvergne, and the abbey of St

André, where the counts of Clermont were interred. Among the great men whom the town has produced are Gregory of Tours, Pascal, and Montlosier.

CLERMONT EN BEAUVOISIS, frequently but by mistake called CLERMONT SUR OISE, a town of France, at the head of an arrondissement in the department of Oise, is situated about 36 miles by rail to the north of Paris, near a small tributary of the Oise, called the Brèche. The town-hall and the church of St Samson date from the 13th century, and the hill on which the town is built is surmounted by an old castle partly of the 10th or 11th, now transformed into a penitentiary capable of accommodating upwards of 1000 female prisoners. The principal industries are the manufacture of cotton goods and stained paper. Clermont was an important post in the Middle Ages. It was frequently taken and retaken in the wars of the English, and in 1437 it was surrendered to them as a ransom for the great national leader La Hire. In 1569 it was sold to the duke of Brunswick by Charles IX., and about thirty years later it was resold by the duchess of Brunswick to the duke of Lorraine. In 1595 it was captured by Henry IV., and in 1615 it was held by Condé. Cassini the astronomer was a native of the town. Population in 1872, 5774.

CLERMONT-L'HÉRAULT, or CLERMONT DE LODÈVE, a town of France, in the department of Hérault, and about ten miles by rail south of Lodève, is built on the slope of a hill which is crowned by an ancient castle and skirted by the Ydromiel, a tributary of the Ergue or Lergue. It owes its importance to its woollen manufacture, which was introduced in 1678; and it also produces vinegar and vitriol, has quarries of building-stone, plaster, and lime, and deals in brandy, oil, cattle, and wool. Population in 1872, 5487.

CLEVELAND, a city and lake-port, and the capital of Cuyahoga county, in the State of Ohio, situated at the mouth of Cuyahoga River, on the S. shore of Lake Erie, in 41° 30' N. lat. and 81° 47' W. long. Next to Cincinnati, it is the largest and most important city in the State. It was founded in 1796, and named in honour of General Moses Cleveland of Connecticut, who then had charge of the surveying of this region. It was an important point in the war of 1812, and was incorporated as a village in 1814 and as a city in 1836. Its population was 1075 in 1830, 6071 in 1840, 17,034 in 1850, 43,417 in 1860, and 92,829 in 1870. The number of inhabitants in 1876 is estimated at 140,000. Of the total population in 1870, 38,815 were foreigners—including 15,856 born in Germany, 9964 in Ireland, 4008 in England, 2634 in British America, and 2155 in Austria. The city is built on both sides of the river, which is here crossed by several bridges, and chiefly on a plain from 50 to 100 feet above the lake, of which a magnificent view is thus obtained. The streets are regularly laid out, and are generally from 80 to 100 feet wide. Many of them are lined with trees, chiefly maple, whence Cleveland is known as the "Forest City." Monumental Park, near the centre of the city, contains 10 acres divided into four squares by the extension of Ontario and Superior Streets. Besides a fountain and other attractive objects, the park contains a statue of Commodore Perry, erected in 1860, in commemoration of his victory on Lake Erie in 1813. It is of Italian marble, is 8 feet high, and stands upon a granite pedestal 12 feet high. The most noteworthy buildings are that of the United States (containing the post-office, the custom-house, and the federal courts), the city hall, the county court-house, the house of correction and workhouse, the city infirmary, the Cleveland medical college, Case Hall, and the two high-school buildings. The Union Railway dépôt, an immense structure of stone near the lake shore, is one of the largest of the kind in the United States. Cleveland has import-

ant commercial advantages. Five railways pass through or terminate in the city,—including the Lake Shore and Michigan Southern, a grand trunk line between the east and the west; a division of the Atlantic and Great Western, a leading channel of communication between the east and the south-west; and the Cleveland, Columbus, Cincinnati, and Indianapolis, a direct line to Cincinnati and the south. Other lines afford communication with the extensive coal and petroleum regions of Pennsylvania. Cleveland is the northern terminus of the Ohio Canal, which extends southwards to Portsmouth on the Ohio River. For the accommodation of the lake commerce, a capacious harbour has been formed at the mouth of Cuyahoga River by extending two piers, 200 feet apart, 1200 feet into the lake. The city has an extensive trade in copper and iron ore shipped from the Lake Superior mining region, and in coal, petroleum, wool, and lumber, received by railroad, canal, and lake transportation. In 1873 the number of vessels entered in the coast-wise trade was 3238, having an aggregate tonnage of 1,053,232 tons; 3204 vessels of 1,048,196 tons cleared. The foreign commerce, which is exclusively with Canada, is considerable,—the imports amounting in 1874 to \$449,118, and the domestic exports to \$1,426,990; 316 vessels of 64,213 tons entered in this trade, and 325 of 55,152 tons cleared. The total number of vessels registered, enrolled, and licensed in this district was 466, of 86,519 tons. Twenty vessels of 11,242 tons were built during the year. About \$20,000,000 of capital is invested in manufactures, the most important industries being those of iron and the production of refined petroleum. There are also several pork-packing establishments and breweries. The city contains six national banks with a capital of \$4,550,000, and two savings banks. The government of the city is vested in a mayor and a common council of two members from each of the eighteen wards. These officers are elected by the people. The city has an efficient police, a paid fire department, a board of public improvements, and a board of health. Besides the usual county and municipal courts, the United States circuit and district courts for the northern district of Ohio are held here. The city is supplied with water obtained from the lake by means of a tunnel $1\frac{1}{4}$ mile long, and forced into a large reservoir on high ground in the western part of the city. The streets are well paved, are lighted with gas, and are supplied with sewers. The reformatory and charitable institutions are numerous and varied. The house of correction and workhouse is for the confinement of persons convicted of minor offences. The city infirmary, connected with which are a farm and a house of refuge for the care and instruction of children, besides maintaining its inmates, affords relief to outdoor poor. The city hospital is supported by money received from those patients who are able to pay and from private charity. The charity hospital is maintained partly by contributions and partly by revenue from paying patients; connected with it is a lying-in hospital. There are also a homœopathic hospital founded by the Cleveland homœopathic college, a foundling hospital, and a United States marine hospital, which is supported by appropriations made by Congress and by a tax on sailors. The Cleveland Protestant orphan asylum has an endowment fund of about \$50,000, from the interest of which, and by private contributions, it is maintained. St Vincent's orphan asylum for males, and St Mary's orphan asylum for females, are Roman Catholic institutions, accommodating about 150 inmates each. An orphan asylum is also maintained by the Jews. Among other benevolent institutions are the home for the aged poor, the home for working women under the management of the women's charitable association, and the Bethel home for destitute sailors. The children's aid society, since its organization in 1857.

has secured homes for nearly 1500 children, besides extending aid to more than 5000. There are three industrial schools, maintained partly by the city, and partly by benevolent citizens, for the benefit of destitute children. The total debt of the city in 1875 was \$7,397,500; and the property taxed for city purposes was valued at \$73,210,144. The public schools in 1874 comprised 18 primary, 17 grammar, and 3 high schools, in which were enrolled, including those in the evening schools, 19,021 pupils, with an average daily attendance of 12,085. The total number of teachers was 261. The expenditure for the public schools during the year amounted to \$382,921. Besides the above, there were enrolled in private and parochial schools 8808 pupils. Cleveland has no college or university, but there are several excellent seminaries, academies, and private schools for the advanced education of both sexes. Professional instruction is afforded by the Cleveland medical college, the homœopathic hospital college, and the medical department of the university of Wooster (each having about fifteen professors), the Ohio State and union law school, and St Mary's theological seminary (Roman Catholic). The Cleveland library association has about 11,000 volumes, the public library, supported by taxation, about 20,000, and the law library about 2000. The Bethel free reading-rooms are open to the public, and the western reserve historical society has a valuable collection of books. There are published in the city 51 newspapers and periodicals; of these 6 appear daily, 4 thrice a week, 18 weekly, 2 fortnightly, 11 monthly, and 1 every two months. Of these 7 are published in the German language, and 1 in the Bohemian. Cleveland has about 100 churches, the following being the largest denominations:—the Methodist-Episcopal 18, Roman Catholic 15, Protestant Episcopal 11, Baptist 9, Presbyterian 8, and Congregational 4 churches.

CLEVELAND, JOHN (1613–1658), a poet and satirist, was born at Loughborough. He was educated at Hinckley school, whence he repaired to Cambridge, becoming in 1634 a fellow of St John's, and being appointed college-tutor and reader in rhetoric. The Latinity and oratorical ability displayed by him in the exercise of the latter function were warmly praised by Fuller, who also commends the "lofty fancy" of his verse. He was the most distinguished and the earliest of loyal satirists. Joining the Cavaliers at Oxford, he was warmly received by the king; and having lost his fellowship and his college places, he was named judge-advocate in the garrison at Newark. The captain in command at that fortress, however, deprived him (1646) of this office, and he was fain to wander through the country depending on the alms of Royalists for bread. Arrested at Norwich, as one "whose great abilities rendered him able to do the greater disservice," he was held in durance of some months at Yarmouth, but was released at last by Cromwell (who seems to have behaved admirably towards the strolling libeller), and went to London, where he resided till his death, in the enjoyment of much consideration from his party. Cleveland, who was more highly esteemed than Milton by his contemporaries, was exceedingly popular. His serious poetry is perhaps the most extravagantly conceited in the language; his satires are more deserving, the best being the *Petition to the Lord-Protector for the Scots Rebel*. See Nichols, *History of Leicestershire*, and Cleveland's *Works*, London, 1687.

CLEVES (in German KLEVE), a town of Prussia, formerly the capital of the duchy of its own name, and now the chief town of a circle in the government of Düsseldorf, 46 miles N.W. of Düsseldorf and 12 E. of Nimeguen. It is a neatly-built town in the Dutch style, situated on the declivities of three hills known as Kirchberg, Schlossberg, and Heideberg, in a fertile district near the frontiers of

Holland, and about two miles from the Rhine, with which it has been connected since 1848 by a canal. The old castle of Schwanenburg (formerly the residence of the dukes of Cleves, and the birthplace of Anne of Cleves, one of the wives of Henry VIII.) has a massive tower 180 feet high, which was built in 1439 on the traditional site of Caesar's Tower and commands an extensive view. Cleves has two Roman Catholic and three Protestant churches, a synagogue, a gymnasium, a house of correction, and a zoological garden. The collegiate church dates from 1345, and contains a number of fine ducal monuments, among which the first place is held by that of Adolf VI. of the 14th century. The chief manufactures are linens, cottons, silks, woollens, and tobacco. To the south and west of the city a large district is laid out as a park; in the southern part, known as the Old Park, there is a statue to the memory of the founder, John Maurice of Nassau-Siegen, who governed the town from 1650 to

1679, and in the western part there are mineral wells with a pump-room and bathing establishment, which date from about 1848. The town was the seat of the counts of Cleves as early as the 11th century, but it did not receive its incorporation till 1242. It was raised, with the surrounding district on both sides of the Rhine, to the rank of a duchy by the Emperor Sigismund in 1417. On the death of Duke William in 1609, without issue, his inheritance, which also included Jülich and Berg, became the object of a violent contest between no fewer than six competitors; and it was not till 1614 that the dispute was settled by the treaty of Xanten, which assigned the duchy of Cleves to Sigismund, elector of Brandenburg, who had married a niece of the late duke. In 1805 it was ceded by Prussia to France; and in 1806 it was made a grand-duchy by Napoleon and bestowed on Murat. In 1815 it was restored to Prussia. The population of the town in 1871 was 9038.
